Researchers have not found a generally agreed upon explanation for why the developmental sequences are what they are. Input characteristics such as salience and frequency appear to play a role (Goldschneider & DeKeyser, 2001), but instructional sequences have not been shown to alter the developmental sequences in meaningful ways. Decontextualized instruction such as intensive drill or grammatical exercises that isolate language features from communicative interaction can cause learners to give the appearance of having acquired particular features "out of sequence." However, as learners are exposed to more opportunities to hear and use the language in a greater variety of contexts, they have been observed to revert to patterns that are more typical of their developmental stage (Lightbown, 1983). Such findings may reflect the widely attested difference between declarative knowledge that can be called upon intentionally when learners focus on grammatical accuracy and what they do when their focus is primarily on the meaning of their communication.

Experimental studies of the effect of instruction generally confirm that instruction facilitates progress through developmental sequences but does not alter the sequences themselves. In a study with young Italian children and English-speaking adults learning German, Pienemann (1984, 1989) concluded that instruction was most effective if it targeted language patterns that were developmentally "next" in learners' interlanguage. When the instruction targeted features that were too far beyond the patterns learners had already acquired, it

was not useful in helping them make progress. Mackey and Philp (1998) looked at progress made by adult learners whose interlocutor provided corrective feedback in the form of recasts when they made errors in using English questions. They found that learners showed improvement if they were developmentally ready to acquire the language patterns exemplified by the recasts while those who were “unready” did not appear to benefit from this opportunity.

On the other hand, some researchers have shown that instruction targeting a developmental stage that was somewhat beyond learners’ current level helped them to move to a higher developmental stage, even if they did not reach the level that was reflected in the instructional input (e.g., Spada & Lightbown, 1999). Furthermore, instruction on relative clauses has resulted in learners making progress toward developmentally more advanced clause types, sometimes acquiring the ability to use some that were even more advanced than those taught (e.g., Hamilton, 1994).

The findings of most studies on learner readiness have provided evidence that instruction can facilitate progress through developmental sequences, but it does not lead learners to skip stages in a sequence. Instruction can also serve to help learners improve accuracy, but it should be noted that progress cannot always be measured in terms of increases in accuracy. For example, asking questions with “fronting” shows that learners have moved beyond using only formulaic questions and have begun to create new sentences by manipulating word order.

The research on readiness and instruction suggests that instruction can have positive effects on language acquisition even if it is not designed to match a particular developmental sequence—a finding of considerable practical importance for at least two reasons. First, the research on developmental sequences covers only a small subset of the many linguistic features that learners must acquire. Second, students in a class will inevitably be at different developmental stages and thus not all “ready” to acquire the same features.

Learner Response Systems in Second Language Teaching

WALCIR CARDOSO

A learner response system (LRS) consists of a set of software (e.g., a PowerPoint plug-in) and hardware (a handheld device often referred to as a “clicker” and a receiver that attaches to a computer). LRSs are commonly used in large classrooms to facilitate teaching by providing an easy and immediate way of assessing students’ performance, and to create interactivity among the students and between the students and the teacher. Despite its relative absence in foreign or second language (L2) teaching and research (Cutrim Schmid, 2008; Johnson, 2010; Cardoso, in press a), the technology has recently been shown to have a strong potential for L2 acquisition as it can contribute to effective learning (Cardoso, 2010; Johnson, 2010). This entry will provide an overview of LRSs and the research and pedagogy associated with the technology.

Definition, Method of Operation, and Pedagogical Applications

LRSs have been adopted in a variety of disciplines. As a result, the technology and associated hardware appear in the literature under more than 35 different names, some reflecting the pedagogical and philosophical concerns of the respective discipline (e.g., audience-paced feedback system, audience response system, classroom feedback system, classroom response system, clickers, electronic voting machine, interactive response system, peer response system, personal response system, student response technology, wireless classroom communication system, wireless course feedback system, wireless keypad, zappers). Despite the sporadic use of LRSs over the past four decades (e.g., Boardman, 1968; Flagg, 1990), the technology has only recently become popular among teachers as a pedagogical tool, possibly due to recent developments in education (e.g., the concepts of peer instruction and active learning), some evidence that a response system may increase students’ performance if used efficiently (e.g., Hake, 1998), the popularization of the personal computer and the consequent cost reduction for both hardware and software, and the adoption of similar voting systems on TV game shows. On these shows, when contestants are unsure about the answer to a given question, they may ask the audience for the correct answer. The audience votes with their clickers and, based on the frequency distribution of the responses projected on a large screen, the contestant may then make an informed decision about the correct answer, most likely the option with the highest percentage of votes.

An LRS operates in a similar manner in the classroom. As noted above, the system consists of a set of presentation software and wireless hardware. The technology is commercialized by several companies (e.g., H-ITT, iClicker and Turning Technologies), and it is also a component of certain interactive whiteboard systems (e.g., Promethean’s ACTIVote). A typical LRS-based L2 class consists of the following steps: The teacher creates a question using the appropriate software, as illustrated in Figure 1A. Students are then asked to select an answer by clicking on the corresponding button on the keypad (Figure 1B). During the period in which the polling is open, the students’ responses are sent wirelessly (via radio frequency or infrared technology) to a receiver (Figure 1C) connected to a computer

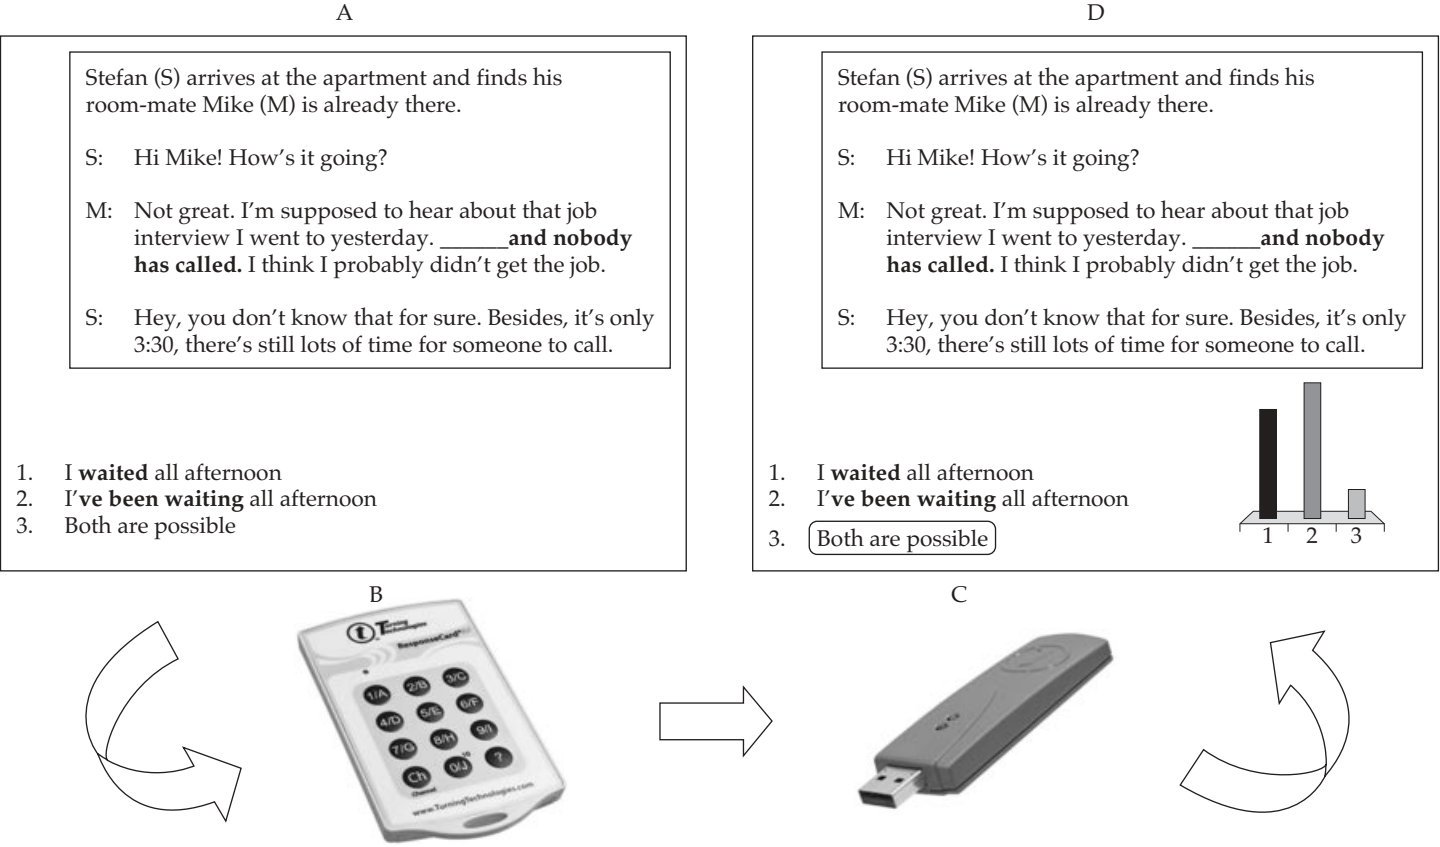

Figure 1 Schematic representation of an LRS and its method of operation. Images of clicker and receiver © Turning Technologies

which, with the assistance of the associated software, conducts some descriptive statistics including percentage distribution, mean, and standard deviation. When the voting period is closed, the results are automatically projected on a screen (Figure 1D), illustrating the correct answer, the percentage distribution of the responses across the choices, and other optional statistical information selected by the teacher. Based on these responses, the instructor may decide on how to proceed with the class: Move forward with the discussion when the majority of the students respond correctly or, if the distribution of the responses is not satisfactory (as exemplified in Figure 1D, where most students selected an incorrect alternative), engage them in discussion and peer instruction activities (e.g., students with diverging views could form small groups to attempt to convince the other members). In the latter situation, discussions and convince-your-neighbor activities can usually be followed by a re-vote process to ensure the effectiveness of the task.

The literature offers many suggestions of pedagogical applications of LRSs in a variety of educational settings and disciplines. Focusing on applications that directly relate to second or foreign-language teaching, LRSs can be used to

- assess understanding of the materials being discussed, including grammar, pronunciation, vocabulary, writing, and reading and listening comprehension (Cardoso, in press b);
- provide immediate (and reliable) feedback to the teachers and students, thus allowing the teacher to customize classes and tailor follow-up discussions based on how well students understood the material (Bruff, 2009; Cardoso, in press b);
- increase interaction in the class (e.g., via “convince-your-neighbor” activities, a survey after a debate; Mazur, 1997; Blodgett, 2006; Caldwell, 2007; Cutrim Schmid, 2008);
- monitor attendance and class participation, which consequently could lead to an increase in attendance and participation (Bruff, 2009);
- encourage the participation of students who are shy, have a speech impediment, or have fear of peer criticism (Kennedy & Cutts, 2005; Bruff, 2009);
- distribute content discussion and activities with periodic clicker-based breaks (Caldwell, 2007; Bruff, 2009);
- structure classes in a more constrained manner, in which relevant topics are preceded and followed by a set of clicker-based questions (e.g., to assess previous and newly acquired knowledge respectively; Bruff, 2009; Cardoso, in press b);
- provide additional modalities for delivering and assessing knowledge, thus catering to different learning styles (Cardoso, in press b);
- frequently test the students’ performance (including summative and formative assessments) on a regular basis and over time (Poulis, Massen, Robens, & Gilbert, 1998; Bruff, 2009);
- survey students’ opinions about specific topics, their previous experiences (e.g., level of previous exposure to the L2), or obtain general demographic information (Caldwell, 2007);
- create a fun, game-like atmosphere in the classroom (Caldwell, 2007; Bruff, 2009).

The consensus in the LRS literature is that the adoption of a response system and the pedagogical attributes associated with the technology contribute positively to the learning experience (Fies & Marshall, 2006; Caldwell, 2007; Bruff, 2009; Cardoso, 2010, in press a), as will be discussed next.

Why Use Learner Response Systems? What the Research Says

The literature on the use of LRSs is unanimous in asserting that the technology offers many pedagogical benefits, especially when used in large lecture settings. With regard to the attitudes of students and teachers toward the use of LRSs in academic settings (mostly in large undergraduate lecture halls in universities), a common denominator is the “ample converging evidence” that the response system is perceived as a tool that (a) increases students’ and teachers’ motivation and the general interest in the class (e.g., Blodgett, 2006; Caldwell, 2007), which, consequently, (b) increases involvement and participation inside and outside of the classroom (e.g., Blodgett, 2006; Poulis et al., 1998); (c) allows learners to self-assess (e.g., Barnett, 2006; Blodgett, 2006; Hoekstra, 2008) as well as (d) compare their performance in relation to that of their peers in the same class (e.g., Barnett, 2006; Blodgett, 2006; Bruff, 2009); (e) fosters interactions (e.g., Blodgett, 2006; Mazur, 1997); and, finally, (f) contributes to learning (e.g., Hake, 1998; Blodgett, 2006; Bruff, 2009).

While the vast majority of LRS studies have focused on large undergraduate-level introductory courses (Cutrim Schmid, 2007; Cardoso, *in press a*, *in press b*), there are a handful of studies that have investigated the use of LRSs in an L2 teaching environment (see Cutrim Schmid, 2007; Cardoso, 2010, *in press a*; Johnson, 2010). For example, Cardoso (*in press a*) investigated the attitudes of Brazilian students toward the use of LRSs in the teaching of English L2 vocabulary. The results of the analyses of surveys and interviews with students were consistent with the six general themes categorized in the discussion above. In the study, L2 learners also perceived LRSs as tools that increase motivation, involvement, and participation in the class, allow self-assessment and peer comparisons, promote interactions, and contribute to learning (see also Cutrim Schmid, 2007, and Johnson, 2010, for similar results in an L2 context). The study also revealed other strengths of the use of the response system, including the students’ perception of a more committed teacher (see Knight & Wood, 2005, for similar results in large biology classes), and the belief that both the quality and quantity of content coverage were increased in LRS-based instruction. The latter is a strength that distinguishes the L2 environment from the large undergraduate arts or science lecture halls that are mostly analyzed in the LRS literature: Giving students time to think and discuss their views with peers is believed to jeopardize class planning and the quantity of content coverage (Bruff, 2009). In a follow-up study reported in Cardoso (2010), the students’ perception of a potential learning gain (the sixth theme described earlier) in the acquisition of advanced (i.e., highly infrequent) vocabulary was confirmed quantitatively. In the study, the group that received LRS-based instruction outperformed in vocabulary retention the other non-LRS groups in both the posttest and delayed posttest assessments.

It is not clear why LRSs have been neglected by L2 researchers and teachers (see Cardoso, *in press b*, and Yoder-Kreger, 2009, for examples of pedagogical applications), but a possible explanation might be due to the very nature of standard L2 teaching, where classes are significantly smaller, thus leading to an increase in the level of interaction between the students and the teacher. In addition, most current L2 courses (e.g., the ones analyzed in Cutrim Schmid, 2007; Cardoso, 2010, *in press a*; Johnson, 2010) follow a communicative approach to language teaching, one that assigns the student an active role in the learning process, and that emphasizes interaction as both the means and the ultimate goal of learning a language.

It is clear from a review of the literature that research on the use of LRSs in L2 settings is still in its infancy. Despite the encouraging results obtained in the few studies available, it remains an empirical question whether they are generalizable to other communities of L2 learners. A serious limitation of many of these studies is that they rely exclusively on qualitative methods of research (e.g., classroom observations, interviews). Another

important question relates to whether LRSs should even have a place in the modern L2 classroom (e.g., to foster interactivity), an environment that is intrinsically communicative and interactive. Furthermore, the literature on LRSs is inconclusive about the extent to which learners' perception of learning gains are transferable to actual increased performance. Even the studies that show evidence of an increase in academic achievement via improved grades or better performance are wary of claiming that the gain was due exclusively to the adoption of the response system (e.g., Cardoso, 2010; Judson & Sawada, 2002). In these studies, learning gains are also attributed to factors such as the natural switch to the more student-centered environment that characterizes clicker-based instruction (Bruff, 2009), the effects of being tested affecting the participants' behavior (Caldwell, 2007), and the mere effects of using a new technology (a novelty effect; Cardoso, 2010, *in press a*).

Some Limitations

Although the vast majority of the studies indicate that LRSs are typically perceived as positive additions to a class, there are still issues that need to be addressed either in the development of the technology or in the implementation of the response system. A common complaint is the cost of the device (approximately US\$40.00), a concern that can be minimized if several courses adopt the technology, or if the institution adopts a "buy back to resell" system in which students are reimbursed 50% or more for the cost of the clickers, as is done with books. Another concern commonly reported in the literature relates to the fact that some users are not always certain that their responses were properly registered by the system due to a lack of feedback for individual responses (e.g., Cardoso, *in press a*), a problem that may increase anxiety in graded quizzes and monitored participation. In cases in which the anonymity of the responses is preserved (an optional feature in LRSs), another concern involves the confidentiality of the responses and their subsequent repercussions (e.g., some students feel that they could be penalized because they refused to participate in an activity or simply because they are often wrong in their answers). Other issues perceived as limitations include the teacher's lack of experience in using the technology (e.g., questions being asked simply for the sake of using the LRS), the feeling of a constant monitoring of attendance and participation, and the inadequate amount of time that is reserved for some LRS-based activities (e.g., too much time dedicated to a relatively easy and uncontroversial question).

While these are certainly legitimate limitations of the system, based on the available literature on learners' attitudes toward LRSs, it seems that students are prepared to tolerate the use of a not-so-perfect response system in exchange for the possibility that the technology and its associated pedagogical methods may eventually lead to an improvement in learning.

Concluding Remarks

Hand-raising techniques and oral responses are often used in the L2 classroom for assessing students' understanding and for providing the teacher and the students with immediate feedback. However, such responses are not always reliable as they can be affected by peer pressure, avoidance of unwanted exposure (and being perceived as a teacher's pet), and fear of embarrassment if the answer is incorrect. The use of an LRS eliminates this problem by giving students the chance to respond in an independent and anonymous way, thus minimizing the crowd psychology effects in which learners tend to follow the majority or the vocal minority. In addition, unlike paper-based and online quizzing applications, the feedback provided by the system is immediate to both the instructor and the learner, permitting fast and focused pedagogical interventions. Although the technology

was originally implemented to address the lack of interactivity in large classroom settings, this entry has shown that it can be easily adapted to an environment that is typically communicative and interactive in nature: the modern second or foreign language classroom.

Learner Varieties

CHRISTINE DIMROTH

The notion of *learner variety* (LV) refers to a coherent linguistic system produced by a language learner. The term highlights the fact that the standard variety as well as learner languages, dialects, and so forth are but variants of a given language and should not primarily be approached from a perspective of correctness or deviation from the “norm.” The term is often used in the plural (*learner varieties*) in order to emphasize the dynamic and unstable nature of developing learner languages. It is mainly employed in second language acquisition (SLA) studies but the concept can in principle also be applied to first language (L1) acquisition.

At each point in development, a learner passing through subsequent stages of acquisition is said to be a speaker of one particular type of LV (e.g., the *Basic Variety*, Klein & Perdue, 1997; see below). LVs do not grow arbitrarily. Despite some variation that is partly dependent on external factors like source and target language, age of the learner, type and amount of exposure, and so forth, they typically share a number of predictable lexical and grammatical properties.

The core idea of the LV approach is to treat the linguistic systems developed by learners as languages in their own right, instead of considering them as incomplete or somehow deficient and erroneous variants of “real” languages. First attempts in a similar vein are reflected in notions such as *interlanguage* (Selinker, 1972) but this term still suggests that learner languages are hybrid systems situated in-between two “real” languages (the source language (SL) and the target language (TL)). Researchers adopting the LV perspective analyze learner languages as if they had encountered them in a hitherto undiscovered population and try to describe their internal structure in positive terms.

Adopting a functionalist approach, according to which the form of learner utterances is shaped to a large extent by their function (Cooreman & Kilborn, 1991), researchers discovered a set of organizing principles on the structural, semantic, and informational level of LVs. These principles are not context independent. Rather, they are typically seen as the result of an interaction between utterance- and discourse-level constraints (Klein & Perdue, 1997).

An LV might initially be quite simple, but even at this stage it can be used for a whole range of communicative purposes. Furthermore, second language (L2) learners are not seen as struggling learners but as versed users of a given variety (Cook, 2002) that might develop further in the direction of the TL or stabilize at some point. Further development is mainly driven by the communicative limitations of the simpler varieties. Even though L2 learners do not always reach the TL competence of native speakers, Klein and Perdue propose a continuum between LVs and fully developed, or native languages, and describe the latter as “a relatively stable state of language acquisition—that state where learners stop learning because there is no difference between their variety and the input—the variety of their social environment” (Klein & Perdue, 1997, p. 308).

2 LEARNER VARIETIES

Figure 1 Distribution of source languages (SLs) and target languages (TLs) in the ESF project

The “Second Language Acquisition of Adult Immigrants” Project and Follow-Up Studies

The most comprehensive study adopting the LV perspective was conducted by the members of the “Second Language Acquisition of Adult Immigrants” project, funded by the European Science Foundation (ESF; see Perdue, 1993, for a full account of methods and results). The study had a longitudinal design (data collection over about 30 months) and was based on comparable oral production data in Dutch, English, French, German, and Swedish. All TLs thus belonged to the Indo-European language type and generalizations should be restricted to these. SLs were Finnish, Italian, Moroccan Arabic, Punjabi, Spanish, and Turkish and the combination of source and TLs was organized in a way to facilitate the study of source and TL influences (Figure 1). For each TL there were two learner groups with two different SLs (e.g., Punjabi vs. Italian speakers learning English), and for most SLs the acquisition of two different TLs was studied (e.g., Italian speakers learning English vs. German).

Participants were 40 adult immigrants who had only recently arrived in the TL country. Their SLA was mainly untutored, that is, they learned the language through daily contact with speakers of the TL in their new social environment. Oral production data were collected in free conversations and more controlled discourse elicitation tasks facilitating crosslinguistic comparisons (e.g., film retellings, personal narratives, picture descriptions, and instructions). During three cycles of data collection each task was performed three times by each participant, in order to allow for comparisons over time and proficiency levels. All data were transcribed and computerized and can be accessed via http://corpus1.mpi.nl/ds/imdi_browser.

The study focused on the following topics: the structure of utterances (Klein & Perdue, 1992), the expression of temporality (Dietrich, Klein, & Noyau, 1995), the expression of spatiality (Becker & Carroll, 2005), word formation and lexical development (Perdue, 1993), and misunderstandings and feedback (Allwood & Abelar, 1984). In follow-up studies, researchers have used the database to investigate the acquisition of finiteness and scope-bearing elements like adverbials, negation, and focus particles (Dimroth, 2002; Perdue, Benazzo, & Giuliano, 2002; Benazzo, 2003; Becker, 2005). Other studies have addressed new topics and added new language pairs, such as the acquisition of modality by Polish learners of German (Skiba & Dittmar, 1992), or the acquisition of light verbs by Chinese learners of Italian (Bernini, 2003).

The Developmental Sequence

Advocates of the LV approach emphasize that learner utterances are structured according to certain organizational regularities right from the beginning of the acquisition process. The early varieties are not very efficient communicative systems and learners have to rely on native speaker scaffolding to a large extent. LVs become more complex over time when learners try to overcome early communicative limitations.

During the acquisition process learners develop a series of increasingly complex linguistic systems. Such systems, commonly referred to as “stages of acquisition” (e.g., Clahsen, Meisel, & Pienemann, 1983), are simply called different LVs here (see below for more detail on three particularly characteristic types of LVs that have been distinguished in the literature). Importantly, newly acquired regularities are neither simply replacing earlier ones, nor just added to the ones that already exist. Rather, development during the acquisition process is seen as a stepwise reorganization of a network of form–function mappings in which changes in one part may sometimes have far-reaching repercussions for the interplay between forms and functions in other parts. The form of a particular learner utterance reflects the interaction of the organizational principles, and this interaction can change with progressive input analysis. Newly acquired formal markings (e.g., case morphology) can free other devices (e.g., word order) from their earlier function (e.g., the expression of argument structure) so that these devices can take over or concentrate on other functions (Klein & Perdue, 1997).

The earliest LV distinguished in the literature on untutored adult SLA is the so-called *Prebasic Variety*, which is attested even before the acquisition of verb–argument structure and exhibits a noun-based utterance organization. It is followed by the *Basic Variety*, in which utterance structure centers on the nonfinite verb (infinite utterance organization). While some learners stagnate at this level and only enlarge their lexical repertoire, others develop toward *Postbasic Varieties*, which are distinguished by the acquisition of finiteness and therefore show a finite utterance organization. Each variety is characterized by the interaction of a small number of organizational constraints that are largely independent of SL and TL. The transition from one variety to the next is not abrupt, but slow and gradual, and individual learners typically show phases in which different types of utterance organization coexist.

The Prebasic Variety: Nominal Utterance Organization

The earliest manifestation of untutored adult L2 learners’ attempts to communicate in the TL has been labeled the Prebasic Variety. Speakers of the Prebasic Variety are true beginners knowing only around 50 words (Perdue, 1996). These speakers produce very simple utterances that predominantly consist of unconnected nominal elements (mainly nouns, adjectives, and particles) and some adverbs and participles. There is no functional inflectional morphology and this initial LV also lacks the structuring power of verbs (e.g., argument structure, case role assignment, etc.; see Perdue, 1993).

Two types of ordering patterns are mainly used with this kind of nominal utterance organization. The first pattern consists of the juxtaposition of two noun phrases (NPs) (e.g., *meisje honger* ‘girl hunger’) or, alternatively, an NP and a prepositional phrase (PP) or an adjective (Adj) (e.g., **los* deux à la rue* ‘the two-of-them in the street’; examples from Perdue, 1996). Even though there is no formal marking of an assertion, utterances with this word order are typically used with the function of predicating a property that is encoded by the second NP/PP/Adj of a topic that is encoded by the first NP. When the information structure of such simple utterances is analyzed in context, it can be seen that learners obey a so-called “Focus Last Constraint” (Perdue, 1996). The second position of such simple predicating utterances can also be filled by affirmative or negative particles. Reference to the property predicated of the topic is then often maintained from the preceding utterance and left implicit (e.g., Native speaker: *reparieren sie selbst fahrrad oder auto?* ‘Do you yourself repair bicycle or car?’; Learner: *auto nein, fahrrad ja* ‘car no, bicycle yes’; see Becker, 2005). In addition to word order, learners can use intonation to express the intended information structure by placing a focal pitch accent on the second constituent. A different utterance pattern is used to introduce a new referent into the discourse. The NPs referring

to the new referents are then preceded by optional adverbials (e.g., *aujourd'hui ici quatre familles* 'today here four families').

Research has found that learners use the restricted formal repertoire available at the Prebasic Variety stage (mainly word order and suprasegmental means) in a systematic way when producing simple utterances and marking their information structure in a given discourse context. Perdue (1996, p. 148) maintains that "These learner varieties are highly structured. If one wishes to do justice to the continuity of the acquisition process, one cannot afford to ignore systematicity just because the adopted theory cannot accommodate it. An appeal to 'fragments' and 'non-sentences' amounts to an admission of a failure in analysis."

The Basic Variety: Infinite Utterance Organization

At the subsequent stage, the Basic Variety, learners extend their lexical repertoire and reduce their need to rely on the interlocutor's scaffolding. This is mainly achieved through the integration of verb phrases in the LV (functional elements or inflectional morphology are still not used productively), which has far-reaching consequences for the structure of the learner utterances.

Word order is now no longer exclusively motivated by information structure principles but gains an additional function: It is used to signal the argument structure of verbs. Speakers of the Basic Variety obey the so-called "Agent First Constraint" while the "Focus Last Constraint" known from the preceding stage is still valid. In addition to these semantic and pragmatic constraints, word order at the Basic Variety stage is characterized by a small number of phrasal constraints which define the patterns in which lexemes may occur. There are basically three phrasal patterns (see Klein & Perdue, 1992, for details):

1. NP1-V-(NP2)-(NP2)
2. NP1-Copula-NP2/PP/Adj
3. V-NP2

The noun phrases distinguished here as NP1 and NP2 have the following internal structure:

NP1: Proper name, determiner + noun, pronoun, zero anaphor

NP2: Proper name, determiner + noun

Importantly, learners at the Basic Variety stage do not distinguish between the finite and nonfinite component of the verb. Infinite utterance organization—that is, the dominance of uninflected verbs or infinitival forms—is a defining characteristic of the Basic Variety. The presence of verb–argument structure allows the learners to express inherent lexical aspect (*Aktionsart*), but morphological means for the expression of tense and aspect are still lacking.

Basic Variety speakers typically possess a relatively rich repertoire of temporal adverbials that allow them to specify a time span. In combination with principles of discourse organization (e.g., the principle of natural order, whereby the order of narration follows the order of events), this enables learners to express relatively complex temporal relations, including continuation and iterativity (Starren, 2001). About one third of the participants in the "Second Language Acquisition of Adult Immigrants" project (Perdue, 1993) did not develop beyond the Basic Variety.

The Postbasic Variety: Finite Utterance Organization

Conflicts between the constraints that are valid at the Basic Variety stage are seen as the most prominent driving forces toward further development. There are discourse contexts

in which the semantic and the pragmatic constraints described above cannot be satisfied at the same time, such as when an agent that should be mentioned first (according to the “Agent First Principle”) is in focus and should therefore be mentioned last (according to the “Focus Last Principle”). Learners must then either decide to violate one of the principles or develop further disambiguating devices. The same holds for the expression of more complex temporal relations, such as when the inherent temporal properties of a verb are at variance with the aspectual meaning intended by the learner, or when the order of narration is not in accordance with the principle of natural order.

Competition between constraints is the motivation for further morphosyntactic development that is geared to the specificities of the TL. At the Postbasic Variety stage, pronominal forms become productive, focalization devices (e.g., cleft structures) are acquired, and finite morphology on the verb emerges, allowing the learner to mark grammatical agreement, tense, and aspect. The acquisition of morphological finiteness marking goes hand in hand with a reorganization of utterance structure (hence “finite utterance organization”) that has consequences for the integration of scope-bearing elements, like negation, scope particles, and adverbials (see Dimroth, 2002; Perdue et al., 2002; Benazzo, 2003), because a more hierarchical structure arises that offers new positions and means to disambiguate the scope. The acquisition of finiteness can therefore be seen as a major turning point. Finiteness is typically first marked on auxiliaries and other light verbs and only later on lexical verbs (Jordens & Dimroth, 2006; Schimke, 2008; Verhagen, 2009).

The Special Status of the Basic Variety

Within this tradition of looking at LVs as coherent linguistic systems, a particular status has been ascribed to the Basic Variety as a highly functional and stable means of communication which many learners use for a long period. Klein and Perdue (1997, p. 303) believe “that the Basic Variety not only plays a particular role in the process of second language acquisition but also . . . represents a particularly natural and transparent interplay between function and form in human language.” This conclusion is based on the observation that the structures attested at the Basic Variety stage deviate from SL and TL in systematic ways. The untutored adult learners in the “Second Language Acquisition of Adult Immigrants” project consistently developed a communicative system exhibiting a shared body of core organizational principles, despite their different SLs and—even more astonishing—despite the fact that they were exposed to different TLs. With the exception of the lexicon the TL properties were found to become relevant only after the Basic Variety stage (see the results summarized in Perdue, 1993).

Advocates of an LV approach therefore maintain that the “learning choices” made by untutored adult L2 learners cannot be a result of the surface properties of the input language alone, but must also be informed by principles specific to human language and communication. These claims are mainly based on the similarities between LV systems that were developed by learners with different SLs and TLs (Klein & Perdue, 1997).

Because of their independence of SL and TL, the structural constraints operating at the Basic Variety stage have been interpreted as representing the most central aspects of linguistic organization, or, as Klein and Perdue (1997, p. 304) put it, as directly reflecting “the necessary, rather than the more accidental, properties of the human language capacity.” The authors also discuss whether the Basic Variety should be seen as an instantiation of universal grammar (UG) and propose that, within Chomsky’s minimalist framework, it could be characterized as an I-language in which all (formal) features are weak. This would explain the absence of inflectional morphology and the lack of movement attested at the Basic Variety stage. In the course of further development, particular features would then have to be “strengthened” in accordance with principles identified in the TL input.

Critics of this interpretation deny the special status attributed to the Basic Variety for different reasons. Schwartz (1997) challenges the lack of L1 influence and points to word order variation, among other things, attested in the data from learners with different SLs. Comrie (1997) wonders whether the Basic Variety can be seen as a real language. He points out that native languages serve both a cognitive and a communicative function, and argues that only the latter is true for the Basic Variety.

Bierwisch (1997) and Meisel (1997) discuss the question of whether the Basic Variety can be equated with full-fledged native languages in the sense that both originate from the same human language faculty. Bierwisch (1997) argues that communication systems that are so dramatically reduced in complexity could be built up with the help of domain-general cognitive strategies alone and do not necessitate the language-specific resources that are indispensable for native language acquisition. Meisel (1997) disputes the claim that UG is available to L2 learners in the first place and corroborates this by pointing to developmental differences between L1 and L2 acquisition.

These points, as well as other open questions (e.g., the role of the age factor), need further investigation. What the critical discussion shows is that the study of elementary LVs not only informs us about the process of SLA, but can also help us to gain more insight into the functioning of the human language capacity in more general terms.

Learning to Read in New Writing Systems

KEIKO KODA

The ultimate goal of reading is to construct text meanings based on visually presented information. Integral to this goal is decoding competence—that is, the ability to extract linguistic information from printed words. This entry explains how decoding contributes to text comprehension; how decoding development is facilitated by orthographic knowledge; how the knowledge acquired in one language affects decoding development in another language; and how orthographic knowledge can be promoted in second language (L2) learners through classroom instruction.

Role of Decoding in Reading Comprehension

In this context, “decoding” specifically refers to the process of extracting phonological information from printed words. One may wonder why phonology is involved because reading comprehension does not require overt vocalization. Phonology is necessary for retaining information in working memory, wherein extracted linguistic segments are integrated into larger text units, such as phrases and sentences. Research has shown that phonologically encoded information is more durable than any other form of representation and retained longer in working memory (e.g., Just & Carpenter, 1980). Thus, visually presented words must be converted into their phonological forms.

Successful comprehension, moreover, demands high levels of efficiency in each of its component operations. It is well documented that a principal hurdle in complex cognitive activities, such as reading, is that the number of mental operations that can be simultaneously activated is limited (e.g., Schneider & Shiffrin, 1977). To keep multiple operations concurrently active, some of those operations must be automated (e.g., Perfetti, 1985; Daneman, 1991). Decoding is a good candidate for automaticity because it involves systematic mappings of featural information (e.g., LaBerge & Samuels, 1974; Adams, 2004). Because automated execution requires little attentional capacity, well-developed decoding can leave sufficient room for other, more resource demanding, operations.

Role of Orthographic Knowledge in Decoding Development

Efficient decoding implies effortless access to a word’s phonology. Although it may seem that good readers recognize many words instantly and holistically with little attention to their internal components, they engage in substantial analysis and manipulation of sublexical information, such as phonemes and syllables (e.g., Ehri, 1998). Research has demonstrated that skilled readers are more adept at pronouncing individual letters and nonsense letter strings than poor readers (e.g., Wagner, Torgesen, & Rashotte, 1994); and that the absence of even a single letter in a word considerably reduces their decoding efficiency (e.g., McConkie & Zola, 1981). Clearly, seamless decoding is attributable to word segmentation and analysis, rather than to whole-word retrieval. Decoding thus is an analytical and constructive operation and it can be significantly enhanced by orthographic knowledge—that is, by

DOI: 10.1002/9781405198431.wbeal1171

understanding how phonological information is encoded graphically in the writing system (e.g., Seidenberg & McClelland, 1989; Ehri, 1998).

Orthographic knowledge, like other facets of linguistic knowledge, emerges from input processing experience, involving the detection and abstraction of structural regularities implicit in input (Ellis, 2002). English orthographic knowledge, for example, is defined as “an elaborate matrix of correlations among letter patterns, phonemes, syllables, and morphemes” (Seidenberg & McClelland, 1989, p. 525). Accordingly, its acquisition is seen as the process of forming interletter associations through cumulative print exposure and experience. That is to say, the more frequently a particular pattern of letter sequences is experienced, the stronger the connections that hold the letters together. Under this view of learning, orthographic knowledge, while boosting decoding, becomes increasingly refined through decoding experience.

As a by-product of print processing experience, orthographic knowledge reflects the grapheme-to-phonology relationship in the language in which reading is learned. As such, the knowledge varies across languages in two dimensions: orthographic representation and systematicity in symbol-to-sound correspondences. *Orthographic representation* refers to the linguistic unit that each graphic symbol represents in each language. In alphabetic systems, for example, each letter stands for a phoneme—either a single consonant or vowel. In logographic systems, in contrast, each symbol represents a morpheme, corresponding holistically to the sound and meaning of the morpheme. *Orthographic systematicity* pertains to the degree of regularity in grapheme-to-phonology relationships. In “systematic” systems (e.g., Spanish and Serbo-Croatian), each symbol encodes only one phoneme, constituting a phonologically regular system with highly transparent grapheme-to-phoneme relationships. In contrast, in phonologically “opaque” systems, such as English and Chinese, the grapheme-to-phonology relationships are far less transparent because they preserve morphological information at the expense of phonological regularity.

The psycholinguistic grain size theory (Ziegler & Goswami, 2006) provides a plausible explanation of how variations in decoding development occur in conjunction with the grapheme-to-phonology relationships in typologically diverse writing systems. In all languages, reading acquisition demands learning to map spoken language elements onto the graphic symbols that encode them. According to the theory, the optimal size for the required mappings is determined by the amount of orthographic information required for decoding. In phonologically transparent, or regular, systems, decoding demands little orthographic information. The grain sizes in these systems are small at the phonemic level. In contrast, in phonologically opaque systems, decoding requires far more orthographic information, thus, necessitating larger grain sizes, such as syllables, rimes, and even morphemes. These variations have significant implications for L2 decoding development.

L2 Decoding Development

It is well documented that decoding skills, once acquired, transfer across languages and are assimilated in reading in another language (Koda, 2005). Through transferred skills, first language (L1) orthographic knowledge contributes directly to the formation of L2 orthographic knowledge, and then, to L2 decoding development indirectly through L2 orthographic knowledge. Such crosslinguistic impacts bring about several distinct characteristics uniquely associated with L2 decoding, including (a) L1-induced variations, (b) L1–L2 orthographic distance effects, and (c) facilitation from universally shared resources.

When transferred, L1 decoding skills, shaped differentially in diverse languages, variably cope with the demands imposed by L2-specific orthographic properties and thus engender systematic variations in L2 decoding behaviors. Experimental studies have shown that adult

L2 learners with alphabetic and logographic L1 backgrounds are differentially sensitive to experimental manipulations designed to alter phonological transparency (Koda, 1989, 1990, 1993; Ryan & Meara, 1991); and more critically, that the observed variations are directly identifiable with the participants' respective L1 orthographic backgrounds (e.g., Brown & Haynes, 1985; Green & Meara, 1987; Koda, 1998, 1999; Akamatsu, 2003). Given that those L1-related variances are systematic and predictable, they indicate that linguistically heterogeneous learners are likely to encounter diverse processing problems in learning to read in a new language involving a typologically different writing system.

Because orthographic properties differ across languages, transferred decoding skills must undergo functional adjustment. The amount of modification however varies across diverse learners groups (e.g., Muljani, Koda, & Moates, 1998). When L1 and L2 are similar, transferred decoding skills are serviceable with little adjustment. However, when the two languages are typologically distant, substantial modification is necessary for L1 skills to be optimally functional in L2 decoding (Koda, 1999; Hamada & Koda, 2008, 2010). Clearly, orthographic distance directly relates to the rate in which L2 decoding skills mature, and thus, explains efficiency differences in L2 decoding among learners with similar and dissimilar L1 backgrounds.

Foundational building in learning to read is impelled by a set of universal principles (Perfetti, 2003). Because the foundational skills are required of all learners in all languages, once developed, they become available as shared resources in learning to read in any additional language. The notion of shared competence is manifest in strong crosslinguistic relationships in decoding skills repeatedly shown in studies involving school-age children learning to read two related (Durgunoglu, Nagy, & Hancin, 1993; Gholamain & Geva, 1999; Wade-Woolley & Geva, 2000; Branum-Martin, et al., 2006), as well as unrelated (Bialystok, McBride-Chang, & Luk, 2005; Wang, Perfetti, & Liu, 2005) languages. The clear implication is that L2 reading development is accelerated, in highly specific and thus restricted ways, by prior reading experience because it allows learners to usefully exploit the resources shared across languages.

Pedagogical Implications

Given that L2 learning to read entails multiple diversities, it is clear that no one method works optimally for all L2 learners. Ideally, teachers should recognize that prior literacy experience has lasting impacts on L2 reading development. For example, they should be aware that the extent that L1 and L2 writing systems share similar properties differs among learners with varying L1 backgrounds; and that orthographic distance explains disparate rates in which L2 decoding skills develop. Although it is not reasonable to expect teachers to know every possible L1-based disparity among their linguistically heterogeneous students, such awareness is crucial for recognizing the diverse needs of their students. If instruction is based solely on the monolingual models developed in L1 reading research, disregarding the impediments stemming from L1-induced variations, discrepancies are likely to occur between the monolingual norms assumed in the instruction and the processing difficulties that L2 learners actually encounter.

Because input experience is the key determinant of what is learned and how well it is learned, decoding development can be promoted by improving the quality and quantity of print input available to learners. One way of increasing input *quality* is to design instructional activities and materials so as to highlight the orthographic unit most reliably representing phonology in the language, such as rhymes in English and phonetic radicals in Chinese characters. Augmenting input *quantity* is critical, but insufficient, because decoding efficiency can be achieved only through cumulative symbol-to-sound mapping experience. Although

simulating print processing experience typically found in L1 reading development is not feasible, it is certainly possible to provide learners with ample opportunities to engage in input analysis and mapping practice.

Leech, Geoffrey

SEBASTIAN HOFFMANN

Geoffrey Neil Leech was born in Gloucester, in the west of England on 16 January 1936. After attending Tewkesbury Grammar School, he studied at University College London (BA honors in English Language and Literature, 1959; MA in Linguistics, 1963), where he also took up his first academic teaching position as an assistant lecturer—later lecturer—in 1962. His first monograph, *English in Advertising: A Linguistic Study of Advertising in Great Britain* (Leech, 1966), grew out of his MA thesis, which was submitted in 1963.

In addition to the study of register, Leech's main research interests during the 1960s were stylistics and semantics. In the former field, he broke new ground in the UK in successfully applying modern linguistic methods to the study of literary language, combining two approaches whose exponents had traditionally been rather reluctant to join forces. His book *A Linguistic Guide to English Poetry* (Leech, 1969a) is testimony to the belief that such a rapprochement is a fruitful exercise, a conviction that was later forcefully reiterated in *Style in Fiction: A Linguistic Introduction to English Fictional Prose* (Leech & Short, 1981) and which has continued to be influential on Leech's research interests up to the present day.

In the area of semantics, Leech was initially influenced by M. A. K. Halliday, the first professor of linguistics at UCL. However, he soon developed his own theory of semantics, which was to form the basis of his PhD thesis entitled *An Approach to the Semantics of Place, Time, and Modality in Modern English*. This was later reworked into a book with the title *Towards a Semantic Description of English* (Leech, 1969b).

Leech's first exposure to corpus linguistics occurred during his time at UCL, where he was closely associated with the Survey of English Usage (SEU), a research center founded by Randolph Quirk in 1959 that was attached to the Department of English Language and Literature. Together with key researchers such as David Crystal, Jan Svartvik, and Sidney Greenbaum, Professor (later Lord) Quirk was at that time in the process of compiling a one-million-word collection of spoken and written data, part of which was later to be distributed in electronic format as the London–Lund Corpus.

Work by the SEU also formed the impetus and basis for *A Grammar of Contemporary English* (GCE), the first scholarly grammar of English written by a predominantly British authorship in the 20th century (Quirk, Greenbaum, Leech, & Svartvik, 1972). At a time when linguistics was dominated by Noam Chomsky's highly theoretical views of the generative nature of grammar, this work provided a much-needed bridge between academia and the practical needs of the educator in the English classroom. Although not as explicitly corpus-based as the more recent *Longman Grammar of Spoken and Written English* (Biber, Johansson, Leech, Conrad, & Finegan, 1999), GCE was a decidedly descriptive work. In particular, the four authors took the position that grammar is inherently indeterminate. This is reflected, for example, in their discussions on gradient boundaries and multiple class membership. In other words, in cases where competing structural analyses could be put forward, the authors argue that lexical items may belong to more than one grammatical category, and that the boundary between these categories is blurred. Thus, for example, a word like *washing* in *washing machine* is arguably a noun or an adjective and no attempt needs to be made to find arguments that eliminate the indeterminacy. Another example is the case of complex prepositions (e.g., *in front of*, *in common with*), for which a

gradient scale of “cohesiveness” is proposed (pp. 302–4). Thus, *in spite of* behaves in every way like an indivisible unit (and therefore like a simple preposition) while *on the shelf by (the door)* is shown to consist of grammatically separate units and is therefore located at the other extreme of the scale. A considerably revised and updated edition of GCE was published as *A Comprehensive Grammar of the English Language* (Quirk, Greenbaum, Leech, & Svartvik, 1985), which quickly established itself as one of the main reference grammars of English.

In 1969, Leech moved to the north-west of England to take up a post at the recently formed University of Lancaster, where he is still based at the time of writing. He was promoted to professor of linguistics in 1974 when he also became the first head of the then newly founded Department of Linguistics and Modern English Language, which was one of the first departments in the UK to offer a BA in Linguistics. As early as 1970, however, Leech took a leading role in defining the future direction of corpus linguistics in general and linguistic research at Lancaster in particular by suggesting the creation of a British analogue of the Brown Corpus, the first computer corpus of (American) English that had recently been completed at Brown University.

Due to the basic computing facilities of that time, as well as limited financial resources, the project proceeded fairly slowly. The biggest obstacle, however, proved to be apparently insurmountable difficulties in obtaining copyright from publishers for the 500 text samples to be used in the corpus. In 1977, Leech met with a number of colleagues (including Jan Svartvik, W. Nelson Francis and Stig Johansson) in Oslo to find a solution to this impasse, which resulted in the creation of the International Computer Archive of Modern English (ICAME); see also Leech and Johansson (2009). The year before, work on the corpus had already been moved to Norway, where Stig Johansson had offered to complete the final stage of the project. Writing as secretary of ICAME, Johansson finally managed to obtain copyright clearance for the texts and the corpus was completed and distributed in 1978 under the name of “Lancaster–Oslo–Bergen Corpus” (now more familiar by its acronym LOB). With its annual conference meetings and a distribution and information center based in Bergen, ICAME (later renamed International Computer Archive of Modern and *Medieval* English) continues to thrive as the longest-established association of corpus linguists. In 2009, a jubilee 30th conference meeting was held in Lancaster, with Leech as one of the co-organizers of the event.

The 1980s and 1990s saw several innovative corpus creation and annotation projects carried out at Lancaster University under the direction of Leech and principal collaborators such as Geoffrey Sampson (Linguistics) and Roger Garside (Computing Department). These include:

- The automated part-of-speech tagging of the LOB corpus (successfully completed in 1983, in cooperation with Stig Johansson, Oslo). This resulted in CLAWS, the first tagger to use statistical algorithms, which radically improved the accuracy of automatic tagging to approximately 96%.
- The creation of a small but richly—prosodically and grammatically—annotated Corpus of Spoken English (52,000 words).
- The automated parsing of corpus data, initially on the basis of the LOB corpus, later on much more substantial text collections (more than 300 million words) in cooperation with IBM (1987–91; see Black, Garside, & Leech, 1993).
- The automated part-of-speech tagging of the British National Corpus (BNC), a 100-million-word corpus of spoken and written British English.

More recently, Leech has been involved in the creation of two further small-scale corpora (each one million words) to add to what is commonly referred to as the “Brown family of

corpora," that is, the original Brown and LOB corpora from the 1960s, and their more recent clones Frown and F-LOB, created by Christian Mair and Marianne Hundt, Freiburg, containing data from the early 1990s. In collaboration with Nick Smith (University of Salford, UK) and Paul Rayson (Lancaster), Leech oversaw the compilation of BLOB-1931 (for "before LOB"), covering British data from around 1931, while work on a 1901 British match of the corpus was started in 2008.

In addition to corpus compilation, Leech's research activities have consistently embraced a variety of fields of linguistic enquiry. Thus, in addition to the already mentioned work in stylistics, his research focus expanded in the 1970s to the border between his earlier research area of semantics and the emerging field of pragmatics. Eventually, this developed into a full-blown theory of pragmatics as laid out in *Principles of Pragmatics* (Leech, 1983). At the time of writing, Leech has resumed work in this field, particularly in the area of politeness theory, and is preparing a monograph with the working title *Politeness in English: In Relation to Other Languages* (Leech, in press).

Another prominent area of interest has been the description of English grammar. Apart from the three reference grammars Leech has coauthored, the publication of the *Communicative Grammar of English* (Leech & Svartvik, 1975, revised 1994 and 2002) deserves special mention in this context. It is his most successful book to date, with over 250,000 copies sold so far. Grammar is also the focus of his latest book, entitled *Change in Contemporary English: A Grammatical Study* (Leech, Hundt, Mair, & Smith, 2009), which represents the culmination of Leech's corpus-based research on recent grammatical changes in English.

While he has remained loyal to Lancaster for over 40 years, Leech has been active on an international scale for all of his working life. Thus, he spent a year as a Harkness Fellow at the Massachusetts Institute of Technology (MIT) (1964–5) and six months as visiting professor at Brown University, USA (1972). He also led a three-month visit of an academic delegation to China in 1977, at a time when China had relatively little contact with the West. Other countries where he held teaching appointments include Australia, France, Japan, New Zealand, and Singapore.

Geoffrey Leech officially retired in December 2001. However, he continues to take an active role as emeritus professor in both research and PhD supervision, and the regular visits to his office in the department at Lancaster University are only interrupted when he is away to give a series of lectures or to attend a conference. Today, Leech lives with his wife Fanny about 20 miles north of Lancaster in Kirkby Lonsdale, in a 300-year-old house full of period furniture and close to the river Lune—hence the (for many readers somewhat opaque) title of a Festschrift in Leech's honor: *Corpus Linguistics by the Lune: A Festschrift for Geoffrey Leech* (Wilson, Rayson, & McEnery, 2003).

This biographical entry is heavily based on Leech (2002). An updated version of this autobiographical entry was kindly provided to the author by Geoffrey Leech.

Legal Disputes Over Second Language Instruction in the United States

SANDRA DEL VALLE

Legal disputes over second language instruction in the United States began as far back as the World War I era and have continued into the 21st century. For the most part, litigation has pitted language minority parents seeking second language instruction in the public schools for their children as part of a basic, quality education, against school districts or state actors which seek to negate or limit those rights.

The first significant language rights school case occurred in the World War I era, albeit in the private school context. In 1923 the Supreme Court heard the case of a German language Bible schoolteacher who was prosecuted for violating a Nebraska statute that prohibited the teaching of German, even in private schools (*Meyer v. Nebraska*, 1923). The US Supreme Court decided that the law was unconstitutional because it violated the privacy interest of parents to decide in what language their children would be taught in private schools. Among language rights advocates, the most important feature of the court's decision was that the Constitution protected all, including those who were not born with "English on the tongue" (*Meyer v. Nebraska*, 1923, p. 401).

It would be decades before the Supreme Court took up the issue of second language instruction again. In the meantime, the lower courts were fashioning remedies and determining the legal rights of language minority students. In *US v. Texas Education Agency* (1976), a trial court ordered the Texas Education Agency to implement language programs "that introduce and develop language skills in a secondary language while at the same time reinforcing and developing language skills in the primary language" (p. 26). Essentially, the Texas court ordered a dual-language program for all students. Meanwhile, however, the Supreme Court decided in a different context that there was no federal constitutional right to an education (*San Antonio Ind. School Dist. v. Rodriguez*, 1973). Any hope that the language rights of language minority children could be part of a federal constitutional scheme were dashed. For other similar negative cases, see *Cisneros v. Corpus Christi Ind. School Dist.* (1972) and *US v. Texas Education Agency* (1976).

In 1974 the Supreme Court did revisit the issue of education for language minority students. In *Lau v. Nichols* (1974), the Supreme Court was asked to decide whether the San Francisco Unified School District was violating federal law, including the Constitution, when it provided neither Chinese-language instruction nor English as a second language classes to its Chinese-dominant students. The children sat in English-only classrooms without understanding the instruction—it was an education in form only. The Supreme Court found that the school district did indeed have to take action to educate the children although it did not mandate any specific instructional program. Not surprisingly, the court did not find a constitutional violation but only a violation of Title VI of the Civil Rights Act and of California's education law. The court had relied upon regulations issued by the Department of Health, Education and Welfare (HEW), the agency with authority over Title VI, that equated discrimination based on national origin with the failure to provide English-language learning programs for language minority children. Afterward, HEW's Office of Civil Rights (OCR) interpreted the *Lau* decision as mandating bilingual education. In the years that followed, OCR compelled school districts across the nation to create

bilingual programs. In New York City, a bilingual program for Spanish-dominant students was mandated by a federal court and was quickly extended to all other language minority groups under an agreement reached with OCR.

In 1974, Congress passed the Equal Educational Opportunities Act (EEOA). Section 1703(f) of the Act warned school districts that they had to “take appropriate action to overcome language barriers that impede equal participation by its students in its instructional programs.” Since “appropriate action” was not defined and *Lau* did not mandate any particular instructional design, OCR, an administrative agency, was left to carve out a special legal space for bilingual education. It was a precarious hold and it could not last.

Indeed, the 1980s ushered in a more restricted view of Title VI and of the rights to bilingual education. As the Reagan Administration’s new conservatism swept the country, courts grew uncomfortable with the role of the federal government in mandating instructional programs. Courts around the country took up the mantra of “local control”: minimal federal oversight as school districts decided for themselves how to run their schools. This attitude was exemplified in the instructional context by *Castaneda v. Pickard* (1981) when a federal appeals court stated unequivocally that bilingual education was not mandated under *Lau*. Relying instead upon the EEOA, the court developed a three-prong test to measure the legality of a district’s efforts: (a) the instructional model adopted by the district must be based on a sound educational theory; (b) the theory must be implemented effectively with sufficient resources and personnel; (c) after a trial period, the program must be effective—students must be achieving in English and academically. Although *Castaneda* was a clear refutation of OCR’s interpretation of *Lau* and its administrative support for bilingual education, the court still provided a reasoned analysis for evaluating programs and held districts to educating language minority students in a comprehensive way.

The 1990s were even less hospitable to bilingual education. The nation was experiencing its highest immigration rate in decades and many states were responding by introducing English-only legislation and trying to deny basic public services to immigrants. California was swept up in the anti-immigrant furor. In 1994, its voters passed Proposition 187 which sought to deny undocumented immigrants access to public schools, hospitals, and social services. In 1998 voters adopted Proposition 227 which essentially prohibited bilingual education, even providing civil remedies against teachers who violated the law. In its place, intensive English classes were to be provided until students reached a “working knowledge” of English. Although lawsuits were brought against the state and school districts, most of the cases were lost, even under the *Castaneda* standards. For example, in *Valeria G. v. Wilson* (1998), the trial court in California refused to strike down Proposition 227 programs on the grounds that under *Castaneda* school districts could try a variety of methods to teach its language minority students English even if it foreclosed them from choosing bilingual education and even if it privileged learning English over other goals. Likewise, in *California Teachers Association v. Davis* (1999), teachers filed a First Amendment challenge against the school district’s Proposition 227 program because the prohibition on speakers speaking or teaching language other than English to their students “chilled” their First Amendment right to speak the language of their choice. The court did not sympathize with the teachers stating that the law applied only to instructional and curriculum matters, areas over which schools can dictate teacher speech. After the success of the language-nativists in California, Arizona and Massachusetts quickly followed suit, also passing anti-bilingual education laws.

The 21st century saw the growth of the standards-based and assessment system for educational reform. In 2000, Congress passed the No Child Left Behind Act (NCLB) which codified a standards and assessment system. The promise of the EEOA and *Castaneda* and the restricted ideology of the NCLB clashed in an Arizona case. In *Flores v. Arizona* (2000), parents of Spanish-dominant children brought a lawsuit against Nogales Unified School

District (NUSD), one of the poorest districts in the state and in desperate need of resources to educate its language minority students. The parents complained that the district was failing their children: neither teaching them English nor assuring that they met academic standards. The *Flores* court found that NUSD was not meeting its obligations under *Castaneda* despite its best efforts. The state's funding system was simply starving Nogales of needed funds.

After years of struggling to establish a more equitable funding structure, NUSD was again in court in 2009. This time, the litigation made it to the Supreme Court in *Horne v. Flores* (2009). Opponents of bilingual education weighed in arguing that the EEOA should be replaced with the requirements of NCLB. In his decision, Justice Alito specifically targeted bilingual education, calling it an unsuccessful methodology. Relying on *amicus* briefs submitted by opponents of bilingual education, he claimed that there was "documented, academic support for the view that [structured English immersion] is significantly more effective than bilingual education" (*Horne v. Flores*, 2009, p. 2601). Ultimately, the court upheld the EEOA but never before had the court sided with one kind of instructional methodology over another.

Although bilingual education has been variously supported and vilified over the past thirty years, it is the quieter standards-based movement, exemplified by the NCLB and more recently by the Obama Administration's Race to the Top education legislation, which provides the most dangerous threat to bilingual education. With state departments of education and school districts in a literal "race" to get federal funds, many are willingly adopting significant testing requirements which are incompatible with the longer-term academic achievement that bilingual education promises. The courts for their part are not willing to extend education rights beyond very limited boundaries: there is no federal constitutional right to an education; and local control is paramount unless a conservative federal educational agenda is being advocated. The battle for educational excellence for language minority students continues to lie in very local, district-based, parent-controlled activism with focused litigation only when necessary.

Legal Interpreting

ERIK HERTOOG

A “legal interpreter” is a trained, qualified professional providing interpreting to those involved in whatever capacity—be it as defendant, refugee, victim, witness, etc.—in a legal system whose language they do not speak.

The term “legal interpreter/interpreting” is more inclusive than, for example, “court interpreter,” which applies to one specific setting only, or “sworn” interpreter, referring to a procedural qualification; on the other hand, the term is not as broad as “public service” or “community” interpreter, which also covers domains such as health or social services. Legal interpreting (LI) includes interpreting in all legal services settings, from police interviews and lawyer–client meetings, juvenile courts and local prisons, probation services and immigration hearings, to the International Criminal Tribunal for the former Yugoslavia (www.icty.org) or the European Court of Human Rights (www.echr.coe.int).

In all these settings the legal interpreter will need to master every mode and strategy of interpreting, such as short dialogue or “liaison” interpreting in, for example, a police interview or a cross-examination; consecutive—with note taking—for, say, an asylum seeker’s narrative or a vulnerable witness; simultaneous (usually whispered—“chuchotage”—though sometimes using portable sets or booths) during running renditions such as the closing arguments or sentencing in court. Legal interpreters are also required to master on-sight translation of all sorts of personal and official documents such as witness or expert testimony documents, and increasingly to do telephone or video-conferencing interpreting. In other words, it is not the modes or the strategies that set the legal interpreter apart from the conference interpreter but it is the settings, usually rigorous, institutional, and antagonistic. First, there often are “clients” whose rights or personal freedom are at stake in often complex and sensitive cases; second, working arrangements in LI are usually bidirectional (i.e., interpreting both in and out of the two languages used); third, the proxemics between the participant parties is completely different, the acoustics and positioning arrangements are often strenuous, and it is on the whole a solitary profession with a very different social aura, professionalization, and remuneration.

History

The “modern” concern for justice, including the right to due process and a fair trial and hence the right to an interpreter, became enshrined in international conventions such as the 1950 European Convention for the Protection of Human Rights and Fundamental Freedoms as well as in national legislation, for example, the 1978 US Federal Courts Interpreters Act (amended in 1988). Antidiscrimination legislation also contributed to the emerging provision of LI—leading to, for example, the establishment of the Registry of Interpreters for the Deaf in the USA in 1965 (www.rid.org)—as did the new (im-)migration needs, such as in Australia, where a Telephone Interpreter Service was set up in 1973 (www.immi.gov.au), or in Sweden, where as early as 1976 standards for LI were set. Many countries, from South Africa to the Netherlands, from Canada to Japan, have since then made serious efforts and taken major strides in providing quality LI in their legal services.

A more recent, interesting development is taking place in the European Union where, as a result of enlargement, all 27 member states of the EU now see an ever-growing movement of citizens who occasionally find themselves faced with legal problems in the foreign country. While enhancing judicial cooperation and mutual recognition between the member states, an accompanying process has been launched to safeguard procedural rights, which resulted in October 2010 in a legally binding directive on the right to interpretation and translation in criminal proceedings (<http://eur-lex.europa.eu>).

Role

LI is a particularly demanding form of interpreting, if only because of the conflicting perceptions of the role of the legal interpreter. In legal terms s/he is not an “expert” taking the stand, nor a witness who can be cross-examined or even questioned, for example, on issues of linguistic provenance let alone on the veracity of certain statements. S/he is a “*sui generis*” officer of the legal service employed and relied on for his or her specific expertise. That s/he is sometimes “sworn” in relates to the issue of accuracy expected from him or her: that is, the statements of the participant parties are to be rendered for the record “exactly” as meant and intended and in that sense, if s/he fails to comply with that overriding requirement s/he can indeed be liable to charges of perjury (Grabau & Gibbons, 1996; Roberts-Smith, 2009).

Moreover, the legal position becomes compounded because of conflicting perceptions and expectations of the role of the interpreter. On the one hand, there are the “clients” who obviously turn to the one person present who understands their language. They will inevitably try to speak to and through the interpreter who, if not careful, may be seduced into a role of facilitator or mediator, or even “advocate” of a disadvantaged party. And there are situations—for example, child abuse cases or asylum application hearings—where the pressure on the interpreter to take a “human,” supportive role is tremendous. On the other hand, many legal professionals still see the interpreter as some sort of mechanic “conduit,” a “pane of glass” through which the information flows unchanged from one language into another, an unobtrusive, invisible “cipher” (Schweda Nicholson, 1994). The underlying assumption is that language is a monolithic block, that languages are isomorphic and that for the sake of justice one has the right to expect (because the interpreted rendition becomes the official record) that the exchanges between the parties can and will be transferred “*verbatim*”—with absolute corresponding accuracy—into the other language. The interpreter is indeed required to transfer the full content, meaning, and intent, and tone, level, and form of a statement, including (and thus different from conference interpreting) hedges, hesitations, self-corrections, false starts and so forth, and to leave no omissions, make no additions, edit no slang or insults, elaborate no evasions or colloquialisms. However, this is a far cry from “*verbatim*” as expected by many legal professionals. “*Verbatim*” statements from one language into another in number and sequence, in meaning, style, and intent, are a nonsensical absurdity, of course. What the interpreter transfers is not a sequence of “words” but the full linguistic intent of units of meaning, thus arriving at linguistically equivalent and legally correct correspondences in the other language (Gonzalez, Vasquez, & Mikkelsen, 1992).

This necessary and inevitable decision making on the part of the interpreter is still often misunderstood and even inspires distrust among legal professionals as to the fundamental role of the interpreter. But the idea that “*verbatim*” equals accuracy and that neutrality equals invisibility has been replaced in consistent research and fieldwork by a role of the interpreter that goes beyond “mere” translation in the interaction. Any interpreter-mediated

event is now seen as actively constructed by all parties together and, moreover, operating within larger institutional constraints as well as within a cultural, “political,” and ideological framework which needs to be understood. Consequently, the interpreter as an active participant in the event has affected the current understanding of his or her complex role and has brought about a shift from earlier predominantly prescriptive, dogmatic codes of conduct to the necessity for qualified interpreters to possess a profound knowledge, great awareness, and full integration of their complex professional role. (See, for example, Wadensjö, 1998; Angelelli, 2004; and www.ncihc.org for a 2005 international comparison of codes; other examples at www.ausit.org, www.najit.org, or the code proposed in the EU Grotius I project at www.eulita.eu.) Any code will at least contain the following fundamental principles: legal interpreters must observe confidentiality and impartiality; disclose professional limitations or conflict of interest; only undertake assignments for which they are competent; always interpret to the best of their ability; decline any reward other than agreed fees and expenses; seek to increase their professional skills and safeguard professional standards.

Training

The conclusions from a survey on the provision of LI in the EU indicate that there are insufficient numbers of trained legal interpreters who meet, if at all, very different quality standards (Hertog & van Gucht, 2008). However, there is a genuine growing awareness these days—and this for a variety of reasons such as efficiency and quality of service, risk management and, of course, safeguarding fundamental rights—that training is the key issue to further development.

Consequently, there is now an interesting range of training programs, from ad hoc “professional” LI courses offered by academic institutions (e.g., in Sweden by www.tolk.su.se) or professional bodies (e.g., the Polish Association of Authorized Legal Translators and Interpreters, www.tepis.org.pl); to “broader” higher education curricula such as the BA “Fachdolmetschen” in Magdeburg (www.hs-magdeburg.de) or the MA in Public Service Interpreting (www.surrey.ac.uk), which both include medical and social interpreting, however; to specific LI programs as offered, for example, by Vancouver Community College (www.vcc.ca), the University of Charleston (www.cofc.edu), or the University of Western Sydney (www.uws.edu.au).

Whatever the format, they all aim to train the core competencies required of the legal interpreter (see the Reflection Forum Report at www.eulita.eu, the professional interpreting standards at www.cilt.org.uk, or the legal interpreting competencies required by the US National Center for State Courts, www.ncsc.org). These would include at least the following components: language proficiency including registers, terminology, legal discourse, and genres; knowledge of the legal system (structures, procedures, professionals, etc.); interpreting skills; the code of conduct and the guidelines to good practice; cultural awareness; interpersonal skills and attitudes; knowledge of professional issues (associations, assignment management, etc.)—all this integrated in practical observation visits, case studies, and role plays. After testing and assessment, a good training program leads to a certification procedure which is reliably accredited by a central authority, as is the case, for example, in the Federal Court Interpreter Certification Examination program in the USA (www.uscourts.gov), the Certified Court Interpreter procedure in four provinces of Canada (www.cttic.org), or the NAATI certification system in Australia (www.naati.com.au). “Training the trainers” courses and continuous professional development opportunities complement the picture.

Research

Susan Berk-Seligson's landmark study (1990) of English-Spanish interpreting in US courts launched a stream of discourse-oriented studies, taken further in Cecilia Wadensjö's study of police and asylum interpreted hearings (1998) and Sandra Hale's *The Discourse of Court Interpreting* (2004); and in sign language research, notably by Melanie Metzger (1999) and Cynthia Roy (2000). Rather than concentrating exclusively on the interpreter as a "translator" ("talk as text"), these exemplary studies show, first, how the interpreter is also actively involved in coordinating the participants' talk ("talk as activity")—the interpreter constantly choosing between representing or reenacting others' talk—and, second, how discourse analysis and pragmatics can shed light on the impact of linguistic strategies in LI. To what extent does turn taking and control of the flow of the speakers, or the interpreter's use of powerless speech markers (hesitations, fillers, hedges, backtracking, etc.), impact on the credibility of, say, the witness, or the convincingness of the interpreter? What are the consequences when the pragmatic force of question types is not understood by the interpreter, or when the level of coerciveness is fundamentally altered (Berk-Seligson, 1999; Hale, 1999)? This has been such a fruitful area of research, illuminating both legal language use and interpreting performance, that the "dialogic discourse-based interaction" paradigm seems to have firmly established itself as the current research paradigm in LI.

The study by Robert Barsky (1994) of interviews of applicants for refugee status in Canada, highlighting the structural and institutional environments in which such interpreting assignments take place, has opened up the path for critical discourse analysis which is currently being combined with, for instance, politeness theory and face-saving or face-threatening strategies. Critical discourse analysis, which underlies the interesting work of Mason (2005) and Pöllabauer (2005), focuses more on the political, social, and institutional structures and contexts of LI and highlights issues such as power, class, gender, and race.

Another area of research concerns nonlinguistic aspects, such as the perceptions and expectations of the role of the interpreter, which are conducted mainly via ethnographic research making use of questionnaires, surveys, in-depth interviews, and focus group discussions (Kadric, 2006). On the whole, most LI research is descriptive and qualitative and, unfortunately, often prone to quick generalizations as there is little opportunity for experimental and quantitative research. This makes it difficult, in the end, to assess in a truly valid way such things as the impact of LI performance strategies on the legal system and its decision-making processes or the efficacy of particular training programs.

And, of course, technology provides its own challenges and opportunities for research. As more courts follow the example of the international courts and turn to the use of portable sets or simultaneous interpreting booths for the proceedings, issues such as team interpreting or maintaining quality in simultaneous interpreting will become more important in the training of LI. The same goes for interpreting over the telephone, introduced in the 1970s in Australia and the 1980s in the USA, which has become more widely used recently, together with its modern counterpart, interpreted video conferencing. This is a result of more cases in far-off locations, the scarcity of specific language combinations, the urgency of the matter, security considerations (e.g., the transportation of inmates between prison and court), or, indeed, for cost-saving reasons, in order to cut down on travel and waiting time of the interpreters and speed up the flow of run-of-the-mill cases. However, more research is definitely needed on when and how to use remote or video interpreting and how this technology impacts on the interpreting performance and quality (www.videoconference-interpreting.net). A final example concerns the greatly increased use of telephone tapping, where it is obvious that a combination of highly advanced oral and written language skills is needed to arrive at reliable forensic transcripts and translations.

LI research thus takes its inspiration from "translatology" theories as well as many other

disciplines such as conversation and discourse analysis, pragmatics, forensic linguistics, ethnographic and cultural studies, but also from legal and social studies. The diversity of methodologies and research strategies and interdisciplinarity are now the bread and butter of LI research and as a result immense gains have been made in our understanding of the theory and practice of LI (Hertog & van der Veer, 2006).

All leading academic journals in interpreting now pay explicit attention to LI (e.g., *Meta*, *Journal of Interpretation*, *Target*, *Interpreting*, *The Translator*, etc.) and many other major linguistics journals such as *Forensic Linguistics* (see for example issue 6, 1), *Applied Linguistics*, or the *Journal of Pragmatics* publish articles and devote special issues to various aspects of LI. Listservs such as the ones monitored by Ausit (www.ausit.org), Najit (www.najit.org), by professor Ruth Morris of Bar-Ilan University, or *Forensic Linguistics* (www.jiscmail.ac.uk/forensic-linguistics) provide another platform for the exchange of information. Both academia and professional associations organize conferences on LI such as the Critical Link conferences (www.criticallink.org), which have greatly contributed to the dissemination of LI research among trainers and practitioners.

Consequently, LI has firmly established itself as a major research area in “Interpreting Studies,” one with great contributory power to the discipline as a whole. Moreover, LI research is firmly embedded in the institutional and socioenvironmental contexts of the interpreting events, focused as it is on the study and delivery of the quality of LI to individual clients, legal professionals, and the institutional systems as a whole, thus making it also a highly relevant academic discipline.

Professionalization

In spite of its institutional and human importance, LI remains a complex, sometimes controversial field in many countries, with fluctuating linguistic needs, highly vulnerable to budget pressures and a volatile political climate. There is therefore a need for strong professional LI associations to play a prominent role with regard to at least the following crucial issues.

First, there is the issue of continuous professional development (CPD). The domain of the law and the practices and procedures of the legal services are constantly changing. Therefore, CPD activities on new resources of information, new technologies, on advanced language proficiency, on demanding specializations—whether human trafficking, child abuse, terrorism, telephone tapping, or cross-border video conferencing, and so forth—will all contribute to the improvement of LI practice. Professional LI associations are eminently placed to meet this need.

Second, a profession could be defined as a group of people who not only share a common expertise but also “profess” to a code of ethics (or “conduct”) and to guidelines of good practice. Professions come into being where trust is required, primarily because the clients are not in a position to judge for themselves the quality of service being given. Clients, whether defendants or prosecutors, cannot judge for themselves the quality of the work of the legal interpreter because they do not speak either of the languages in question. In order to fulfill what is required of them, professions therefore not only set levels of expertise but also perform their assignments in accordance with a professionally established code of conduct. This is in the public interest as well as in the interest of their clients, colleagues, and themselves. After all, an unqualified interpreter puts all parties involved at risk, which could result in a wrongful conviction or an acquittal. Establishing such a code, including its procedural disciplinary measures, is obviously the remit of professional associations (Corsellis, 2008).

Third, the legal process is multidisciplinary and each professional has to know and respect the other’s role. Consequently it is important that the judiciary, the police, and

other legal professionals know or learn how to work with legal interpreters. They should be offered training on working with legal interpreters, so that they are able to recognize when an interpreter is needed, to select and use only qualified interpreters from an approved register, to brief the interpreter and provide him or her with the necessary information to be able to do a good job, to recognize and respect the interpreter's role and code of conduct, to accommodate the necessary interpreting modes (e.g., consecutive or whispered simultaneous), and to take all necessary measures to protect them against invasion of their privacy and provide access to qualified assistance when needed. Such informed awareness among legal professionals will greatly enhance the efficiency of the interpreter-mediated proceedings or encounters.

One cannot therefore underestimate the role of professional associations, be they national, such as the National Association of Judiciary Interpreters and Translators in the USA, or international, such as EULITA, the European Legal Interpreters and Translators Association, which aims amongst other things to support associations of legal interpreters and translators, promote training and research, encourage the recognition of their professional status, and promote cooperation and exchange of best practices in working arrangements with the legal professionals. The growing concern in the legal services with fundamental and human rights issues, with risk management and efficient, cost-effective delivery of service on the one hand, and the bottom-up pressure from professional associations and qualified practitioners on the other, is convincing more and more institutional providers to identify their needs in LI, set the targets, and chart the incremental steps and the timescales to safeguard access to justice across languages and cultures.

Legal Language

STANISŁAW GOŹDŹ-ROSZKOWSKI

What Is Legal Language?

It is generally acknowledged that law does not exist without language. Legal rules and regulations are coded in language. Legal concepts and legal processes are accessible only through language. If a legal text is criticized for being abstruse and incomprehensible to the general public, the problem most probably lies with the language. The designation “legal language” tends to emphasize the subject matter, the domain in which language is used, that is, law. It might therefore create the spurious impression of legal language being a homogeneous and uniform phenomenon. In fact, the expression “legal language” hides a multitude of specific classes of texts (genres) created and used by various professional groups working in different legal contexts. Legal language spans a continuum from legislation enacted at different levels (e.g., state, federal), judicial decisions (judgments, decrees, or orders), law reports, briefs, various contractual instruments (wills, power of attorney, etc.), academic writing (e.g., journals, textbooks), through oral genres such as, for example, witness examination, jury summation, judge’s summing-up, and so forth, to various statements on law reproduced in the media and any fictional representation of the foregoing. Thus, what is routinely referred to as “legal language” represents an extremely complex type of discourse embedded in the highly varied institutional space of different legal systems and cultures. In other words, the designation “legal language” should be viewed as an umbrella term referring to a universe of remarkably diverse texts, both written and spoken. While legal language has always been an interdisciplinary object of research attracting both lawyers and linguists, the focus of this entry is on language-based approaches and methodologies (see Tiersma, 2008, for a useful overview of both legal and linguistic approaches to legal language).

The complexity of legal language can be attributed to its long historical development, which often ran parallel and independently of ordinary language. Legal English was greatly influenced by Anglo-Saxon, Latin, and French. Interested readers should consult Mellinkoff (1963) for one of the most detailed descriptions of legal English including its history (see also Hiltunen, 1990; Tiersma, 1999). The oldest recorded evidence of legal translation is the Egyptian–Hittite peace treaty of 1271 BC (Šarčević, 1997), while, for example, Bible translation dates back to the third century BC. Significantly, the forms and meanings of legal language developed through legal rather than linguistic processes. The meaning of legal terms, phrases, or even longer chunks of discourse is determined by courts, legislatures, and government agencies and consequently it often differs from ordinary usage. Such influence of jurisdiction on the development of legal discourse has often led to problems connected with its interpretation and comprehensibility.

The perception of legal language as opaque and incomprehensible, especially in the case of government forms and consumer documents, resulted in the emergence of the Plain English Movement (see the classic book by Wydick, 1994). This movement is directed at making the law more understandable to the general public, especially in the case of the so-called consumer documents, such as contracts, leases, notices, and so forth.

The appropriateness of using the designation "legal language" has been the subject of much debate. Klinck (1992) contains a detailed discussion of various perspectives adopted with respect to this issue. Essentially, the opinions range from those who maintain that "there is such an identifiable phenomenon as 'legal language' and that it is meaningful to think in terms of such a category" (Klinck, 1992, p. 133) and use the designation "law language" with reference to a "technical, idiosyncratic sublanguage system," to those like George Mounin (1974) who assert that it is not scientifically correct to speak of the language of law because legal language is only a specialized form of general language rather than an autonomous and independent linguistic phenomenon. Charrow (1982, p. 84) notes that the designation "legal language" spans a continuum "from almost 'normal' formal usage to highly complex varieties that differ substantially from normal formal usage."

No clear consensus exists on which classificatory term should be used. For example, Brenda Danet (1980) considers *dialect*, *diglossia*, and *register* as labels potentially applicable. The concept of dialect has not been generally accepted (e.g., Charrow, 1982, p. 82) because legal English does not tend to meet the basic intelligibility criterion whereby two varieties can be called dialects if they are mutually intelligible. It is by no means certain that legal language is intelligible to ordinary speakers of language. More importantly, dialects usually differ greatly in terms of vocabulary, syntax, and so on, and they are traditionally associated with geography. By contrast, legal language frequently mimics ordinary language considerably and it is not linked to any specific geographical location. Although diglossia has never been taken entirely seriously as a concept applicable to the study of legal language, it is worth recalling because it usefully highlights some important features of legal language. Diglossia is typically associated with bilingualism and it refers to two language varieties coexisting in society. It assumes that one low variety is used more frequently in informal, personal situations while the high variety tends to be employed in formal and official communication contexts. The high variety is perceived as more prestigious and superior to the low variety, which is used largely to deal with interpersonal and domestic issues. Viewed in such terms, legal language could be described as the high variety (H) with general language relegated to the status of a low variety (L). Danet lists several features of diglossia which seem relevant, even if somewhat controversial, to describe the relationship between legal language and general, ordinary language. These could be summarized as including the specialization of function for the high and low varieties; the perception of H as prestigious and superior to L; the fact that H is acquired through formal education; the fact of a simpler grammatical structure for L than for H; and finally, the acceptance that H is not regularly used as a medium of ordinary conversation by any segment of a speech community.

Other concepts often attributed to legal language include *jargon*, *argot*, *style*, and *sub-language* (see Tiersma, 1999, pp. 141–3). They have not gained wide currency because they tend to be too restrictive to capture the complexities of legal language. The term "jargon" refers primarily to vocabulary, while legal language cannot be characterized solely in lexical terms. Similarly, "argot" can also be used with reference to an informal highly specialized vocabulary from a particular field but it is traditionally associated with secret language employed by various groups, usually linked to illicit activity, to stop outsiders from understanding their communication. It is thus a term with strong negative connotations and hardly appropriate to describe the language of legal communication. The notion of style has also been used in reference to legal English (e.g., Crystal & Davy, 1969). While it is felt that there seems to be a distinct legal style, the concept lacks a sufficiently precise definition to warrant a rigorous and systematic study of legal language. Finally, some scholars (Charrow, Crandall, & Charrow, 1982) suggest that legal language could be studied as a sublanguage, a concept associated with a computational approach to language analysis. It is argued that legal language shares most of the features attributed to sublanguages,

such as limited subject matter; the presence of lexical, syntactic, and semantic restrictions; the occurrence of nonstandard, grammatical rules; and unusually frequent occurrence of certain constructions in comparison with general language such as, for example, nominalization, the modal *shall*, passive forms, and so forth.

It seems that the term “legal language” has been all too often used as a convenient label for a generalized functional variety, or register, of modern English. Unfortunately, such labeling often implied that it was either stationary or homogeneous, ignoring a great degree of variability of legal language and its constant evolution. More recently, some scholars have questioned the relevance of using such general, umbrella terms, suggesting that the complexity and *intertextuality* within legal language should be ideally viewed in terms of domain-specific *disciplinary genres* (Bhatia, 2004; Goźdz-Roszkowski, 2011). Thus, the designation “legal language” in fact seems to refer to the universe of particular systems of genres connected with different professional activities and combined with large primary genres such as legislation or judgments. In the course of professional activity, its participants need to refer to, interpret, and exploit such larger generic constructs in order to achieve their professional objectives. Taken together, all such genres combined form a set of domain-specific disciplinary genres. These can be found in different configurations depending on the nature of a particular professional activity and the extent to which other genres are referred to or relied upon.

Variation in Legal Language

Legal language shows enormous variation in many different respects. The system of common law originating in Great Britain has spread to many other countries around the world, notably to the United States, Canada, Australia, New Zealand, South Africa, and to India and other countries where English was recognized as one of the official languages. Despite sharing certain basic characteristics, the language and legal institutions in the respective countries have come to differ markedly from one another (Williams, 2005). Legal language also differs in terms of the level of formality, mode (spoken or written), and the use of individual genres by different professional groups (e.g., judges, attorneys, paralegals).

This perception of legal language has led to the emergence of different taxonomies and typologies. For example, Danet (1980, p. 471) proposes a well-known classification based on stylistic categories for degree of formality related to different modes of text production. Thus, in terms of mode, Danet distinguishes between written and oral texts, with the latter subdivided into spoken-composed and spoken-spontaneous. The degree of formality is marked by means of four distinct categories (frozen, formal, consultative, and casual). Various legal genres can be thus distinguished and compared according to this set of contextual factors. This important sociolinguistic scheme suggests that legal genres vary depending on the degree of codification, standardization, and predictability of lexicogrammatical structures. For example, genres such as insurance policies, contracts, leases, and wills are subsumed under the “frozen” and “written” categories, reserved for texts with highly formal traits and with features typical of the written mode. According to Danet’s scheme, other written genres such as statutes, briefs, and appellate opinions exhibit a lower degree of formality in comparison with that of witness examinations and motions, which belong to the oral mode (Danet, 1980, p. 471). After conceding that legal discourse is expressed in various legal situations, Maley (1994, p. 13) lists several categories such as judicial discourse, courtroom discourse, the language of legal documents (contracts, regulations, deeds, wills, statutes), and the discourse of legal consultation. Maley (1994, p. 16) also provides a classification of legal discourse reflecting the consecutive stages of a “conflict resolution scheme.” Another well-known distinction proposed by Trosborg

(1995, p. 32) concerns “language as realized specifically in legal documents, i.e. texts covered by the scope of statute law and common law, namely (i) legislation, and (ii) simple contracts and deed,” referred to as “the language of the law,” which should be distinguished from other uses of “legal language.” Tiersma (1999) provides a tripartite division of legal texts into three major categories: *operative* legal documents (those that create or modify legal relations such as petitions, statutes, contracts, wills, etc.); *expository* documents (e.g., judicial opinions which analyze objectively legal points); and *persuasive* documents (e.g., briefs or memoranda). More recently, Gibbons (2003, p. 15) reiterates some fundamental and classic distinctions of legal language. One basic dividing line runs along the written versus spoken mode. Thus, there are written, largely monologic texts of legislation and other legal documents, and the spoken, more interactive and dynamic texts found in a variety of law-related processes, such as, for example, courtroom interaction, police investigations, prisons, and consultations between lawyers and clients.

Register and Genre Perspectives on Legal Language

Despite the absence of a general consensus concerning the use of register, genre, and other related terms such as style, previous linguistic investigations of legal language have relied heavily on the concepts of *register* and *genre* in the construction of their analytical frameworks. Thus, by and large, the term “register” has been used to refer to a general variety of language associated with a domain of use, that is, law. In contrast, the term “genre” has been understood as referring to more specialized varieties within legal register, such as, for example, brief, statute, contract, judgment, textbook, or academic essay.

Even though legal language has been recognized as indeed heterogeneous, there have been very few comprehensive and empirically grounded studies of variation in legal language. Most linguistically oriented studies have either treated legal language as a largely monolithic phenomenon or studied legal language by focusing on a single textual category and a limited range of linguistic features. The former approach has been defined largely in terms of several distinctive lexicogrammatical features—such as, for example, the excessive use of the passive voice, conditionals, archaic adverbs and prepositional phrases, the frequent use of conditionals, the modal *shall*, multiple negation, and so on, which should apparently hold true for all types and categories of legal texts (see Mellinkoff, 1963). Legal language has been considered as a specialized discourse, marked by features such as precision, indeterminacy, specialization, complexity, and conservatism. Recent advances in corpus-based, genre-oriented research have provided a more accurate description of the overall characteristics of legal language, demonstrating that the frequency and distribution of such features varies depending on a particular legal genre (see Williams, 2005; Goźdz-Roszkowski, 2011).

The latter approach has been going through various stages of development. Early research on the language and law interface goes back to the 1960s and 1970s (e.g., Crystal & Davy, 1969; Gustafsson, 1975; Spencer, 1975) and it focuses on statistically significant features of lexicogrammar used in a particular type of legal texts. For example, Gustafsson (1975) focused on binomials and multinomials in legal discourse; Spencer (1975) investigated noun-verb combinations as yet another characteristic feature of legal discourse. Such analyses belong to the early studies of language variation as “register.” This trend continued in the 1980s and it was marked by efforts directed at the surface-level features of language combined with the description of functional variation in discourse. For example, Finegan (1982) looked at form and function in testament language; Bhatia and Swales (1983) examined nominalizations in legislative discourse; and, more recently, Williams (2005) focused on verbal constructions used in prescriptive legal texts. In the absence of

advanced computational and corpus procedures, they were severely limited to only a few significant features. In addition, there was very little attention paid to any significant comparisons of different legal genres. It was simply not feasible to provide a comprehensive description of register variation by considering the full range of texts and linguistic characteristics. It was only with the advent of corpora and computational analytical tools that such analyses have become possible.

Thanks to the emergence of genre theory for the analysis of written discourse, the analyses of legal language gradually shifted from the textualization of lexicogrammar toward the investigation of its conventional and institutional discourse, carried out from the perspective of legal institutional and disciplinary practices, procedures, and culture. The extended analytical framework was needed to gain a better idea of how members of the legal profession employ generic and discoursal strategies to achieve their communication goals (see, for example Bhatia, 1993). While genre-oriented research continues to deal with professional and disciplinary aspects of legal discourse, some discourse studies have broadened the scope of analysis by investigating how legal language is used as a powerful instrument of social control. This research trend can be illustrated by the now extensive area of social scientific studies of the courtroom discourse. At the core of these studies is the relationship between factual evidence and the subjective judgments of the witnesses placed in the institutional context of the courtroom (e.g., Berk-Seligson, 2002; Heffer, 2005).

Other Language-Based Approaches to Legal Language

The last three decades have seen an explosion of interest in studying the relationship between language and the law. The complexity of this area is reflected in the multitude of perspectives from which research has been carried out. These range from the already-mentioned genre and discourse analysis (Stygall, 2002), to rhetorics (Goodrich, 1987), semiotics (Kevelson, 1982, 1989; Jackson, 1994), speech act theory (Kurzon, 1986), modality and forensic linguistics (Berk-Seligson, 2002; Gibbons, 2003). The rapidly growing interest in the converging fields of law and linguistics has prompted some scholars to postulate the emergence of a new interdisciplinary field of legal linguistics (see French *jurilinguistique* or German *Rechtslinguistik*), covering a range of different, albeit related, areas such as legal terminology and lexicography, legal translation (Šarčević, 1997) and interpreting (Berk-Seligson, 2002), courtroom discourse (Heffer, 2005), linguistic human rights, language policy and planning, and so forth. As a result of the internationalization of legal and linguistic practices, a multicultural and multilingual approach has emerged which examines the use of legal English in non-Anglophone countries and in supranational legislation. Increasing legal globalization has sparked off investigations into legal concepts across different legal systems and legal cultures (see Bhatia, Candlin, & Engberg, 2008). While legal English is the focus of this entry, it should be noted that there is an extensive body of literature on other legal languages and legal systems (see Didier, 1990, for a comparative description of the common law and the civil law systems and the corresponding English and French legal languages; Kniffka, 2007, for a German perspective on legal language).

The relationship between law as a specialist language and general, ordinary language continues to be an important topic, especially in relation to European integration. Legal language has been recognized as one of the cornerstones of the harmonization and unification process of the law in Europe.

Legal Translation

DEBORAH CAO

Legal translation is a complex and special type of linguistic activity. It involves mediation between different languages and cultures, and above all different legal systems. It requires special skills, knowledge, and experience on the part of the translator. This entry outlines the key concepts and issues involved in legal translation.

Legal Translation Defined

Legal translation is a type of specialist or technical translation, a translational activity that involves special language use—that is language for special purposes (LSP) in the context of law, or language for legal purposes (LLP).

For our purpose, legal language refers to the language of the law and language related to law and legal process, including language used in various legal communicative situations. Legal translation refers to the rendering of legal texts from the source language (SL) into the target language (TL).

Legal translation can be classified according to different criteria. For instance, legal translation has been categorized according to the subject matter of the SL texts into the following categories: (a) translating domestic statutes and international treaties; (b) translating private legal documents; (c) translating legal scholarly works; and (d) translating case law. Legal translation can also be categorized according to the status of the SL texts: (a) translating enforceable law, e.g., statutes; and (b) translating nonenforceable law, e.g., legal scholarly works. Furthermore, legal translation may be classified according to the functions of legal texts in the SL: (a) primarily prescriptive, e.g., laws, regulations, codes, contracts, treaties, and conventions; (b) primarily descriptive and also prescriptive, e.g., judicial decisions and legal instruments that are used to carry out judicial and administrative proceedings such as actions, pleadings, briefs, appeals, requests, petitions, etc.; and (c) purely descriptive, e.g., academic works written by legal scholars, for example legal opinions, law textbooks, and articles, the authority of which varies in different legal systems (Sarcevic, 1997, p. 11).

These aforementioned classifications have their limitations as they do not include certain types of texts such as court documents. In view of this, legal translation can be better classified in light of the purposes of the TL texts (see Cao, 2007): (a) normative purpose, i.e., the production of equally authentic legal texts in bilingual and multilingual jurisdictions of domestic laws and international legal instruments and other laws; (b) informative purpose, e.g., the translation of statutes, court decisions, scholarly works and other types of legal documents where the purpose of the translation is to provide information to the target readers; and (c) general legal or judicial purpose, e.g., documents used in court proceedings, including statements of claims or pleadings, summons, contracts and agreements, and ordinary texts such as business or personal correspondence, records, certificates, witness statements, and expert reports, among others.

In short, legal translation is used as a general term to cover both the translation of law and other communications in legal settings.

Sources of Difficulty in Legal Translation

It is often said that legal translation is difficult and complex, but why? There are a number of reasons. In essence, the nature of law and legal language contributes to the complexity and difficulty of legal translation. This is compounded by further complications arising from working with two languages and legal systems in translation. Sources of difficulty with legal translation include the systemic differences in law, linguistic differences and cultural differences. All of these are closely related.

Different Legal Systems and Laws

Legal language is a technical language, but, unlike the language used in pure science (such as mathematics or physics), legal language is not a universal technical language. Rather, it is tied to a national legal system (Weisflog, 1987, p. 203). Legal language is system-bound—that is, it reflects the history, evolution, culture and above all the law of a specific legal system.

Law as an abstract concept is universal, as it is reflected in written laws and customary norms of conduct in different countries. However, legal systems are peculiar to the societies in which they have been formulated. Each society has different cultural, social and linguistic structures, which have developed separately. Legal concepts, legal norms and application of laws differ in each individual society, reflecting the differences in that society. Legal translation involves translation from one legal system into another. Unlike pure science, law remains a national phenomenon. Each national law constitutes an independent legal system with its own terminological apparatus, underlying conceptual structure, rules of classification, sources of law, methodological approaches and socioeconomic principles (Sarcevic, 1997, p. 13). This has implications for legal translation when communication is channeled across different languages, cultures, and legal systems.

First, law is culturally and jurisdictionally specific. According to David and Brierley's classification, world legal systems or families can be categorized as Romano-Germanic Law (Continental Civil Law), Common Law, Socialist Law, Hindu Law, Islamic Law, African Law, and Far East Law (David & Brierley, 1985, pp. 20–31). On the other hand, according to Zweigert and Kötz (1992), there are eight major groups: Romanistic Law, Germanic Law, Nordic Law, Common Law, Socialist Law, Far Eastern Law, Islamic Law, and Hindu Law. The two most influential legal families in the world are the Common Law and the Civil Law (Romano-Germanic) families. As David and Brierley (1985, p. 19) state, each legal system or family has its own characteristics: "a vocabulary [is] used to express concepts, its rules are arranged into categories, it has techniques for expressing rules and interpreting them, it is linked to a view of the social order itself which determines the way in which the law is applied and shapes the very function of law in that society." Due to the differences in historical and cultural development, the elements of the source legal system cannot be simply transposed into the target legal system (Sarcevic, 1997, p. 13). Thus, the main challenge to the legal translator is the incongruency of legal systems in the SL and TL.

Linguistic Differences

Linguistic difficulties in translation often arise from the differences found in the different legal cultures and legal systems—for instance, the Common Law as contrasted to the Civil Law which will be used here for illustrative purposes. The root of the problem lies in their varying legal histories, cultures, and systems. Legal language has developed its characteristics to meet the demands of the legal system in which it is expressed. As mentioned, legal translation is distinguished from other types of technical translation

that convey universal information. In this sense, legal translation is *sui generis*. Each legal language is the product of a special history and culture. It follows, for example, that the characteristics of the *la langue de droit* in French do not necessarily apply to legal English. Nor do characteristics of the English language of the law necessarily apply to French.

A basic linguistic difficulty in legal translation is the absence of equivalent terminology across different languages. This requires constant comparison between the legal systems of the SL and TL. As argued, the absence of an exact correspondence between legal concepts and categories in different legal systems is one of the greatest difficulties encountered in comparative legal analysis (David & Brierley, 1985, p. 16).

In terms of legal style, legal language is a highly specialized language, which has its own style. The languages of the Common Law and Civil Law systems are fundamentally different in style. Legal traditions and legal culture have had a lasting impact on the way law is written. Written legal language thus reflects the essential elements of a legal culture and confronts the legal translator with its multifaceted implications (Smith, 1995, pp. 190–1).

In terms of the style of legislative drafting, Civil Law codes and statutes are concise (*le style français*), while Common Law statutes are precise (*le style anglais*) (Tetley, 2000, p. 703). Civil Law statutes generally provide no definitions, and they state principles in broad, general phrases. In contrast, Common Law statutes provide detailed definitions and each specific rule sets out lengthy enumerations of specific applications or exceptions, preceded by a catch-all phrase and followed by qualifications (Tetley, 2000, p. 703).

When we translate legal texts between different legal systems and languages, the degree of difficulty may vary. According to de Groot (1988, pp. 409–10), the following scenarios can be used to classify the affinity of legal systems and languages: (a) when the two legal systems and the languages concerned are closely related, e.g., between Spain and France, or between Denmark and Norway, the task of translation is relatively easy; (b) when the legal systems are closely related, but the languages are not, this will not raise extreme difficulties, e.g., translating between Dutch laws in the Netherlands and French laws; (c) when the legal systems are different but the languages are related, the difficulty is still considerable, and the main difficulty lies in *faux amis*, e.g., translating German legal texts into Dutch, and vice versa; and (d) when the two legal systems and languages are unrelated, the difficulty increases considerably, e.g., translating the Common Law in English into Chinese. In short, the degree of difficulty of legal translation is related to the degree of affinity between the legal systems and languages in question (de Groot, 1988, p. 410). An a priori argument of the disparity in legal systems is that variations exist in the different legal languages of individual societies using language to communicate law (Weisflog, 1987). The “system gap” (Weisflog, 1987) between one national legal system and another results in linguistic differences. Generally speaking, the wider the “system gap,” the wider the legal language gap.

In summary, the differences in the various legal systems and the consequent differences in the language used in law in the source and target systems have an impact on legal translation. The diverse range of linguistic differences is one of the most challenging aspects that confront the legal translator, irrespective of which legal language is involved. It is a major source of difficulty in legal translation.

Cultural Differences

Another source of difficulty in legal translation is cultural difference. Language and culture or social contexts are closely integrated and interdependent. A legal culture means those “historically conditioned attitudes about the nature of law and about the proper structure and operation of a legal system that are at large in the society” (Merryman, Clark, & Haley, 1994, p. 51). Law is an expression of the culture, and it is expressed through legal language. As pointed out, “[e]ach country has its own legal language representing the social reality

of its specific legal order" (Sarcevic, 1985, p. 127). A legal translator must overcome cultural barriers between the SL and TL societies when reproducing a TL version of a law originally written for the SL reader. Weston (1983, p. 207) writes that the most important general characteristic of any legal translation is that an unusually large proportion of the text is culture-specific. The existence of different legal cultures and traditions is a major reason why legal languages are different from one another, and will remain so.

Translating Different Types of Legal Texts

Legal translation involves different legal text types. The common legal text types include private legal documents, domestic legislation and international legal instruments. Each of these types of texts has its own linguistic and legal features, and there are also established conventions or practices for such translation that the legal translator needs to be familiar with (see Cao, 2007, 2010). Briefly, private legal documents mainly refer to contracts, agreements, wills and other legal documents. The translation of these documents constitutes the bulk of actual work in real life for many legal translation practitioners. Furthermore, bilingual or monolingual jurisdictions may need to translate their domestic legislation into another language, for example in Canada or the US. Lastly, there is the translation of international legal instruments, for instance at the UN and the EU. There are both legal and linguistic issues involved for these types of translation (see Cao, 2007, 2010).

Legal Translation: Possibility and Impossibility

Given the complexity and difficulty of legal translation, one may wonder whether law is actually translatable and whether true equivalence can be achieved in legal translation. It has been claimed that legal concepts which are alien or nonexistent in the target system are untranslatable.

We can look at the issue of translatability of legal texts from several perspectives. First, it is a fact that we translate law between different legal families and legal traditions, and we have been doing so for the last few centuries. In reality, the laws and legal systems in many countries and continents have been developed on the basis of legal transplant from other legal systems (see Watson, 1974) assisted to a large extent by the process of translation. Legal concepts, practices, and entire systems have been introduced to new political, social, cultural, and legal environments this way. Real-life experience, and successful experience at that, tells us that translating law, irrespective of the systems and families involved, is not only possible but also highly productive. However, this does not mean that there are no problems or that the job is easy.

Second, in terms of translational equivalence, when foreign laws, legal concepts, and practices are translated into a TL which does not have preexisting equivalents, naturally there needs to be a link that establishes a degree of relevant equivalence between the SL and TL for translation to take place. According to Toury (1986, p. 1123), equivalence is a combination of, or compromise between, the two basic types of constraints which draw from the incompatible poles of the target system and the source text and system. It can be argued that, conceptually and pragmatically, translation (including the legal kind) is not solely a matter of crossing languages or simply a question of identity or synonymy, because the validity of a translation is independent of whether an element in one code is synonymous with a correlated element in another code (Frawley, 1984, p. 161). Thus, translating legal texts is a relative affair. It is futile to search for absolute equivalence when translating legal concepts.

Third, the issue of comprehending translated law, after the initial linguistic transfer, is a related consideration. In people's understanding of translated texts originally written for

different audiences in different languages, inevitably sometimes there are confusions and misunderstandings. Such confusion may have something to do with the often invisible crossover in translation. Words may be written and read in the same language but people's interpretations in the SL and TL differ due to the differences in language use. Others' horizons that were encoded in the original language but are now represented in the translated language may not be so readily obvious (Gadamer, 1975), simply because the other horizons are now expressed in a deceptively familiar language—one's own language. Nevertheless, the "fusion of horizons" (using Gadamer's expression) is possible in translation and understanding translated texts.

In translation, including legal translation, one may say that a "fusion of horizons" can be achieved and mediated in the transmission of meaning, creating new interpretive horizons on the part of the reader of a translation. Despite the seemingly insurmountable conceptual and linguistic gulf, alleged and real, between different laws and languages, translating law is possible, and cross-cultural understanding in law can be realized, although such understanding is always subjective and may not be identical in all languages at all times. However, one may say that no exact equivalence or complete identity of understanding can be expected or is really necessary.

Lehiste, Ilse

ZITA MCROBBIE-UTASI

Ilse Lehiste (1922–2010) was professor emeritus in the Department of Linguistics at The Ohio State University. Her wide-ranging scholarly legacy has greatly influenced the way linguists view the science of phonetics and its role in the study of speech communication. Her pioneering research in employing and advancing experimental phonetic methods together with groundbreaking theoretical works on the acoustic properties of speech is a major contribution to the discipline of linguistics.

Ilse Lehiste was born in Tallinn, Estonia. She received a Doctor of Philosophy degree from the University of Hamburg, Germany, in 1949; subsequently she moved to the United States where she earned her PhD in linguistics from the University of Michigan in 1959. Prior to her appointment at The Ohio State University in 1963 she taught at the Kansas Wesleyan University (1950–1) and at the Detroit Institute of Technology (1951–6), and was a research associate at the University of Michigan's prestigious Communication Sciences Laboratory (1958–63). She was chair of the Department of Linguistics at The Ohio State University (1965–71; 1985–7) and director of the Linguistic Institute at The Ohio State University (1970). Dr. Lehiste taught as visiting professor at the University of Cologne, Germany (1965), the University of California in Los Angeles (1966), the University of Vienna, Austria (1974), the University of Tartu, Estonia (1993, 1995, 2006), and the University of Graz, Austria (2004).

Lehiste's remarkable scholarly output is evidenced by a large number of publications in the areas of acoustic phonetics, prosody (suprasegmentals), phonetics and phonology, language contact, and language change. She is author, coauthor, or editor of 20 books (author of nine, coauthor of eight books, first author of six books) and editor or, coeditor of three more. She has 203 published articles and her list of publications also contains 104 reviews.

Lehiste is regarded as one of the foremost authorities in acoustic phonetics. Her acoustic studies have been considered important and extensively referred to by scholars in phonetics and phonology. Among them are the books *Acoustic Characteristics of Selected English Consonants* (Lehiste, 1964) and *Some Acoustic Characteristics of Dysarthric Speech* (Lehiste, 1965). She was the editor of the volume *Readings in Acoustic Phonetics* (Lehiste, 1967), a basic handbook that has been widely used.

Lehiste's classic monograph *Suprasegmentals* (1970) provides a thorough investigation of all prosodic phenomena present in languages. The detailed discussions are appropriately illustrated with numerous crosslinguistic examples. In addition to describing the acoustic characteristics of suprasegmental features—quantity, tonal features, stress—she identifies patterns relevant to their function in the phonology of the language rendering this experimental study on suprasegmentals an important contribution to linguistic theory.

Lehiste's research has influenced theoretical phonetics in several important areas. Her studies on boundary phenomena have resulted in findings utilized by phoneticians examining the prosodic structure of larger linguistic units such as paragraphs and sentences. Lehiste's experiments, designed to discover the relationship between the suprasegmental structure of these units and the phonetic factors relevant to the signaling of boundaries have advanced research on the understanding of such boundary phenomena as preboundary

lengthening, presence of laryngealization, and length of pause (Lehiste, 1979). She has also studied the effects of morphological and syntactic boundaries relating to the temporal structure of utterances. One of her most significant theoretical studies investigates the much debated concept of isochrony. In a paper "Isochrony Reconsidered" she argues for the existence of isochrony—the organizing of utterances by speakers into more or less equal rhythmic units—as a perceptual phenomenon. The article also provides evidence for the integration of isochrony into the grammar at the level of syntax (Lehiste, 1977).

Lehiste's substantial research aimed at clarifying the complex issues associated with Estonian phonology has significantly contributed to the understanding of the production and perception of linguistic quantity. According to her analysis, quantity alternations can only be described by referring to units larger than the segment: that is, segmental quantity must be described by considering the syllable it occurs in and its position within the word. In addition to the importance of acknowledging the hierarchy of the prosodic levels—segment, syllable, disyllabic foot, and word—in exploring the acoustic properties of quantity her experimental phonetic research has identified the relevance of (a) durational ratios and (b) the presence of another prosodic factor—such as, fundamental frequency—in the realization of distinctive quantity (Lehiste, 1997).

Lehiste's research on the relationship between the prosody of a language and the metrical structure of poetry was based on the hypothesis stated in Lehiste (1985): "the essence of the suprasegmental structure of a language is crystallized in the meter of its traditional poetry." (p. 145) Results of the production and perception studies relating to prosody in language and poetry have been disseminated in several influential studies such as "The Phonetics of Metrics" (Lehiste, 1992), and "Contemporary Finnish and Estonian Realizations of Folksongs in the Kalevala Metre" (Lehiste, 2001). Many of her articles and a book *The Temporal Structure of Estonian Runic Songs: A Study of the Relationship Between Language and Music* (Ross & Lehiste, 2001) represent her research examining the ways in which sung poetry accommodates phonetic constraints in the language.

Lehiste's long-time collaboration with Pavle Ivić, the distinguished scholar of South Slavic, a dialectologist and a phonologist, has significantly contributed to research on Serbo-Croatian accentology. Their findings were published in a number of articles and in two books: *Accent in Serbo-Croatian: An Experimental Study* (Lehiste and Ivić, 1963) and *Word and Sentence Prosody in Serbocroatian* (Lehiste and Ivić, 1986).

In 1979 a coauthored book based on her teaching of historical linguistic courses was published: *Principles and Methods for Historical Linguistics* (Jeffers & Lehiste, 1979). The book presents a thorough discussion of up-to-date methodology for comparative and internal reconstructions; further, the authors present a meticulous survey of language change in all areas of grammar, including a chapter on the effect of language contact on language change.

Lehiste's interest in language contact has resulted in one book and several papers. The book *Lectures on Language Contact* (Lehiste, 1988) is based on her senior and first-year graduate courses over ten years. In addition to presenting sociolinguistic concepts, she incorporated her own research into these lectures, emphasizing the importance of experimental testing of sociolinguistic theories.

Her research on language contact phenomena and historical linguistics has greatly contributed to the understanding of language change in progress. In her studies "Polytonicity in the Area Surrounding the Baltic Sea" (Lehiste, 1978) and "Prosodic Change in Progress: Evidence from Estonian" (Lehiste, 1983), she concluded that in Estonian tonal patterns are formed in place of quantity degree alternations, attesting to a prosodic change in progress.

More recently she has been heavily involved with an international research project aimed at surveying the prosodic structures of lesser-known Finno-Ugric languages: "Erzya

Prosody" (Lehiste et al., 2003), "Meadow Mari Prosody" (Lehiste et al., 2005), and "Livonian Prosody" (Lehiste et al., 2008).

Lehiste's scholarly achievements have earned her prodigious honors. She was a foreign member of two distinguished academic institutions: the Finnish Academy of Science and Letters (since 1998) and the Estonian Academy of Sciences (since 2008). Lehiste was a recipient of honorary doctoral degrees from the University of Essex, Great Britain (1977), the University of Lund, Sweden (1982), the University of Tartu, Estonia (1989), and the Doctor of Humane Letters honorary degree from the Ohio State University (1999). In recognition of the significance of her scholarly work, she has been honored by the Guggenheim Fellowships (1969–70 and 1975–6), Japan Society for the Promotion of Sciences Fellowship (1979–80), Distinguished Research Award, The Ohio State University (1980), International Society of Phonetic Sciences Kay Elemetrics Award (2003), Ferdinand Johann Wiedemann Award, Republic of Estonia (2009), The American Academy of Arts and Sciences Fellowship (1990), Order of the Yugoslav Flag with Golden Wreath (1988), among several other awards and fellowships. She served on the editorial boards of several scholarly periodicals, such as the *Bibliotheca Phonetica*, *Journal of Phonetics*, and the *Journal of Interdisciplinary Music Studies*. Her extensive service to the academic community includes responsibilities associated with 12 academic societies, among them the Association for the Advancement of Baltic Studies (1974–6), the Linguistic Society of America (life member and fellow, member of the executive committee, 1971–3, president, 1980), Permanent Council for the Organization of International Congress of Phonetic Sciences (member since 1989, emeritus member since 1999), Finnish Academy of Sciences Fennistics Evaluation Group (member, 1994–6), Educational Advisory Board, John Simon Guggenheim Memorial Foundation (member, 1991–9).

In one of her best known works, *Suprasegmentals* (Lehiste, 1970), she stated that "A phonologist ignores phonetics at his own peril" (p. vi). Based on the remarkable breadth and depth of her research it may be concluded that she succeeded in defining unifying principles which enable scholars to consider the integration of speech science into the major areas of linguistic investigations; she also succeeded in elevating the discipline of phonetics to a level where it can no longer be separated from any aspects of speech communication research.

Lemke, Jay

JOANNE JUNG-WOOK HONG

Jay Lemke, as a social semiotician, has been recognized as a significant and gifted researcher in linguistics, literacy, and science education. He is senior research scientist at the University of California, San Diego, in the Laboratory for Comparative Human Cognition. He was previously professor at the University of Michigan, working in the PhD programs in science education, learning technologies, and literacy language and culture, and professor and founding executive officer of the PhD program in urban education at the City University of New York. Based on his academic background in physics and in science education, he has put his efforts at analyzing communication in science and this has led to his work on both discourse analysis and multimedia social semiotics. He has made major contributions in education, science, literacy, multimedia, analysis of language and visual images, social theory, and ideology. Two of his earliest books *Talking Science* (1990) and *Textual Politics* (1995a) have been devoted to the social semiotic approach in applied linguistics and paved the way for his work in multimodality (e.g., Lemke, 1998, 2002, 2005, 2009). Arguing that meanings are constructed across institutions and media from a critical perspective, Lemke considers language as analytical abstractions from embodied social practices with an inherent institutional role and power relations (see Lemke, 1995a). In Lemke's social semiotic approach to language, all semiosis is multimodal. That is, meaning is constructed through a variety of modalities or communicative channels across institutions and media.

Multimodality

Lemke's study of multimodality began with an investigation how to read scientific media. He explains that meanings in scientific media cannot be understood through only one semiotic modality, such as language, because it is generally constructed by combining a variety of modalities, for example, combining language use with visual expressions. That is, the meanings are understood through a combined "reading" of language with mathematical expressions and various visual-graphical representations (see Lemke, 1998).

In discussing multimodal communication, Lemke (1998, 2002, 2005, 2009) considers not only the meaning in the text but also the act of meaning making from a social semiotic perspective. Focusing on the conventional features of the genres of discourse communities as well as the resources of language, Lemke (1998, 2002) describes that meaning is conventionally construed and co-deployed with multiple semiotic modalities. Hence, meaning is functionally integrated with language, image, and sound in meaning making. In particular, Lemke (1998) argues that co-deployment helps the meanings to multiply the set of possible meanings that can be made and also the specificity of any particular meaning made against the background of this large set of possibilities.

Systemic functional linguistics (SFL) (e.g., Halliday, 1978; Halliday & Matthiessen, 2004; Martin, 1992) demonstrates the ideational, interpersonal, and textual linguistic metafunctions as functional resources for linguistic signs. Corresponding to the three metafunctions, Lemke (1998, 2002) proposes that the meaning in multimodal genres is the product of subtle, conventional, and creative interplay of "presentational," "orientational," and "organizational" aspects of meaning making across modalities. This is a culturally typical combination of

meanings about things, attitudes toward them and our addressees, and ways of organizing our language.

Presentational meanings represent a “state-of-affairs” that are construed by the ideational content of text to specify a process or relationship, its semiotic participants and circumstances. For language, this defines the sense in which we speak about something, constructing a theme or topic, and making predication and arguments. For image, it defines what is shown or portrayed, whether figural or abstract. In multimodal communication, for instance, this function may allow us to interpret the child’s unfamiliar scrawl on paper through his use of the word “cat,” or his indecipherable speech through his pantomime of cats. Orientational meanings represent “stance” toward the state-of-affairs against the background of other possible viewpoints, by depicting what is happening in the communicative relationship and what stance its participants may have to each other and to the presentational content. Organizational meanings enable the other two meanings to achieve greater degrees of complexity and precision, by making and telling which other signs go together into larger units.

Multimodality and Genre

In discussing multimodality, Lemke particularly considers the notion of genre.

A genre is maintained by the convention of a community, and in most cases serves specific functions within the system of practices of particular institutions of that community. The forms which a given genre takes as text are the traces of social signifying practices in some community, in some institutional, or at least recognized and regularly recurring situational context. (Lemke, 2005, pp. 46–7)

Considering genre structures as the meaningful functional organization of social action, he has developed the concept of multimodal communication, ranging from print media to hyper media. Focusing on the media genres in science academic community, Lemke discusses and exemplifies meaning making in the genre of printed academic articles and reports (Lemke, 1998) and in the genre of widespread computer text with image elements (Lemke, 2002). Based on discussion about traversals in hypermedia, Lemke (2009) also introduces the study of transmedia franchises, which proposes that commercial marketing has brought semiotic innovation across a variety of genres and media with intertexts of an original story or images.

For the analysis of multimodal genres, Lemke mainly focuses on how the resources for those three meanings—presentational, orientational, and organizational—are combined across semiotic modalities. However, in meaning making, these three are not by any means totally independent of one another and also not possibly combined with equal probability. These three generalized semiotic functions are the common demonstrators by which multimodal semiosis makes potentially multiplicative hybrid meanings.

Hypermodality

Lemke’s (1998) analysis of printed scientific research articles find that meaning integrates typological principles of linguistic semantics with topological modalities of visual semiotics and their extension through the hybrid resources of quantitative mathematics. By this, he suggests that the linguistic meanings are represented through visual semiotics that include all matters of page layout as well as choices of font style and typeface sizes and the use of headings and footers. Accordingly, he focuses on semiotic analysis of the functional

integration of text, tables, graphs, maps, diagrams, drawings, and photographs in formal scientific print communication.

Extending from the analysis of print media, Lemke (2002, 2005) takes a significant step to the analysis of contemporary multimedia genres in which both the print-and-image and the dynamic image-and-sound streams of film, video, and animations are considered. In particular, Lemke (2002) focuses on meaning making in multimedia Web sites and discusses the presentation of scientific information for both technical and lay users. He argues that hypermodality is more than multimodality and goes beyond the conventions of traditional multimodal genres, in that it mainly looks at interactions and interconnections among word-, image-, and sound-based meanings in hypermedia rather than simply looking at juxtaposition of the meanings.

Lemke discusses and examines the resources available for producing syntagmatic relationships across different semiotic resource systems, comparing these with the resources available within more semiotically homogeneous texts. Generally, he discusses the multimodal communication based on two main focuses: the resources for meaning making across semiotic modalities, and the linkages among traversals which include text units, visual elements, and sound units.

Hypertext Semantics: Traversals

Lemke (1998, 2002, 2005, 2009) states that, while the print media genres include images and figures constrained by multimodal genre-specific conventions, the hypertext media genres go beyond the conventions. Hypertext is not just a plain text, but rather a medium and a technology to construct sequences of textual units. The textual units may be a single word, a phrase, a paragraph, or a whole page, to become source and target of a hypertext link. The sequences of textual units are not uniquely determined by authors/designers of a particular hypertext web, but by readers/users to make meanings of their own on the web of related elements provided. While Web surfing, the readers/users generate trajectories within a Web site, generally cumulating the wealth of details and the models of a richly drawn universe over long stretches of ordinary narrative or novelist text. A trajectory, a new kind of multimodal syntagm, becomes a traversal when it crosses between Web sites, across institutional, genre, and even language and culture boundaries. According to Lemke (2002, 2009), traversals are like changing cable TV channels: moving on short timescales from news to talk to comedy to music, from one institutional site to another, one genre to another. In this regard, traversals are not limited within the institutional conventions of each separate genre or Web site, which allows hypermodality to be understood as a phenomenon beyond generic-specific conventions.

For discussion of hypermodality, Lemke (2002) illustrates some principles regarding multimodality and hypertext semantics and exemplifies the domain of the US National Aeronautics and Space Administration (NASA) for the short-range scale of single pages, page-pairs across single links and very short traversals of Web site pages, to draw on the experience of analysis in the context of much longer traversals. He explains that hypertext semantics is very much like intertextual semantics (see Lemke, 1985, 1995b), in that it particularly focuses on construction of meaning relationships along traversals. Meaning relationships construed across a single hypertext link can be compared with those between texts and within texts on longer scales in intertextual study. In particular, Lemke (2002) states, in hypermodality, many verbal relations are conceptualized as visual metaphors, such as chains, narratives scenes, and viewpoints. The meaning relations along traversals are discussed based on semantic connections in the aspects of presentational, orientational, and organizational relations.

Transmedia Franchises

Considering the notion of traversals which represents meaning made across institutional boundaries, media, genres, settings, and context of situations, Lemke (2009) shows another step for the discussion of multimodal communication: transmedia franchises. As a social semiotician, looking at media, closely related to their context of production and circulations as well as those of their use or consumption, Lemke argues that commercial marketing is often the cutting edge of semiotic innovation in media production. Lemke (2009, p. 292) describes that “transmedia franchises place cobranded content, and with it their ideological messages and inducement to consumption, throughout our virtual and spatial environment, where our individual traversals will encounter it again and again.” For instance, the *Star Wars* brand crosses both media and genres, appeared as films, books, comics, computer and videogames, music, merchandise, theme park rides/attractions, and advertisements seen in print, television, and online. The meanings constructed in each of all these various media and genres are not entirely independent of the others, but constructed as intertexts of the original film. Hence, for discussion about the meaning effects of transmedia franchises, Lemke (2009, p. 293) emphasizes that

we need to understand the economic imperatives of mass markets, where there is a careful calculation of the relative advantage of creating media that appeal to the widest possible range of consumers versus those whose appeal to a particular market is based on contrasting its identity and image with those of other markets.

Levinson, Stephen C.

PILAR GARCES-CONEJOS BLITVICH

Stephen C. Levinson is currently the director of the language and cognition group at the Max Planck institute for psycholinguistics in Nijmegen, the Netherlands (see www.mpi.nl/people/levinson-stephen). Professor Levinson received his BA in social anthropology from the University of Cambridge in 1970. He received his MA in linguistic anthropology in 1973, and his doctorate in linguistic anthropology in 1977, both from the University of California, Berkeley. Prior to his current appointment, Levinson held, among others, the following positions: lecturer and reader at the University of Cambridge and visiting associate professor at Stanford University.

Levinson's research focuses on linguistic diversity and its implications for theories of human cognition. He argues that this diversity is made possible through an underlying, universal pragmatic base. Fundamentally, the different strands of his research tie back to the belief that the capacity for social interaction holds the key, among others, to human evolution, language evolution, and the building blocks of social systems.

His understanding that language diversity is closely connected to a universal pragmatic base relates clearly to his interest in pragmatics as a field of which he can rightfully be considered one of the founding fathers. He wrote the first monograph on the topic (Levinson, 1983), and has continued to contribute actively to the field in the following three decades. Another monograph on pragmatics (Levinson, 2000) focuses on generalized conversational implicatures. In his analysis, Levinson unveils three universal inference rules or heuristics, inspired by Grice's conversational maxims, of preferred interpretation or language construal.

The major role of social interaction for Levinson takes center stage in the book that he coauthored with Penelope Brown, *Politeness: Some Universals in Language Use* (1987). Initially published in 1978, the work by Brown and Levinson generated enormous interest and triggered what is now considered one of the most well-researched subfields, even a movement, within interactional sociolinguistics and related disciplines. The book has been translated into numerous languages and its tenets have been applied cross-culturally to the study of politeness phenomena. Levinson's interest in social interaction has been the focus of over 20 of his papers and of a long collaboration with Brown on fieldwork among indigenous groups in Mexico and New Guinea.

This interest in social interaction is taken to a new level by Einfield and Levinson (2006). In it, human sociability is presented as a new interdisciplinary field, largely unexplored, whose focus is to ascertain the foundations of human sociability with the aim to produce an emergent system of human sociality and social interaction. The interconnections between language diversity, sociality, and culture are further explored in Levinson and Jaisson (2006) which brings together papers that delve into the interconnections between biology and culture. The creation and transmission of culture is seen as a historical process rooted in natural selection. In line with the centrality that human interaction, based on cooperation and communication, has in Levinson's thought, a central claim is made regarding the possibility that cognitive complexity may have been driven by both the cooperation that underlies culture and the need to protect it.

Levinson's view that inherent diversity is at the core of human language and cognition was explored in Gumperz and Levinson (1996). Despite the exploratory nature of most

papers and some partial dissent, the book shows sympathy toward the Humboldt–Sapir–Whorf hypothesis and strives to find acceptable formulations for the sense behind the hypothesis. Further explorations of language diversity, also tied to the revival of neo-Whorfian standpoints, can be found in Levinson and Wilkins (2006) which focuses on the linguistic structuring of space, illustrated crosslinguistically and cross-culturally. Its crucial claim is that individual linguistic systems condition the conceptualization of spatial relations, contrary to what was previously thought.

The relationship between language diversity, language categories, and thought was tackled from a developmental perspective by Bowerman and Levinson (2001). Their conclusions, although varied, seem to suggest strongly that the widely held belief that language reflects preexisting categories is erroneous, and that universalist assumptions are not borne out by cross-cultural evidence. On the contrary, many linguistic categories have to be learned from usage. A child acquiring a language learns how to construct macro-concepts that are part of his/her cultural milieu. Thus language invades thinking because it is a good tool to think with.

Professor Levinson's active scholarship continues: he frequently contributes to prestigious journals and remains very active in his leadership of cutting-edge, interdisciplinary research projects. He is currently involved in the organization of the world's largest digital archives of endangered languages. Professor Levinson is also very actively engaged in service to the profession. He serves as the editor and coeditor of two prestigious book series—Cambridge University Press and Mouton de Gruyter—and is a member of the editorial board of prestigious international journals. His stellar academic career has been recognized with diverse honors (fellow of the British Academy; Stirling Prize from the American Anthropology Association; member of the Academia Europea). Professor Levinson's contributions to linguistics and related fields have inspired the work of other scholars in ways matched by very few.

Lexical Access in Bilingual Visual Word Recognition

SYBRINE BULTENA AND TON DIJKSTRA

Introduction

When a book is translated, the meaning of the original should be preserved in the words of the target language. These words will usually differ from the original in their spelling (orthography) and pronunciation (phonology), but occasionally translation equivalents are similar in form across languages. For instance, a comparison of the English sentence *The tennis ball hit my leg* to its Dutch translation *De tennisbal raakte mijn been* immediately reveals the lexical similarity between the two languages. *Tennis* is form-identical in both languages, *ball*, *the*, and *my* have a clear orthographic and phonological overlap with *bal*, *de*, and *mijn*, whereas *hit* (Dutch: *raakte*) and *leg* (Dutch: *been*) are totally different in the two languages. Confusingly, the word forms *hit* and *leg* also exist in Dutch, where they mean *pony* (or also *successful song*) and *lay*, respectively.

Some people understand and speak two languages with sufficient skill to engage in a conversation in either one of them. Research on visual word recognition involving these *bilinguals* in their first language (L1) and second language (L2) indicates that word forms and meanings of different languages are stored in one integrated lexicon rather than separately by language. In terms of processing, it has been shown that words from both languages are accessed simultaneously rather than in a language selective manner, implying that words that are similar in form, meaning, or both are co-activated irrespective of their language. In a bilingual sentence context, parallel activation of words from different languages is also apparent, but may be modulated. In this entry, we will elaborate on these issues considering empirical evidence from both behavioral studies (measuring reaction times or RTs and error rates) and neuroimaging studies (involving EEG and fMRI data).

The Bilingual Lexicon Is Integrated

Bilingual studies suggest that words from different languages are stored in a common database. Van Heuven, Dijkstra, and Grainger (1998) showed that the recognition speed for a word in one language was affected by the number of similar words (called “neighbors”) in another language. For instance, the recognition of the English word *work* was affected by the number of Dutch words that were similar in spelling, such as *werk* (meaning ‘work’) and *vork* (meaning ‘fork’). EEG data also demonstrated cross-language neighborhood effects in bilingual word recognition. When bilingual participants read words in a blocked L1 or L2 context, a larger N400 effect (which is an EEG marker for ease of semantic integration) is found for words with many neighbors in the other language, suggesting more difficulty in processing (Midgley, Holcomb, Van Heuven, & Grainger, 2008). It is hard to see how word candidates from different languages could affect target processing if these forms were stored separately. An analysis of 30 neuroimaging studies by Indefrey (2006) suggests that the same areas in the brain are recruited for L1 and L2 processing, but there is a difference in strength of activation between L1 and L2. Bilingual speakers with late L2 onset,

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0685

low L2 proficiency, or little L2 exposure tend to show stronger brain activation for processing the L2 than the L1. In all, this evidence points to an integrated bilingual lexicon.

The Bilingual Lexicon Is Accessed Language-Nonselectively

A large majority of bilingual studies involving a variety of experimental techniques indicate that bilingual word recognition involves an early phase in which word candidates from different languages are considered (at least when the same alphabet is involved). Many of these studies included words that are similar across languages, called “cognates” and “false friends.” Cognates are translation equivalents that are identical or similar in their orthography across languages, such as *tennis* in the opening example. Word forms like *leg* that share their word form but not their meaning across languages are called “noncognate interlingual homographs” or “false friends.” The crosslinguistic form overlap of cognates and interlingual homographs has been used by researchers to explore whether words from different languages are co-activated during the reading, listening, and speaking of bilinguals. The reasoning has been that, if the responses to such “special” items differ from those to one-language control items, this is evidence that both readings of the items have become active and affect each other. In the following paragraphs, we will consider this research involving cognates and false friends.

Cognates are processed more quickly and with fewer errors than words existing in only one language (e.g., Sánchez-Casas, Davis, & García-Albea, 1992; Dijkstra, Van Jaarsveld, & Ten Brinke, 1998). Brain waves for cognates are also different from those for matched control words (e.g., in terms of the N400 component, marking semantic integration; Yudes, Macizo, & Bajo, 2010). The processing advantage for cognates is called the *cognate facilitation effect*. It is usually larger in L2 than in L1, although it also occurs in the mother tongue if the bilingual is sufficiently proficient in the foreign language in question (Van Hell & Dijkstra, 2002). Stronger facilitation effects can arise if the cognates exist in three languages rather than in two, like the word *echo*, which exists in English, German, and Dutch (Lemhöfer, Dijkstra, & Michel, 2004).

The cognate effect must somehow be a consequence of the combination of overlap in meaning (semantics), spelling (orthography), pronunciation (phonology), or all of these across languages. All three characteristics contribute to the effect (Dijkstra, Grainger, & Van Heuven, 1999) and its size depends on the amount of between-language overlap. Dijkstra, Miwa, Brummelhuis, Sappelli, and Baayen (2010) found larger facilitation effects for cognates with a larger form overlap (with constant meaning overlap). For example, when Dutch–English bilinguals performed an English lexical decision task, RTs were faster to *alarm* (*alarm* in Dutch) than to *rain* (*regen* in Dutch), which were, in turn, faster than RTs to *bike* (*fiets* in Dutch).

The cognate facilitation effect suggests that cognates do not have a completely independent representation in the two languages. One proposal for the representation of nonidentical cognates is depicted in Figure 1 (also see Voga & Grainger, 2007). It consists of a separate but overlapping orthographic representation linked to an also overlapping or even shared semantic representation. According to this view, the cognate facilitation effect in many tasks arises because both word forms become active during the presentation of one of them and then converge on the common meaning representation. If a task requires making a distinction between the two cognate representations, a cognate inhibition effect may occur. This is the case, for instance, in language decision, where participants press one of two buttons depending on the target’s language (Lavaur & Font, 1998). In other words, form overlap helps if one does not have to distinguish the two readings of the cognate, but it hinders if one must differentiate them.

Figure 1 Dutch (D) and English (E) representations of the nonidentical cognate *tomaat*

False friends are alike in their written form, pronunciation, or both for different languages, but have quite a different meaning (e.g., English *coin* means ‘corner’ in French). When Dutch–English bilinguals read or hear the English (L2) variant of Dutch–English false friends, the words in both languages become active. In many tasks, such as lexical decision and word naming, the RTs for false friends are often longer than for control words (Smits, Martensen, Dijkstra, & Sandra, 2006).

False friends suffer from an interference effect that depends on their relative frequency in the two languages. For instance, a relatively low-frequency English word like *ramp* is most strongly interfered with by a high-frequency Dutch counterpart like *ramp* (meaning ‘disaster’). This slowing-down effect can be reduced and even eliminated when pure Dutch words are excluded from the stimulus list. If the task is generalized to answering the question “is the presented item a word in any language?” then the false friends are processed even faster than control words (Dijkstra et al., 1998). Thus, the ultimate response to false friends depends on the list in which they occur and the task that is executed.

In an fMRI study, Van Heuven, Schriefers, Dijkstra, and Hagoort (2008) found that the conflict between the two false friends could also be observed in the brain, in particular in the frontal areas that are associated with the monitoring and resolution of conflicts during task performance (see Kerkhofs, Dijkstra, Chwilla, & De Bruijn, 2006, for analogous effects in EEG data). There also was a clear task effect. Much stronger competition effects arose when the lexical decision task required the participant to respond “yes” only to the L2 reading of the false friend (an L2-specific lexical decision task) than when either reading was correct (a generalized lexical decision task, in which both L1 and L2 words were linked to the response “yes, it is a word”).

On the basis of these and other studies, the representation in Figure 2 is proposed for false friends. A Dutch–English word like *rug* (meaning ‘back’ in Dutch) has two representations, one for English and one for Dutch. Both representations are characterized by their own frequency of usage and may differ in meaning and pronunciation.

Lexical Access to Words in Bilingual Sentence Processing

Empirical research investigating how bilingual word recognition is affected by sentence context has been initiated only recently. Both behavioral and ERP studies indicate that

Figure 2 Dutch (D) and English (E) representations of the false friend *rug*

sentence context can affect bilingual word recognition. A regular finding is that semantically constraining sentences can reduce or even eliminate the effects of a nontarget language on cognate and false-friend processing, while such effects remain in low-constraint and neutral sentence contexts (e.g., Altarriba, Kroll, Sholl, & Rayner, 1996).

Processing of *cognates* in sentence context has been studied by Schwartz and Kroll (2006). They asked Spanish–English bilinguals to name cognates and false friends that were inserted in sentences that were highly or less constraining from a semantic perspective. Effects of the nontarget language reading mostly persisted for cognates in sentence context. For example, cognate facilitation was still found in low-constraint sentences. Interestingly, the cross-language effects in high-constraint sentences disappeared for good comprehenders.

Van Hell and De Groot (2008) also found cognate effects in low-constraint sentences in an English lexical decision task performed by Dutch–English bilinguals, and in forward (Dutch-to-English) or backward (English-to-Dutch) word translation tasks. In a high-constraint sentence context, the cognate effects disappeared in English (L2) lexical decision and strongly decreased (but remained significant) in both translation tasks. This suggests that even in high-constraint sentences nonselective activation initially occurs, which is then followed by lexical selection. Nevertheless, semantically rich sentences were apparently able to modulate the bilingual word recognition process in at least three different tasks.

Duyck, Van Assche, Drieghe, and Hartsuiker (2007) had Dutch–English bilinguals perform an English lexical decision task on form-identical and nonidentical cognates that were presented in low-constraint sentences. Facilitation effects were found relative to control words for all cognates. The obtained effects were at least as large as the effects for the same items observed in isolation. Next, an eye-tracking experiment, in which sentences with their cognates and a continuation phrase were represented as wholes on a computer screen, replicated the cognate effect for identical cognates, but not for nonidentical ones.

With respect to *false friends*, initial studies suggested that the sentence context constrains cross-language activation (e.g., Schwartz & Kroll, 2006). The explanation of these null effects differs across researchers (see, e.g., Schwartz & Arêas da Luz Fontes, 2008), but there is recent evidence indicating that cross-language effects of false friends in sentences can occur. Using eye-tracking, Libben and Titone (2009) found longer reading times for French–English homographs in both low- and high-constraint sentences than for controls, while reading times for cognates were significantly faster. Their data suggest that the

cross-language activation of homographs in high-constraint sentences is short-lived, implying that only the contextually relevant meaning remains activated. This conclusion fits with monolingual studies involving ambiguous words, which often report that sentence context kicks in only following an initial co-activation of both readings of an ambiguous word (see Swinney, 1979).

Additional evidence for a homograph effect comes from Elston-Güttler, Gunter, and Kotz (2005). They presented German–English bilinguals with L2 sentences ending in a German–English homograph or an English control word. For instance, the sentence *Joan used scissors to remove the* was followed by the test word *tag* (the German word for ‘day’) or a control word (*label*). Next, an L2 target word was presented that could be the translation of the L1 reading of the homograph. In the example, the target word *day* (the English translation of *tag*) was presented for an English lexical decision. Both behavioral and EEG data revealed semantic priming effects, but only when participants had watched a German film prior to taking the test did they show a facilitatory effect for the homograph condition. This suggests that the German reading of *tag* was only activated enough to induce semantic priming on *day* following the German film.

Bilingual Word Recognition Models

The empirical findings of an integrated lexicon and nonselective access have been incorporated into several models for bilingual word recognition, such as the implemented Bilingual Interactive Activation models (BIA and BIA+; Dijkstra & Van Heuven, 2002), the Revised Hierarchical Model (RHM; Kroll & Stewart, 1994), and the Inhibitory Control model (IC; Green, 1998). The focus of BIA, RHM, and the IC model is on the processing of single words; only the BIA+ model considers word processing in a bilingual sentence context. It proposes that word recognition in sentence context may be modulated by sentence characteristics such as its semantics. However, neither complete nor implemented models of bilingual sentence processing are currently available.

Lexical Borrowing

FRANK E. DAULTON

As seen in ancient Coptic codices containing Hebrew loanwords, virtually every language has increased its vocabulary by borrowing from other languages. *Lexical borrowing* typically is the adoption of individual words or even large sets of vocabulary items from another language or dialect. It can also include roots and affixes, sounds, collocations, and grammatical processes. It has profound implications for various aspects of applied linguistics, including sociolinguistics and foreign-language learning.

Sometimes a word is borrowed in a way that preserves its original form and meaning. Other times words are adapted to the borrowing language's phonology and morphology. And another possibility is *loan translation*—or the creation of a calque—where a word or phrase is translated word for word; for example, *loanword* is a calque of the German *Lehnwort* and *loan translation* a calque of *Lehnübersetzung*.

The most borrowed words refer to technology (e.g., *engine*) and names for new artifacts (e.g., *taxi*). By contrast, the basic vocabulary (e.g., *eat*, *moon*, *be*) and function words (e.g., *the* or *and*) are less commonly borrowed (see Haspelmath & Tadmor, 2009). Sometimes words are borrowed despite native equivalents (e.g., *akushon* 'action' in Japanese versus the native *kodou*), usually because new words carry fresh nuances such as sophistication.

Lexical borrowing is one of the first phenomena in *language contact* (Thomason & Kaufman, 1992)—when two or more languages or varieties interact. This can involve immigrants, traders, conquerors, and—in today's world—foreign mass media such as movies and music. The degree and nature of borrowing reflect the contact between languages and cultures.

Sometimes a borrowed word's route is indirect or circuitous. Many English words in Korean (known as *Oi-rae-eo*) have arrived via Japan (where they are known as *gairaigo*) (e.g., Kang, Kenstowicz, & Ito, 2008); similarly English loanwords in Finland are typically borrowed from neighboring Sweden (see Ringbom, 2007). There is also *reborrowing*, where a word travels from one language to another and then back, altered; for example, French *le biftek* is borrowed from English *beefsteak*, where the English *beef* was originally from the Norman *bœuf*.

Lexical items are typically "borrowed" by an individual or group, and may thereafter enter common usage. Factors that encourage dissemination include the mass media and current events. For instance, the loanword *tero* ('terrorism') in Japanese bolted to prominence following the intense and extended media coverage of the 9/11 attack (Daulton, 2008). However, most borrowed words face obscurity and eventual extinction.

Often borrowings are dealt with differently (from native vocabulary) phonologically and morphologically; this is known as *lexical stratification*. In English, Latinate and Germanic morphemes pattern differently (Chomsky & Halle, 1968), and in German, English borrowings take different plural suffixes (-s).

Notable Examples

An exemplar of lexical borrowing is the Roman Empire's borrowing from Greece. Around 272 BC, the Romans began adopting features of Greek culture, including words such as

2 LEXICAL BORROWING

sumbolum ('symbol') and *balineum* ('bath') (Holmes & Schultz, 1938). This "Hellenization" led also to the addition of the letters Y and Z to the alphabet to represent Greek sounds (Sacks, 2003). Reflecting Rome's desire for Greek knowledge, many Latin scientific words are actually Greek loanwords (Holmes & Schultz, 1938).

The sources of a language's loanwords can be diverse and, in the case of both Malay and Indonesian, loanwords have come particularly from Sanskrit, Arabic, and European languages (Jones, 2007). When the rulers in Sumatra adopted Old Malay as their official language in the seventh century, they resorted to Sanskrit to express concepts not found in Malay, such as *tata* ('rules'). Around the 14th century, Islamization brought Arabic and Persian words. Then, during the 16th century, Portuguese traders brought names for previously unknown European articles.

Lexical borrowing can befuddle historical linguists. For instance, Armenian borrowed so heavily from Iranian languages that, for many decades, linguists mistook Armenian for a branch of the Indo-Iranian language family (Waterman, 1976).

English and Borrowing

Lexical borrowing has fundamentally influenced English. During the Middle Ages and the Renaissance, English speakers encountered the intellectual centers of the Arab world, leading to a flow of lexical borrowings, notably involving technology and literature. Modern English also displays the borrowing that occurred in the 1500s and 1600s from Latin, French, and Greek.

Invasion and occupation lead to intense language contact and lexical borrowing, and the Norman Conquest of 1066 transformed English (see McCrum, MacNeil, & Cran, 1986). The conquerors added a layer of French vocabulary to the Old English spoken by the natives, and over the next three centuries, the mix spawned Middle English. Even after the decline of Norman, French retained its status as a prestige language, and the tendency for Norman-derived words (e.g., *reception*) to have more formal connotations than Germanic ones (e.g., *welcome*) continues today.

Immigration into English-speaking countries has also enriched English. Many English speakers are familiar with *schmuck*, Yiddish for a foolish person. Also, from Italian immigrants came words such as *paparazzi* and *mafia*, and from Hispanic cowboys and immigrants, *pronto* and *sombrero*.

Given its global status, English has also supplied vocabulary to many languages, including one of the great lexical borrowers—Japanese. Historically speaking, English during the first few centuries following the Norman Conquest (Miller, 1967) or Polish after the fall of the Soviet Union (Arabski, 2006) are among the few languages that have been as hospitable to loanwords as Japanese (see also Haspelmath & Tadmor, 2009). Japanese contact with English began more than 200 years ago, contact with other European languages goes back 500 years, and heavy lexical borrowing from China preceded that. English words have become especially important since World War II, and today some 10% of the Japanese lexicon originates from English, with words such as *mama* and *bai-bai* (bye-bye) among babies' first words (see Daulton, 2008).

Factors That Encourage Lexical Borrowing

Lexical borrowing is very common, arguably natural and unavoidable. For instance, it even occurs in sign language (see Battison & Brentari, 2003). The causes and factors that encourage lexical borrowing are multiple and interwoven. Lexical gaps, particularly involving emerging technology, often induce lexical borrowing. For instance, the word *computer*—describing an object invented in an English-speaking country—is known as *computer* in

Dutch and German, *computadora* in Spanish, *konpyuuta* in Japanese, *komputer* in Indonesian and Malay, and *kompyuta* in Swahili.

Of course, the borrowing society's attitudes toward foreignisms greatly affect lexical borrowing. If a people associate the culture and technology of a foreign country with power, chic, and other attractive characteristics, it is more likely that words will be borrowed from that *prestige language*. And a country may possess a unique feature that greatly facilitates lexical borrowing, such as the *katakana* script in Japan. Not only does *katakana* allow any Western word to be immediately borrowed and universally legible—in contrast to Chinese characters—it distinguishes and psychologically isolates Westernisms, thereby instilling confidence in the integrity of the native lexicon (see Kay, 1995).

Reactions to Lexical Borrowing

Usually, the public welcomes useful, relevant loanwords. This is especially so if loanwords connote sophistication, intelligence, stylishness, and so on. It is often the younger and better educated who are the most disposed toward loanwords (e.g., Loveday, 1996). The youth especially can be active innovators—creating their own *pseudo-loanwords* by innovatively combining foreign elements (e.g., *gorin*, 'goal' + in, Korean for a successful basketball shot). Another possibility is the combining of foreign and native elements (e.g., *paniku-ru*, 'panic' + the verbal inflection -ru, Japanese for 'to panic') to create *hybrids* (or *loanblends*).

Yet there is often resistance. For instance, Japan eliminated words of English origin prior to and during World War II, including many baseball terms yet to return (Daulton, 2008). And even today, both Japanese and Korean newspaper editorials blame English-based loanwords for the destruction of the native language and culture. Opponents may point out that the comprehensibility of loanwords can be particularly low with the elderly (e.g., Loveday, 1996).

The best known case of loanword resistance involves the Académie française, officially charged with the purification and standardization of the French language (in France) since 1635 (see van Gelderen, 2006). As French culture has come under increasing pressure from English media, the Académie has famously tried to prevent its Anglicization. For example, it has recommended that loanwords such as *hotdog*, *software*, and *e-mail* be replaced by the French *chien chaud*, *logiciel*, and *courriel* (or *courier électronique*) respectively. However, around the world, isolated outcries against loanwords or even government action tend to have limited ability to stop lexical borrowing.

The Adaptations of Borrowing

When words are borrowed, their forms and meanings often change.

Formal Changes

If the phonology of the donor language conflicts with the borrower, incoming words must be adapted to meet the structural requirements of the borrowing language (e.g., by the insertion of vowels and the replacement of nonexisting phonemes). An example of English adapted to Hawaiian, which has very few phonemes, is *Mele Kalikimaka* ('Merry Christmas'), where consonants have been replaced and consonant clusters broken up. Especially popular loanwords may be subject to *shortening* (or *truncation*) to facilitate their use, as when *department store* becomes *depaato* in Japanese (Daulton, 2008). Differing scripts (e.g., the Roman alphabet in a country where it is foreign) necessitate the further step of transliteration.

4 LEXICAL BORROWING

While transliteration is common, distinguishing loanwords by a special script is relatively rare. The use of italics in English is an example. Over time, as use of the borrowed word becomes widespread, italics (along with accent marks) may be less regularly applied or dropped, as with ‘*deja vu*’ (*déjà vu*). By contrast, while Japan’s use of *katakana* for Western loanwords is a similar aid to literacy, no matter how widely used a Western loanword in Japanese becomes, with rare exceptions, it will always be written in *katakana* (Daulton, 2008).

Semantic Changes

There can also be semantic (i.e., meaning) changes to loanwords, which can occur when they are borrowed or over time. A loanword’s meaning—or one of them—can be completely different from the original; this is sometimes referred to as *semantic shift*, and examples are rare but conspicuous (e.g., English *demand* vs. French *demande* ‘request’). *Semantic restriction*, also known as *semantic narrowing* or *semantic specialization*, is when only one meaning/usage of a word is adopted (e.g., Korean *miting* ‘meeting’ = a blind date); it is the most common type of semantic change, as loanwords usually fill specific lexical gaps (Hatch & Brown, 1995). *Semantic extension* is when a loanword includes more meanings than its original borrowed word (e.g., Japanese *handoru* ‘handle’, including bicycle handlebars).

A more subtle semantic change involves connotation or feeling. *Semantic downgrading* (or *pejoration*) is when a more negative connotation is given to a word, as when *aisu* ‘ice’ means a *usurer* in Japanese (Daulton, 2008). Meanwhile, in *semantic upgrading*, positive connotations are attached, which is common in marketing (see Loveday, 1996). Over time, loanwords can lose one connotation and even come to hold the opposite.

Additionally, a word’s part of speech can change when borrowed, and any loanword in Japanese can be verbalized by the use of *suru* ‘to do’, as in *tenisu suru*—literally meaning *to tennis* (Daulton, 2008).

The Implications of Lexical Borrowing for Foreign/Second Language Study

Lexical borrowing leads to *language transfer* (or *learning transfer*), where L1 features are incorporated into the target L2. Today language transfer is seen as a beneficial phenomenon (see Ringbom, 2007) that affects all aspects of language learning—phonology, syntax, semantics, and pragmatics (Ellis, 1994). While language transfer ultimately facilitates learning, in the short term increased production is accompanied by developmental *transfer errors* (or *interference*), or conversely *avoidance* may occur.

Semantic restriction and semantic extension (see above) lead to a loanword having fewer meanings (*convergence*) or more meanings (*divergence*) than the original borrowed words. *Convergent cognates* are the more common phenomenon, as when *tsuna* in Japanese refers to the meat but not the fish.

In historically unrelated languages, loanwords tend to originate from low-frequency words (see Ringbom, 2007), which have limited value as cognates. An exception may be Japanese, where members from nearly half of the high-frequency word families of English (e.g., *ability* and *access*) have become common loanwords in Japanese (e.g., *akusesu* and *abiriti*) (Daulton, 2008).

Conclusions

Lexical borrowing is often a major influence on the evolution of languages, and shared words link many languages and cultures.

Lexical Bundles and Grammar

VIVIANA CORTES

Early studies that identified and analyzed recurrent multiword units were conducted from a rather impressionistic perspective. However, advances in the use of computers and the collection of large language corpora used for linguistic analysis brought about important changes in the research methodologies used in the identification of this type of word combination. The 1990s and the beginning of the new millennium brought about a body of research made up of a considerable number of empirical studies that attempted to define and classify important fixed word combinations (Nattinger & DeCarrico, 1992; Altenberg, 1998; Butler, 1998; Hunston & Francis, 1998; Moon, 1998; Wray, 2002; Schmitt, 2004). Biber, Conrad, and Cortes (2003) explained that these studies present several differences, namely the way in which they identify and describe different types of multiword units (structurally, functionally, or both), the methodologies used to identify these expressions (perceptual importance, frequency, or other), the particular type of fixed expression studied (continuous sequences, collocational frameworks or frames, lexicogrammatical patterns, two-word combinations or longer expressions, pure idioms, etc.), and the corpora used for the analysis, ranging from small corpora of less than 100,000 words to corpora of more than 100 million words sampled among various registers. Among those studies that focused on frequency as a salient quality of these word combinations, several investigations surveyed previous literature in search of a list of expressions that were perceived as fixed and frequent and checked their relative frequency in a corpus of texts from a particular register (Nattinger & DeCarrico, 1992). Other studies used specially designed computer programs to identify the most frequent expressions in a register (Altenberg, 1998). This last methodology is the one that was used by Biber, Johansson, Leech, Conrad, and Finegan (1999) to identify the type of recurrent word combinations they labeled *lexical bundles*.

Lexical bundles are a very particular type of word combination. Biber, et al. (1999) define lexical bundles as “the combinations of words that in fact recur most commonly in a given register” (p. 992). Lexical bundles can be described as extended collocations, groups of three or more words that occur together in a register, regardless of their structure or idiomacity. Examples of lexical bundles in conversation, for example, are expressions such as *what do you mean*, *I don't know why*, and *that's a good idea*, while in academic prose frequent bundles are *in addition to the*, *the point of view of*, and *in the context of*, to mention only a few. Bundles are identified by means of a computer program that looks at all groups of *n* words in a corpus (three, four, five words, etc.). Only those expressions that meet a previously established cut-off point are considered lexical bundles. It is essential to explain that these cut-off points are established by convention and only to ensure that the multiword expressions identified by the computer program are frequent. Biber, et al. (1999) suggested ten times in a million words as the frequency cut-off point for a four-word combination to be considered a lexical bundle, but since then many other studies have been much more conservative raising the frequency point to twenty or forty times in a million words (Biber, Conrad, & Cortes, 2004; Cortes, 2004). In the case of three-word lexical bundles, a much higher cut-off point has to be established, as these three-word expressions are much more common in any register. On the other hand, five- or six-word expressions need to reach a lower cut-off point, as these are much less frequent. In addition, in order to avoid any idiosyncratic use of these expressions by one or few language users, range

needs to be considered, that is, the expression has to occur in five or more different texts across a corpus. Biber, et al. (1999) presented a comprehensive list of all the four-, five-, and six-word lexical bundles they could identify in the everyday conversation and academic prose sections of the Longman Corpus.

Cortes (2004) explains that recurrent word combinations can be described in terms of three major characteristics: idiomaticity, fixedness, and frequency. These characteristics should be seen as three interacting continua that can be used to describe any combination of words that frequently occur together. Idiomaticity describes the relationship between the meaning of the word combination and the meaning of the independent words that make up that expression. At one end of this continuum we can find obscure expressions such as *kick the bucket*, in which the meaning of the whole phrase (*die*) has no relationship to the meaning of the words that make up the fixed expression. At the opposite end of this continuum, we can find expressions like *as a result of*, which is completely transparent: the meaning of the expression derives from the meaning of each of the words that make the phrase. Fixedness refers to the degree of flexibility that an expression can accept. At one end of this continuum we will find expressions that do not accept changes or that accept only inflectional changes as in the case of *to be in a fix*, which accepts changes in the verb for tense and modality. At the opposite end, we will find expressions that are in complete free variation, frames that can be filled in with certain word classes (e.g., the _____ of _____). Finally, when frequency is under consideration, some fixed expressions tend to be more frequent in certain registers. For example, expressions such as *kick the bucket* are more frequent in fiction and even in this register they only appear 0.5 times in a million words, while expressions like *on the other hand* can occur more than 100 times in a one-million-word corpus of academic prose. If these three characteristics are used to describe lexical bundles, it can be easily noted that lexical bundles are mostly transparent, as they carry very little idiomatic meaning, and they are fixed, because the program that identifies the bundle does so for those forms that are the most frequent. For example, the lexical bundle *the objective of this study* was identified in a corpus of research article introductions while *the objectives of this study* was also used in the corpus but the frequency was not high enough for the expression to be considered a lexical bundle (Cortes, 2009). Finally, lexical bundles are extremely frequent. A cut-off point of twenty times in a million words denotes a considerable frequency but many three- and four-word lexical bundles occur more than 100 times in a million words in a particular register.

With the exception of Salem's study of French frequently occurring expressions (1987), Butler's studies of frequent fixed expressions in Spanish news corpora (1998), a study of lexical bundles in academic registers in Spanish (Tracy-Ventura, Cortes, & Biber, 2007) and an analysis of these expressions in conversation and academic texts in Korean (Kim, 2009), most of the research on recurrent word combinations identified by frequency has been conducted in English. In addition, in spite of the fact that, by definition, lexical bundles are frequent combinations of three or more words, most studies of these expressions have focused on four-word bundles. The main reasons for this length are related to the internal structure of bundles and their frequency: four-word bundles often include three-word bundles in their structure (for example, the bundle *as a result of* contains the three-word bundle *as a result*), and four-word bundles are ten times more frequent than five-word bundles, which results in a larger variety of structures and functions for further analysis.

Structural Analysis and Classification of Lexical Bundles

The way in which lexical bundles are identified makes their structure rather peculiar, in the sense that lexical bundles are usually not complete structural units and they often present fragmented phrases or clauses with new embedded phrase or clause fragments.

They do, however, have strong grammatical correlates, which facilitates their classification into various basic structural groups. These structural groups seem to be strongly connected to the register that originated the bundles. In everyday conversation, for example, lexical bundles are often clausal, made up of a verb phrase followed by fragments of some type of complement. Expressions such as *I don't know how* and *I want you to* are examples of this type of structure. In academic prose, on the other hand, most bundles present phrasal structures, made up of noun phrases or prepositional phrases with some noun or prepositional phrase fragments embedded in the first phrase, in expressions like *as a result of the*, *the aim of the study*, or *the beginning of the*. Biber, et al. (2004) introduced three major structural types of lexical bundles (p. 381).

Lexical Bundles That Incorporate Verb Phrase Fragments

This group includes “clausal” lexical bundles made up of some verb phrase (VP) or VP fragment with or without personal pronoun subjects, both in statement or question form. Three main subcategories can be distinguished in this group:

1. (connector) + personal pronoun + VP fragment: *you don't have to*, *well I don't know*, *It's going to be*;
2. verb phrase (with passive or non-passive verbs): *is going to be*, *have a lot of*, *take a look at*, *is based on the*, *can be used to*;
3. yes-no/wh-question fragments: *are you going to*, *do you want to*, *what do you think*, *how many of you*.

Lexical Bundles That Incorporate Dependent Clause Fragments

This category also includes “clausal” bundles but this time the bundle is made up of fragments of certain types of clauses, such as complement clauses (mainly to-clauses or that-clauses). Five different subgroups can be distinguished in this category:

1. Personal pronoun + VP + dependent clause fragment: *I want you to*, *you might want to*;
2. Wh-clause fragments: *what I want to*, *what's going to happen*;
3. If-clause fragments: *If you want to*, *if you look at*;
4. (verb/adj.) + to-clause fragment: *to be able to*, *to come up with*;
5. That-clause fragments: *that there is a*, *that I want to*, *that this is a*.

Lexical Bundles That Incorporate Noun Phrase and Prepositional Phrase Fragments

This group comprises “phrasal” bundles, mainly noun phrases with embedded noun or prepositional phrase fragments or prepositional phrases with noun phrase or other prepositional phrase fragments embedded. Three different groups can be found within this category:

1. (connector) + noun phrase with *of* phrase fragment or other post modifiers: *one of the things*, *the end of the*, *a little bit about*, *the way in which*, and *stuff like that*;
2. prepositional phrase expressions: *of the things that*, *at the end of*, *at the same time*;
3. comparative expressions: *greater than or equal*, *as well as the*.

This structural classification has been successfully used in several studies to group four-word bundles according to their grammatical correlates. In addition, in the study of four-word lexical bundles in Spanish corpora conducted by Tracy-Ventura et al. (2007), a structural type of bundles used as “relativizers” to introduce relative clauses was identified:

a la que se (to which), en el que el/la (in which the). These bundles would have a shorter counterpart in English or in some cases only one word or a two-word collocation would be used instead.

It should be noted that lexical bundles are closely bound to the register in which they originate. The longest bundles found by Biber, et al. (1999), were six-word bundles, expressions such as *if you know what I mean* in conversation and *from the point of view of* in academic prose. Cortes (2009) identified and analyzed lexical bundles in a corpus of research article introductions from twenty academic disciplines. She found several much longer bundles, expressions such as *the purpose of the present study was* (seven-word bundle), or *the rest of the paper is organized as follows* (nine-word bundle), which were extremely frequent (more than ten times per million words) in this specialized corpus.

Functional Analysis of Lexical Bundles

As previously mentioned, lexical bundles are defined by frequency and they are often not complete units, made up of phrase or clause fragments. Perhaps one of the most salient features of lexical bundles is that, in spite of their peculiar incomplete structure, they perform definite discourse functions that need to be analyzed in order to better understand the way in which these expressions are used and their distribution across registers. Hyland (2008) identified and functionally analyzed the most frequent lexical bundles in a corpus of MA theses and doctoral dissertations. His taxonomy grouped bundles in three major foci closely connected to the registers he analyzed in his study: research-oriented, text-oriented, and audience-oriented. Biber, et al. (2004) presented a taxonomy they had been working on for several years to functionally classify lexical bundles. These authors used this taxonomy in several studies with different genres, particularly academic genres (lectures, textbooks, and research articles). Their taxonomy introduces three major categories: stance bundles, discourse organizers, and referential bundles.

Stance Bundles

Stance bundles present a frame that helps interpret the proposition following the bundle. They convey two types of meaning: epistemic and attitude/modality. Epistemic stance bundles present a commentary about the certainty of the information contained in the proposition that follows the bundle. This comment can be certain, uncertain, or probable/possible (in expressions such as *I don't know if*, or *I don't think so*). Attitudinal/modality stance bundles introduce the speaker's attitudes toward the actions or events presented in the proposition that comes after the bundle (e.g., *I want you to*, *I'm not going to*). These bundles can be used to express attitudes such as desire (*I don't want to*), obligation (*you have to do*), prediction (*is going to be*), or ability (*to be able to*). Stance bundles can be personal or impersonal. Personal stance bundles are overtly related to the speaker or writer (*I*) as in the examples presented above. In the case of impersonal stance bundles these meanings are not explicitly attributed to the speaker or writer (as in *it is possible to*, *can be used to*).

Discourse Organizing Bundles

This category of bundles performs two major discourse functions: topic introduction or focus, and topic elaboration or clarification. Those bundles performing the topic introduction/focus function are used to introduce a new topic in the discourse. For example, in the case of classroom teaching discourse, the bundles are used to announce the instructors' intention to start a new topic or to consider the topic under discussion together with their students: "before I do that, *I want to talk about Plato*" (Biber, et al., 2004, p. 142).

Those bundles used to express topic elaboration or clarification frequently occur when additional explanation is introduced as well as when a comparison and contrast is introduced. This example has been taken from a corpus of academic prose, specifically from a collection of research articles:

The symbol of a beautiful girl on an advertisement has many meanings. It shows of course how beautiful a woman is, it sells its product, and many women strive to be that. But *on the other hand* it has dark sides to it: it shows women as animals, it makes women want to be perfect, and it doesn't show how intelligent women can be.

Referential Bundles

The major function performed by these bundles is that of identifying an entity or highlighting some attribute of an entity as salient. Within this category we can find bundles that are used to single out specific attributes such as quantities or amounts (*a little bit of*), some physical characteristic of the entity (*the size of the*), or some abstract characteristics of the entity (*the nature of the*). Another frequent subcategory of referential bundles is those expressions used to refer to a particular place, time, or a location in the text in expressions such as *at the beginning of*, *at the end of*, or *as shown in figure*.

This functional classification has been used in many studies by different scholars when analyzing registers such as conversation, research articles, university textbooks, classroom teaching, academic interviews, university study groups, office hour conferences, and others (Biber, et al., 2003, 2004; Cortes, 2004; Tracy-Ventura et al., 2007; Kim, 2009). The extensive use of such a taxonomy helps assess its reliability and improves the categories, adapting or adjusting old categories, and creating new categories when new expressions are identified. Some recent studies have been trying to identify bundles in smaller discourse units to understand the functions performed by these expressions better (Cortes & Csomay, 2007; Cortes, 2009).

Pedagogical Implications

Fixed expressions have always been considered an important feature in the language production of native speakers of a language, which makes them a high proficiency target for students of that language to master. Some studies have concentrated on lexical bundles that can be taught to students as signaling devices in discourse, particularly those bundles that indicate a topic introduction or topic elaboration (Nesi & Basturkmen, 2006; Neely & Cortes, 2009). Several attempts have been made to teach lexical bundles to native and non-native speakers of English but students did not seem to obtain high gains in the production of these expressions, which are very frequently used by proficient speakers and expert writers (Jones & Haywood, 2004; Cortes, 2006). More studies are needed to investigate better ways to raise students' awareness of the functional role of these expressions in particular contexts.

Lexical Bundles and Technology

VIVIANA CORTES

The study of frequently occurring word combinations has been an important focus in the linguistic field for several decades, but it was the appearance of corpus-based methodologies and the advancement of computer technology that prompted the design of new research questions and the empirical rather than intuitive investigation of such linguistic phenomena. For example, concordancing software (i.e., computer programs that are used to search for words or expressions in a text or in a collection of texts or language corpus) makes it easy to identify the collocational tendencies of a particular word—that is, which word or words the particular word prefers to frequently occur with. For many years, the most frequent collocations or recurring word combinations in a language or particular register were identified in a rather intuitive way, producing lists of frequent expressions identified perceptually (see, for example, Pawley & Syder, 1983) or more recently, reviewing the literature for those expressions and checking their frequency in a corpus (Nattinger & DeCarrico, 1992). All in all, the varied research conducted on the study of word combinations has come a long way: from the ethnographic and qualitative studies in first and second language acquisition of formulaic routines of the 1970s (Hakuta, 1974; Gleason & Weintraub, 1976; Krashen and Scarcella, 1978; Wong Fillmore, 1979) to the quantitative corpus-based studies of natural language analysis in the 1990s (Butler, 1998; De Cock, 1998; Granger, 1998; Biber & Conrad, 1999). The study of language corpora by means of computational analysis makes it possible to empirically identify the sequences of words that most commonly occur in any language as a whole or in a group of texts in a particular register. With the use of specially designed software used in a language corpus, the identification of recurrent word combinations, such as lexical bundles, is now conducted in a more empirical way.

Lexical bundles are a special type of word combination. The term *lexical bundle* was coined by Biber, Johansson, Leech, Conrad, and Finegan in their seminal grammatical work, the *Longman Grammar of Spoken and Written English* (1999). Lexical bundles were described as “recurrent expressions, regardless of their idiomaticity, and regardless of their structural status” (p. 990). That is, lexical bundles are sequences of words that commonly go together in natural language. By definition, lexical bundles are combinations of three or more words that frequently occur in a given register. Frequency is the ultimate characteristic that defines a lexical bundle. For Biber et al. (1999), a four-word combination, for example, had to occur 10 times in a collection of texts of a million words to become a lexical bundle. Other studies worked with more conservative cutoff points in order to focus on expressions that are really frequent in a particular register (Cortes, 2002; Biber, Conrad, & Cortes, 2004). In addition, according to the definition of Biber et al., the expression has to be used in five or more texts to avoid idiosyncrasies. The way in which these expressions are identified was first used by Bent Altenberg (1993). His work deserves special mention, as he was the first one to employ innovative methodology for the identification of fixed expressions, the same methodology that was later used by Biber et al. for the identification of the now labeled lexical bundles. Altenberg’s earliest work with the London–Lund Corpus of Spoken English (about 500,000 words) reports an inventory of over 68,000 different word combinations (types) representing some 200,000 examples

(tokens). The results of his studies (Altenberg, 1990, 1993, 1998; Altenberg & Eeg-Olofsson, 1990) demonstrate the pervasive character of conventionalized language particularly in spoken discourse. Altenberg (1990) stressed the importance of formulaic structures in the creative process of language, as even the spontaneous use of language is planned, encoded, and executed in a very short time span. Altenberg explained that speakers compensate this flaw by using repetition and by recycling expressions that were previously used or stored in order to simplify the production task. Biber and Conrad (1999) built on Altenberg's studies, using the same methodology in the conversation and academic prose sections of the Longman Spoken and Written Corpus. These authors clearly stated that "lexical bundles can be regarded as lexical building blocks that tend to be used frequently by different speakers in different situations" (p. 991). They produced a comprehensive list of four, five, and six-word lexical bundles in everyday conversation and in academic prose, and grouped these expressions according to their grammatical correlates. In general, they found out that conversation makes more use of lexical bundles than academic prose, which is somewhat logical, as conversation has frequently been considered extremely formulaic. Biber et al. (1999) stated that "some scholars have suggested that most conversational utterances are composed of relatively fixed lexical bundles" (p. 996). Some examples of lexical bundles in conversation, for example, are expressions such as *I don't know what, I said to him, don't worry about it, that's what I mean*, while in academic prose, frequent lexical bundles are expressions like *as a result of the, on the other hand, and in the context of, to mention just a few*.

Lexical Bundles Identification Process

The reason why the identification of lexical bundles has been regarded as empirical, in contrast to other more intuitive ways of identifying recurrent fixed expressions, derives from the methodology used. When researchers approach corpora in search of lexical bundles, they do so without any intuition or perception. In fact, researchers do not know which expressions are going to turn into lexical bundles until the program finishes processing all the texts in the corpus and yields the results. These results consist of those fixed combinations that meet the previously determined cutoff point, usually calculated as a certain number of times in a million words and a certain number of texts in the corpus (e.g., occurring ten, twenty, or forty times in a million words and appearing in five or more texts in the corpus, that is, used by five or more speakers or writers).

A program designed to identify lexical bundles works on the same basis as one that identifies word n-grams, groups of n-number of words, but they need to compile to the cutoff points for total occurrences and for number of texts. For example, the Lexical Bundle Program or LBP, was first designed using Borland Delphi software and Pascal programming language to look for four-word lexical bundles (Cortes, 2002, 2004). This program starts reading the first word of the first text in a given corpus and, moving one word at a time, takes all the four-word combinations in that corpus and stores them in a database until the last four words of the last text in the corpus have been processed. Thus, for example, if the first sentence of the first text starts with "The study of frequent word combinations . . ." the LBP will take *the+study+of+frequent* and will store this expression in the database. Then, moving one word at a time, it will go on processing *study+of+frequent+word, of+frequent+word+combinations*, and so on, storing in this case each four-word combination in the specially created database. As soon as a word combination is identified, the program surveys the database (which stores the expressions alphabetically) in order to check whether the expression is already there. If this is the case, the program keeps count of the repeated expressions and it flags the texts in which the expression has been used, keeping count of

Figure 1 Screenshot of the Lexical Bundle Program (LBP) database

the number of texts in which the expression occurred. After all the words in the corpus have been processed, the program identifies all those expressions that meet the previously established cutoff point and transfers them to another database or a special file created to store or analyze these data.

When lexical bundles are identified, the units that make up the bundle are orthographic word units, although these units combine separate words, as in the case of contractions, which are extremely frequent in spoken genres. For example, compound words or contractions such as *self-control* or *don't* are considered single words in the analysis of lexical bundles. When the LBP, for example, comes across a punctuation mark, it immediately stops and starts processing the text again after the punctuation mark. Biber, Conrad and Cortes (2003) state that only uninterrupted strings of words are processed as lexical bundles.

Figure 1 shows a snapshot of the LBP database. In this snapshot, we can see the database that holds all the four-word combinations that the LBP yielded from a corpus of research article introductions. The frequency column shows that only one expression met the cutoff point (in this particular case, 20 times per million words and 5 or more texts) to become a lexical bundle: *as a result of*, which occurred 70 times and in 65 texts in this corpus. This expression is then transferred to an output file that contains what have now become lexical bundles (four-word combinations that met the cutoff points for overall frequency and number of texts), arranged in alphabetical order. The advantage of having the output in a text file is that the data can be easily transferred to any database and sorted in any way (ascending/descending total frequency, alphabetically, ascending/descending number of texts, etc.).

Some commercially available computer software such as WordSmith Tools (Scott, 2008) and Collocate (Barlow, 2004) can also identify lexical bundles following a similar procedure and providing complementary statistics on collocational frequencies. The free downloadable software AntConc (Anthony, 2006) or N-gram Phrase Extractor, part of the Compleat Lexical Tutor (Cobb, *n.d.*), can identify n-grams (any combination of n-number of words) but they do not provide a count for the number of texts in which those word combinations occur. Ari (2006) presents a review of three software applications that can be used to identify recurrent word combinations, although some of them cannot be used to identify lexical bundles.

Corpus Size and Lexical Bundles

As previously explained, lexical bundles are defined by frequency, and the original study of lexical bundles presented by Biber et al. (1999) established their cutoff point as ten times in a million words. This is an important consideration to bear in mind when working with small corpora or corpora of different sizes. As lexical bundles' ultimate condition is frequency it is essential to make sure that these expressions are frequent in a given corpus. The normalization formula that is frequently used in corpus-based studies has presented several difficulties to researchers working with small corpora. For example, if by definition a combination of four words has to occur ten times in a corpus of one million words to become a lexical bundle, every four-word combination identified in a corpus of 100,000 would become, after normalization to a million words, a lexical bundle [normalization formula: (number of tokens/number of words in a corpus) * normalized number [one million in this case]: $1/100,000 * 1,000,000 = 10$). It is not difficult to discover that the frequency of these four-word combinations identified in small corpora does not increase in such an expected way because not all four-word combinations become bundles. Thus, it is very important to be conservative with the designated cutoff points when working with corpora smaller than one million words to ensure a reliable analysis. Ideally, one-million-word corpora should be the threshold for the identification of these expressions.

Grammatical and Functional Classification of Lexical Bundles

Despite the fact that lexical bundles are frequently not structurally complete units, they do have strong grammatical correlates which help with their structural classification. Biber et al. (1999) provided an exhaustive list of four-, five-, and six-word lexical bundles and classified them according to several basic structural types. In conversation, 90% of the lexical bundles are segments of declarative or interrogative clauses, expressions such as *I don't know why*, *thank you very much*, *I know what you mean*, while 60% of the bundles identified in academic prose are fragments of noun phrases or prepositional phrases, for example *the end of the*, or *in the context of the*. Biber and Conrad (1999) discovered that most frequent bundles in conversation were found to mark personal stance, expressing feelings, thoughts, or desires, while the most frequent lexical bundles in academic prose expressed abstract or logical relations. Their first attempt at classifying bundles functionally was further developed by Cortes (2002), who created a taxonomy to classify bundles recurring in conversation and academic prose. This taxonomy was later improved by Biber, Conrad, and Cortes (2003, 2004) and its reliability was tried out in varied corpora (research articles from various disciplines, university textbooks, and university lectures) finding a strong agreement across registers. At the same time, Culpeper and Kytö (2002) produced a functional classification for the three-word lexical bundles that they had identified in their corpus of Early Modern English. Most bundles used in conversation convey stance, that

is they express modality, attitudes, emotions, and value judgments (in expressions such as *I don't think so, I would like to*) or they are used as interaction markers to organize interactions in conversation (e.g., *I tell you what, or something like that*). Lexical bundles used in the academic registers are often referential, making direct reference to the physical, temporal, and textual context (such as *at the end of, at the beginning of, or at the time of*) or text organizers, used to identify a logical relationship between a prior discourse segment and the subsequent discourse (as in *in this chapter we, on the one hand, or on the other hand*).

Final Remarks

The corpus-based and technology-originated approach facilitates the identification of expressions like lexical bundles, which would have been unidentified otherwise. Researchers interested in lexical bundles suggest that frequent word patterns do not occur by accident and do require further analysis in various textual contexts to determine whether these expressions are undoubtedly building blocks of discourse strongly associated with diverse communicative functions.

Lexical Collocations

ANDY BARFIELD

In general terms, lexical collocations are multiword units, consisting of two or more words that constitute a whole unit of meaning and which particular discourse communities repeatedly use in spoken and written communication. Their status as conventionalized and recurrent phrases makes lexical collocations a central means by which individual language users create meaning, maintain fluency and produce a quality of appropriate naturalness in their language use. There are, however, markedly different ways of conceptualizing and defining lexical collocations in more specific terms. This entry will limit itself to two in particular, the phraseological and the textual. The phraseological school of thought tends to consider lexical collocations in compositional terms and to focus on the lexical, syntactic, and semantic restrictions that they are subject to. In contrast, the textual school tends to see lexical collocations as two or more words that co-occur in text within a short distance of each other, and this approach uses corpus evidence as the primary criterion by which to identify relevant cases.

The Phraseological View of Lexical Collocations

The phraseological view is used here to cover different pedagogically oriented positions and linguistic typologies from the last 80 years or so. The phraseological school has a very strong pedagogic agenda, and its diverse theorizations are often directed toward how best to explain lexical collocations to second language learners and users so that they may correctly encode them. One particular typology of collocation within the phraseological tradition explicitly distinguishes “grammatical collocations” from “lexical collocations” (Benson, 1985). According to Benson, in a grammatical collocation, a dominant word (noun, adjective, or verb) is combined with a preposition or grammatical structure such as Noun + Preposition, Noun + *to* + Infinitive, Adjective + Preposition. The seven main categories of lexical collocation represent word combinations consisting of nouns, adjectives, verbs, and adverbs only, but without any function words (Verb + Noun, Adj + Noun, Noun + Verb, Adj + Adv and Verb + Adv). This categorization by word class largely determines the design of a major collocations dictionary known as the BBI (Benson, Benson, & Ilson, 1997), although the BBI also uses semantic macro-labels (drawn from Mel’čuk’s work on lexical functions; see further below) for classifying particular verb–noun collocations. Other connections can also be made here to the difference between “colligation” and “collocation” (proposed by Firth in the textual view of lexical collocations and later developed by Sinclair, among others; see further below).

The phraseological school is rooted in work carried out in Russia from the late 1940s onwards, but links between a phraseological view of collocation and structuralist linguistics—e.g., Saussure’s view that language use creates syntagmatic solidarities between two or more sequential units—informed the pioneering work of Bally and Palmer in the early 20th century. Bally worked on phrase-based French learning materials for foreign students at Geneva University in 1909 (Barfield & Gyllstad, 2009, pp. 17–18), whereas Palmer collaborated with Hornby to categorize and codify the lists of collocations they had created for the development of English language materials in prewar Japan (Cowie, 1999,

2 LEXICAL COLLOCATIONS

pp. 52–81). Palmer (1933) classified collocations into three types: “abnormal collocations” (where the meaning of the collocation cannot be deduced from its parts); “semi-normal collocations” (collocations which can be immediately understood if the more particular senses of the component words are known); and “normal collocations” (or immediately comprehensible collocations). This tripartite division directly foreshadows later more theoretical classifications of “free combinations,” “restricted collocations,” and “idioms” in the phraseological school. Other theories to do with the compositionality of multiword units were elaborated by Vinogradov and Amosova in the Soviet Union from the late 1940s to the 1960s and were taken up in the West from the 1970s onwards (Cowie, 1998a, pp. 213–18).

One major classification comes from Mel’čuk’s work on lexical functions. Mel’čuk (1998) puts forward a set of conditions by which semantic phrasemes (i.e., collocations) can be categorized and described in terms of their lexical function. According to Mel’čuk, a lexical function (LF) represents a general abstract semantic notion, and particular LFs can be related to different lexical units and are lexically realized in different surface forms. The LF Oper represents the notion of “doing or carrying out,” for instance, and can be realized as *launch* in *launch an appeal* and *pay* in *pay a visit*. Both of these collocations have two constituent lexemes, *launch* + *appeal* and *pay* + *visit*, hence they are classified as two-word collocations. In these surface two-word collocations, one freely chosen constituent lexeme retains its literal sense (in these examples, *appeal* and *visit*), whereas the other constituent is restrictedly chosen (*launch* and *pay*) because it is contingent on the first element. Thus, the freely chosen “argument” *appeal* motivates the restricted selection of *launch*. A different influential theorization comes from Cowie who sees lexical collocations as composite units of two lexemes occurring in a specific range of grammatical constructions where at least one of the elements is substitutable and is used in a figurative or specialized sense, as with the verb *explode* in combinations like *explode a myth*, *explode a belief*, *explode an idea*, *explode a notion*, and *explode a theory* (Cowie, 1981). Cowie (1981), Howarth (1998) and Nesselhauf (2003) all present the case for a scalar analysis of word combination categories ranging along a continuum from transparent, freely recombinable combinations at one end to unmotivated and formally invariable idioms at the other. Howarth (1998), for example, refers to “free combinations” (*blow a trumpet*), “restricted collocations” (*blow a fuse*), “figurative idioms” (*blow your own trumpet*), and “pure idioms” (*blow the gaff*), and identifies restricted collocations as the most challenging type for second language learners.

Restricted (lexical) collocations constitute a vast array of composites which are variable to an arbitrary and limited extent in that they are open to a limited number of lexical choices at one or two points, e.g., *have/feel/experience a need* [for NP] and *find/experience trouble/difficulty in DOING NP* (Cowie & Howarth, 1996, p. 83). Part of the difficulty that they pose lies in the fact that sets of nouns and verbs in restricted verb–noun lexical collocations may overlap in their intercollocability, or “collocation ranges,” and create similar but not identical “clusters” of combinable verbs and nouns. Compare:

- (1) *convey/express/communicate/get across point/argument/view/opinion/message*
- (2) *convey/express regrets/condolences*
- (3) **communicate/*get across regret/condolences*. (Cowie & Howarth, 1996, p. 84)

Mis-collocations such as **communicate/*get across regret/condolences* are termed “collocation blends.” Phraseologically competent users, within this view, know the restrictions in such overlaps; less phraseologically proficient users may not always recognize such arbitrary blockages and, as a result, produce collocation blends.

The Textual View of Lexical Collocations

Concepts central to the textual view of lexical collocations come from Firth, Halliday, and Sinclair, and in particular were elaborated by Sinclair over a 40-year period. The textual view addresses lexical collocations from a functional point of view and considers them in terms of the phrasal choices that the language user has for achieving meaning. Insights are derived from data-driven analysis of language in naturally occurring contexts of use.

Firth employed the term “colligation” for the structural relationships between the formal categories of the words used in particular collocations (such as Adj + N for *dark night*), and one of his major proposals was that words have habitual companies that they keep, through which their meaning is partially shown: part of the meaning of *night* lies in its co-occurrence with *dark*, and part of the meaning of *dark* in its co-occurrence with *night*, too (Firth, 1957, p. 196). Firth’s emphasis here is on the individual word rather than the collocation itself as a unit of meaning, but much of the subsequent work of the textual school shifts to a phrase-based view of collocation and examines what this implies for a theory of language use.

As with the phraseological school, a major assumption of the textual approach is that collocation restricts the co-occurrence of particular lexical items. However, to identify such restrictions, the textual school is interested in items that co-occur “with a probability greater than chance” (Halliday, 1966). It was Sinclair who started to identify and test through empirical research the basic operational criteria by which to do this. Sinclair proposed the “node” as the fixed variable (i.e., the lexical item whose collocation environments are under examination) and argued that the “span” of the node (the number of other lexical items co-occurring before and after the node) should be varied until it could be fixed “at the optimum value” (Sinclair, 1966, p. 415). Such an analysis allows a “cluster” to be identified (i.e., a set of typical collocates derived from all the collocates that co-occur with the node), where the “range” of a cluster indicates the probability of items within a cluster inter-collocating with each other. Sinclair also drew an important difference between “casual collocation” (i.e., chance) and “significant collocation” (i.e., typical and repeated) and proposed a basic formula for predicting the probability of two lexical items collocating with each other in a particular text.

An early study led by Sinclair (Sinclair, Jones, & Daley, 1970) showed how the optimum span came to be empirically set at $\pm$ four words right and left of the node. It also revealed how the more frequent a lexical item, the less lexical it will be, and vice versa. Highly frequent lexical items are more grammatical/less lexical and therefore bound to certain positions in collocation patterns, whereas less frequent items have greater positional freedom. A later groundbreaking project, the Collins Birmingham University International Language Database (COBUILD), involved the establishment of a computerized corpus of English and the production of the first learner dictionary based on automated, corpus-based concordance analysis of lexical items and their habitual collocation environments (*Collins COBUILD English Language Dictionary*, 1987). The corpus data yielded a wealth of insights into how common words in English collocate with each other. It was found that the most frequent words of English tend to be collocated in delexical senses rather than in a full lexical sense so that they perform as elements of structure. The project also revealed that the different senses of lexical items have such constrained typical phrasal patternings that few frequent words could be thought “to have a residue of patterning that can be used independently” (Sinclair, 1987b, p. 158). Undoubtedly, the most far-reaching result of the COBUILD project was the overriding sense of “the replacement of words by phrases” (Sinclair, 1987b, p. 150) in the real-world use of English.

More recent work in the textual approach has focused on the concepts of “semantic prosody” and “semantic preference,” and their interrelationship with colligation and collocation. Semantic prosody refers to how there is a positive, negative, or neutral connotation between a word and its collocates. The noun *cause* has a negative semantic prosody, with its collocates including *accident*, *concern*, *damage*, and *death*, whereas *provide* has a positive semantic profile and tends to co-occur with *care*, *food*, *help*, and *money* (Stubbs, 1995). Sinclair (2004) shows how *place* (used informally as in *come back to my place*) has a semantic prosody of “informal invitation” (as in *would you like to come back to my place*), and a tendency to co-occur with (or semantic preference for) the possessive adjective “my” (*my place*) and other items meaning “local travel.” This is achieved by colligations with verbs of movement (such as *come*), adverbs of place (such as *back*, *home*, *over*) and the preposition *to* (*come back to my place*). Other recent analyses are beginning to examine “long-distance collocations” (Siepmann, 2005) and the powerful role that lexical collocations play in producing meaning beyond clause boundaries and across stretches of discourse.

This shift to a holistic phrase-based view of collocation blurs the boundaries between grammar and lexis as separate language systems and leads to the concept of lexicogrammar. It also results in the theoretical position that two different principles of interpretation are needed to explain adequately how multiword units such as lexical collocations work in discourse. The “open choice principle” refers to a paradigmatic mode of text construction that involves a series of open-ended choices about what is to be slotted and filled in between completed units such as a word, collocation, phrase or clause. The “idiom principle,” on the other hand, refers to the syntagmatic axis and the contextually constrained set of “semi-preconstructed phrases that constitute single choices” (Sinclair, 1987a, p. 320) that a speaker or writer can draw on to textualize meaning in ongoing text construction. Thus, lexical collocations, in these terms of reference, pervade discourse and are central to the achievement of appropriate naturalness in language use.

Lexical Erosion

NANCY C. DORIAN

Lexical Reduction in Normal Language Change

Lexical erosion refers to reduction and loss in the lexical resources of a language. A certain amount of lexical loss is a normal feature of language change, especially when changes in lifeways or technology result in the abandonment of some traditional occupations, pastimes, or earlier technologies. In English, for example, the terminology of falconry, once widely in use, is known today only to historians and avocational falconers. Equally unfamiliar today are the precise distinctions among the many types of horse-drawn vehicles prominent in English life before the introduction of the automobile. Under particularly negative circumstances, however, lexical loss can be accelerated in a language with a contracting speaker base, to the point where it reduces the full and distinctive range of expression originally offered by the language.

Lexical Reduction in Language Shift

Extensive lexical loss is faced, for example, by minority-language communities in which shift to some other language has begun. Traditional lifeways in such communities are often disrupted by sharp changes in the overall environment brought about by developments such as resource depletion, land takeovers, government-sponsored in-migration, and gradual urbanization. Where these circumstances prevail, livelihoods that were once universal may no longer be viable, or even available, for minority-language speakers. Vocabulary related to traditional subsistence modes and occupations then becomes obsolete and falls out of use. If changes in lifeways are extreme, lexical loss will be correspondingly high.

Lexical Loss Through Incomplete Language Transmission and Disuse

In minority-language communities with a small population base, interruption of normal language transmission processes poses a particularly serious risk to lexical maintenance. There are only some 200 countries in the world, but there are perhaps 6,000 or 7,000 languages in use around the globe. It is clear, therefore, that most languages are not the official language of the countries in which they are spoken. These nonofficial languages are in competition with better-established and more widely spoken languages that enjoy official-language standing. Institutional support (use in government and schooling, for example) confers prestige on official languages while also making their acquisition economically advantageous. As a result, such favored languages expand by acquiring new speakers, while smaller, unofficial languages tend to contract and lose speakers. As the contraction process proceeds, reduced exposure to the traditional language produces a drop in proficiency among younger people. Lexical erosion is one prominent manifestation

of this development, as new speakers fail to acquire the fuller vocabularies that were in use among their parents and grandparents.

Assessing Lexical Loss

Various techniques have been used to gauge the degree of lexical loss in nonofficial languages with contracting speaker populations. One approach is to ask speakers of various ages to supply the words in their traditional language for “core” vocabulary items, a term applied to words taken to be so universal to human experience that they are present in the lexicon of nearly every language. Larger and smaller sets of such core words were developed in the 1950s and 1960s and used originally in assessing degrees of chronological separation between related languages (e.g., Swadesh, 1952).

Gaelic lexical retention was assessed by Dorian (1981) via core-vocabulary testing. In a shrinking bilingual community speaking an unwritten and obsolescent variety of Scottish Gaelic in addition to English, a 220-word core English vocabulary list was presented for translation into Gaelic. The 14 bilinguals tested were distributed over an age range of 40 years (ages 74 to 34) and were all participants in a broader study of Gaelic proficiency. Their East Sutherland Gaelic-speaking communities had lost the fishing industry that had sustained both livelihood and language, and no one under 30 years of age had acquired Gaelic. Across the bilingual population in general, in ordinary conversation and in elicitation aimed at exploring grammatical control, age correlated with Gaelic proficiency in that the eldest community members showed greater grammatical and lexical knowledge than the younger speakers. In the decontextualized testing of core vocabulary retention in particular, lexical production accorded well with age in one respect but poorly in another. On the one hand, all of the older and fully fluent speakers produced more Gaelic lexical items than any of the imperfect younger speakers at the low end of the age range. On the other hand, some of the very high-proficiency older speakers found it difficult to produce individual lexical items in isolation and were outperformed by fluent speakers of a younger age.

In another approach to the question of lexical retention and loss, Jones (2001) chose 10 semantic fields and tested bilingual speakers’ ability to produce lexical items representing each field in Jërriais, the traditional but receding Norman French variety spoken on the island of Jersey in the English Channel. As in the Gaelic-speaking communities of eastern Sutherland, the local language was obsolescent at the time of the study; it was rare to find a speaker under the age of 40. All of the speakers tested by Jones were fluent in Jërriais, however, and her interest lay in determining whether some semantic domains were losing lexical ground more swiftly than others. Since earlier records of Jërriais lexicon were available in the form of a Jersey French/standard French dictionary (Le Maistre, 1966), Jones was able to compare her interview results from the late 1990s with lexical findings from more than a generation earlier. She found lexical retention highest in very familiar spheres of activity (e.g., the weather, the house, the family, the body, animals and insects), but somewhat lower in certain other equally familiar-seeming spheres (e.g., illnesses, flora, birds). There was again some indication of retrieval difficulties due to the decontextualization of the testing procedure.

Immigrants cut off from full access to their original mother tongue face lexical retrieval problems similar to those of indigenous minority-language speakers, since both populations experience reduced exposure to the language of their community of origin. One study of first language lexical retention after emigration tested a sample of American immigrants each of whom had resided in Israel for at least eight years. Each was asked to provide an English-language narrative for a children’s picture book with a richly illustrated story

line but without any accompanying text. Their results were compared with those produced in response to the same task by a monolingual English-speaking sample in the USA. The immigrant sample residing in Israel showed signs of reduced access to their first language lexical resources, substituting semantically imprecise or unspecific words for the more precise terms used by native speakers still in the country of origin (Olshtain & Barzilay, 1991).

Lexical Persistence Beyond Language Shift

Despite the vulnerability of lexicon during the language shift process, fragmented but surprisingly strong lexical knowledge may survive beyond regular use of the contracting language. A 15th subject in Dorian's core vocabulary testing for East Sutherland Gaelic was a bilingual in his early thirties whose knowledge of Gaelic was almost entirely passive (Dorian, 1981, p. 146). His receptive knowledge of Gaelic was excellent, but he demonstrated very little productive control of the language. Despite his limited productive skills, he nevertheless produced 150 of the 220 core vocabulary items, demonstrating that considerable lexical knowledge of an obsolescent language can persist beyond active use of the language and that lexical material may be retrievable even after community members have ceased to make active use of the local language. In his very brief report on research among the four Mohican Indians who could still remember a little of their ancestral language in 1938, Swadesh noted the same finding: although none of the four individuals was then able to speak connected Mohican, all were able to provide isolated words and set phrases. Lexical persistence was particularly striking in this case, since the Mohicans had been displaced not once but twice, first from Massachusetts to western New York and then from New York to Wisconsin (Swadesh, 1948). Evidently documentary linguistic fieldwork may still remain worthwhile even when there are no longer any regular speakers.

In communities where language shift and lexical loss are under way, speakers who continue to use the traditional local language for relatively limited purposes resort to various means of stretching their lexical resources to compensate for reductions produced by disuse and incomplete transmission. Borrowing from the expanding official language of the region is the commonest compensatory strategy, but the phenomenon is viewed very differently from one minority-language community to another. On the island of Jersey, for example, Jones reported that the use of borrowings from English was not stigmatized and that some borrowings had become integrated enough into Jèrriais to function as synonyms for indigenous Jèrriais terms (Jones, 2001, p. 121). In East Sutherland, even though borrowing from English was likewise extremely frequent, the use of English words and phrases when their Gaelic counterparts were well known was by contrast a stigmatized behavior (Dorian, 2010, pp. 96–8). In Gaelic conversations among local people, high levels of borrowing passed without comment, but self-consciousness about gratuitous borrowing and disapproval of the practice emerged quickly in the presence of speakers of other forms of Gaelic. Local speakers tried to reduce their use of borrowings under those circumstances.

In some minority-language communities where there has been a centuries-long history of intense contact with another language, borrowing may become so extensive as to incorporate not just such commonly absorbed elements as nouns, verbs, and adjectives but also connective particles, conjunctions, prepositions, and exclamations, as was reported for the Nahuatl (Mexicano) of the Malinche area of Mexico. What passed for speaking Mexicano in that region permitted the incorporation into Mexicano of almost any Spanish form at all (Hill & Hill, 1986, p. 156). The presence of so much Spanish material in the unrelated local indigenous language was the focus of much puristic censure, making the language appear less authentically indigenous to its own potential speakers and so possibly working against its survival in that part of Mexico (Hill & Hill, 1986, pp. 98–9, 140–1).

Alternatively, intense contact over many centuries may produce forms of speech in which identification of distinct lexical and morphological elements from one or the other of the two languages becomes an impossibility. This is reported to have happened in extreme northwest Russia, where several blended forms of Karelian and the local (non-standard) dialect of Russian prevailed in the late Soviet period, showing various degrees of convergence on the phonological, morphological, and syntactic levels in spite of the fact that the two languages are unrelated. Close investigation of this phenomenon persuaded the investigator to recognize three different forms of merged Karelian and Northwest Russian, from least merged “Neo-Karelian” to most merged “Karussian” (Sarhimaa, 1999, pp. 306–8).

Apart from the borrowing of vocabulary from another language in the local environment, several other strategies have been identified among speakers who have not acquired the full lexical resources of their community’s traditional language. They include topic avoidance (not talking about subjects that strain the speaker’s lexical resources), circumlocution and paraphrasing (finding roundabout ways of expressing a concept for which the speaker lacks the conventional term), and substitution of a word semantically similar to the one that the topic requires but less specific than that term (for example, using a generic term such as “water” for a more specific term such as “pond” or “stream”) (Holloway, 1997, pp. 50–4). Lexically limited speakers may also extend the semantic range of one word to cover meanings that were previously expressed by two different words, one of which is now passing out of use.

Limited-lexicon speakers of contracting languages often show considerable ingenuity in compensating for shortfalls in vocabulary, using all of the verbal strategies mentioned and drawing as well on enhanced body language and facial expression. Literate speakers of standard languages may furthermore be inclined to overestimate the importance of a large vocabulary to verbal expressiveness. It does not require a large vocabulary to speak effectively, as experience with gifted speakers of obsolescent low-lexicon languages readily demonstrates, and erudite speakers with large vocabularies are by no means reliably effective verbal performers, as is often inadvertently demonstrated in academic life.

Lexical Frequency Profiles

BATIA LAUFER

How do we know that people use rich and sophisticated vocabulary in their writing? Laufer and Nation (1995) proposed that the vocabulary richness of a text could be measured by a quantitative index called the lexical frequency profile (LFP) which uses the proportion of frequent versus nonfrequent vocabulary in the text. The index can be calculated by a special computer program, Range, available on Paul Nation's homepage (<http://www.victoria.ac.nz/lals/staff/paul-nation.aspx>) and on Tom Cobb's Web site (<http://lextutor.ca>). The program matches vocabulary frequency lists with the text you want to analyze. Any piece of writing can be pasted onto the profiler and a profile is generated in seconds. The first "classical" profiler analyzed texts into the first 1,000 most frequent words, the second 1,000, the Academic Word List—570 most frequently occurring words in academic tests (Coxhead, 2000) and "off list" words. Consider, for example, a text which consists of 200 words. Of these, 150 belong to the first 1,000 most frequent words, 20 to the second 1,000 most frequent words, 20 to the Academic Word List, and 10 are not in any list. If we convert these numbers into percentages out of the total of 200 words, the lexical profile of the text is 75%–10%–10%–5%. The output of the Range program shows percentages of word tokens, as in the above example, and also percentages of word types, that is, different words in the composition, and for word families. A word family is defined as the base word, its inflections and its most common derivations, for example, *avoid*, *avoids*, *avoided*, *avoiding*, *avoidance*, *avoidable*, *unavoidable*. The profile above can be condensed into the percentage of basic 2,000 words, that is, the sum of scores in the first two lists and the percentage of the beyond 2,000 words, that is, the sum of scores on the Academic Word List and "off list" (Laufer, 1995). In the above example, the "beyond 2,000" score is 15% (10 + 5). This means that 15% of the text consists of words not included in the 2,000 most frequent vocabulary. The profiler was originally used to check the lexical difficulty of a text L2 learners were assigned to read. The basic assumption was that a large number of infrequent words would make a text more difficult to understand. The profile which shows text difficulty best is the profile expressed in word tokens since repeated occurrences of the same unfamiliar word contribute to comprehension difficulty. However, Laufer and Nation (1995) suggested that the profiler could also measure the quality of lexis in the writing of second language learners. The profile of learners' writing is expressed in types since repeated occurrences of the same word do not show a larger vocabulary than a single use of the same word. They refer to the measure as the LFP. They found that the LFP was stable for compositions written by the same students on different topics, as long as these were of a general nature and did not involve infrequently used jargon words. They also found that the profile discriminated between learners of different language proficiencies. More advanced learners could use a higher percentage of infrequent vocabulary than learners of lower proficiencies.

To perform the LFP analysis, the original compositions written by learners are modified as follows: spelling errors that do not distort the word are corrected in order to make the word recognizable by computer and words that are semantically incorrect (e.g., wrong meaning, wrong collocation) are omitted since they cannot be regarded as known by the learners. Proper nouns that appear in the text are recoded by the program to appear in K1 words. Nowadays, a more detailed lexical profile can be performed using the Range

2 LEXICAL FREQUENCY PROFILES

program on Nation's site or VocabProfile BNC 20 on Cobb's site. The text is matched against 20 frequency lists which were developed on the basis of the British National Corpus (BNC). The resulting analysis shows the number and the percentage of words at each 1,000 of the 20 lists of 20 thousands words. Cobb added a feature which is of a particular relevance to French speaking learners of English: the percentage of English–French cognates. The site also offers a profiler for French texts.

The LFP is basically a measure of lexical *use* in writing, which can be distinguished from lexical *knowledge*. Knowledge is taken to be the information about a word which is stored and interconnected in the mental lexicon, for example, the spoken and written form, grammatical properties, different meanings, and connections with other words. Use, on the other hand, is the choice of speakers or writers to put their lexical knowledge into practice. In particular, use should be distinguished from active knowledge. Active knowledge is associated with speaking and writing and implies that we can retrieve the appropriate spoken or written word form when prompted to do so. For example, when asked to translate an L1 word into L2, we are asked to demonstrate our active knowledge. Use, however, has to do with producing words at one's free will, as is the case of a composition. It is desirable to distinguish between active knowledge and use since not all learners who produce infrequent vocabulary when forced to do so will also produce it when left to their own selection of words, as in the case of writing letters, reports, compositions, or when giving oral presentations.

Thus, LFP is one of the quantitative measures of lexical proficiency. There are additional quantitative measures that test other aspects of lexical proficiency: passive vocabulary size, for example, Nation and Beglar (2007), active vocabulary size, for example, Laufer and Nation (1999), both passive and active (Laufer & Goldstein, 2004; Laufer, Elder, Hill, & Congdon, 2004), and speed of meaning recognition (Laufer & Nation, 2001). As mentioned earlier, the LFP can be condensed into two scores, the percentage of the most frequent 2,000 words and a "beyond 2,000" score showing the percentage of words that do not belong to the most frequent 2,000 words. The single "beyond 2,000" score can be used in statistical calculations, like correlations with other measures of lexical proficiency. Together, these various measures can provide the researcher with quite a comprehensive picture of the learner's lexis. For example, Laufer (1998) studied the development of passive vocabulary knowledge, active knowledge, and use over one year of study of English as a foreign language in high school. The results showed that the three areas of lexical competence did not develop at the same pace. To put it differently, learners who have increased their passive or active knowledge by 500 or 1,000 words may not necessarily choose to *use* these words in their free writing. Non-use is often related to lack of confidence about certain features of the avoided words. A learner may not be sure whether *launch* in *launch a project* is appropriate, and, therefore, settle for *start*, which is "simpler" since it is less specific than *launch* and fits more contexts. Another reason for non-use may be connected with speed of access. When pressed for time in speech, or in writing, the first word accessed will most probably be *start* which is more frequent in language than *launch*.

Horst and Collins (2006) studied the lexical development of French speaking learners of English. Using the English–French cognate measure of the LFP, they demonstrated that learners of higher proficiency used fewer French cognates. East (2005) used the LFP to investigate the contribution of a bilingual dictionary to writing. He compared two compositions by the same learners. One composition was written with a dictionary, the other without. The lexical profiles of the two sets of composition were significantly different. This showed that the use of a dictionary contributed to the quality of learners' lexis in writing. Some other examples of using LFP in research are: tracing the lexical development of Polish speaking learners (Lenko-Szymanska, 2002), comparing L2 oral French of learners at different proficiency levels (Ovtcharov, Cobb, & Halter, 2006), comparing learners'

lexical richness in English and non-English speaking contexts (Laufer & Paribakht, 1998), predicting the academic performance of TESL trainees (Morris & Cobb, 2004), and measuring improvement in the lexical frequency profile over time (Laufer, 1994).

Another profile of lexis is P_Lex developed by Paul Meara and available for use online (<http://www.lognostics.co.uk/tools/index.htm>). The profile is similar to the LFP in its underlying assumptions, which are that people with more proficient vocabulary will use a large proportion of infrequent words, and that a valid measure of lexical production, therefore, should examine the quantity of infrequent words in a text. However, it is different from the LFP in several respects. Infrequent vocabulary is considered vocabulary that is not in the first most common 1,000 words. The analysis is performed by dividing a text into segments of 10 words each, calculating the number of beyond 1,000 words for each segment and turning these data into a single figure known as the lambda. A higher lambda indicates a higher proportion of infrequent words (for the mathematics of calculating the lambda, see Meara & Bell, 2001). P_Lex is also claimed to work well with shorter texts than those suggested for the LFP analysis, that is, texts shorter than 200 words. Miralpeix (2007) used both profiles in her analysis of oral and written English as L2 of Catalan/Spanish bilingual students to investigate what effect the age of onset of learning and the amount of exposure had on the lexis of L2 learners. She found that the lexis of early starters and late starters was very similar on both measures.

There are two major shortcomings of lexical profiles. First, they do not distinguish between homonyms (words with unrelated meanings, e.g., "bank," "pupil") and yet different meanings may belong to different frequency bands. Second, the profiles do not "recognize" multi-word units such as "as a matter of fact," "of course," "make up one's mind." Instead of listing them as single units, the profilers decompose them into separate words, for example, "of" and "course." Cobb is currently working on some solutions to the first problem and Laufer on solutions to the second problem.

Lexical Gaps

MAARTEN JANSSEN

Introduction

When talking about words, linguists mostly focus on those words that are an established part of the vocabulary. However, in some cases it is useful to refer to the words that are *not* part of the vocabulary: the nonexistent words. Instead of referring to nonexistent words, it is common to speak about *lexical gaps*, since the nonexistent words are indications of “holes” in the lexicon of the language that could be filled.

Lexical gaps have never been a main topic of research, but the notion of a nonexistent word relates to so many different topics that over the years a significant amount of work has been published on lexical gaps. Since these publications come from a large array of different linguistic fields, the terminology is not always well established. This entry will first present a brief overview of the different types of lexical gaps and then discuss some linguistic issues related to lexical gaps.

A Topology of Lexical Gaps

The study of lexical gaps starts with the work by Chomsky (1965) and Chomsky and Halle (1965). They distinguish between, on the one hand, *accidental gaps*, which are words that do not exist but could be reasonably expected to exist, and, on the other hand, *systematic gaps*, which are words that are not even expected to exist since they violate the rules of what a “good” word is. In much of the subsequent work, however, the term *lexical gap* is reserved only for the accidental gaps.

The accidental gaps in the work of Chomsky and Halle are segments or strings of letters that could possibly form words. Such gaps will here be called *formal gaps*, sometimes also referred to as *morpheme gaps*. A significant part of the more recent work on lexical gaps, however, deals with *semantic gaps*, sometimes also called *functional gaps*, in other words “the lack of a convenient word to express what [the speaker] wants to speak about” (Lehrer, 1974, p. 105), although words that are possible but not (yet) considered convenient are also considered semantic gaps. A semantic gap is a notion for which there is no word, whereas formal gaps are “words” that do not refer (to any notion). As with formal gaps, we can in principle distinguish between semantic gaps that are accidental, and semantic notions for which no word can exist because they violate the rules of what a “good” notion is (for lexicalization).

The class of nonexistent words can hence be divided into four different classes as shown in Table 1, where a *lexical gap* is typically reserved for the left column only: either a formal or a semantic accidental gap. The remainder of this section provides a more detailed description of these two types of lexical gaps.

Formal Gaps

The orthographic rules and the vocabulary of a language can be used to distinguish between lexical (occurring) words, possible words, and impossible words. For instance, in English,

Table 1 A coarse taxonomy of nonexistent words

	<i>Accidental</i>	<i>Systematic</i>
Formal	Formal gap	Impossible lexical entry
Semantic	Semantic gap	Non-lexicalizable notion

apple is a (lexical) word of the language, *drapple* is a possible word that does not exist, and *drpple* is an impossible word in English. The word *drapple* is possible because it is a sequence of letters that correctly represents a well-formed phonological sequence in the language. Since different words can be pronounced in the same way (homophony) or spelled in the same way (homography), it is useful to distinguish between possible orthographic words, and possible phonological words. Or, in terms of the gaps in the lexicon, we can distinguish between (accidental) orthographic gaps and phonological gaps.

Formal gaps can be counted, by looking at the orthographic gaps for instance: If we consider that words have a finite length and all words consist of combinations of the 26 letters of the alphabet, there is a vast amount of possible sequences of letters, but still a finite number. The possible words form a (very) small subclass of the possible strings, and the lexical words form a small part of the possible words. Formal gaps can be searched for, for instance in the study of neologism: Formal neologisms are words that until recently were lexical gaps (by definition, they did not exist before and they have to be possible words) and have recently been “promoted” to lexical words.

A special type of formal gap is found in those possible words that can be correctly formed out of lexical words by means of morphological rules. Such words are also called *potential words*. Many potential words are not merely potential, but also used, and hence lexical words. Those potential words that are not (yet) used are called *morphological gaps*. For instance, from the verb *derive* we can form the lexical word *derivation*, but also the non-existing word **derival*. Morphological gaps in the derivational morphology are often called *derivational gaps*, whereas gaps in the inflectional morphology are mostly called *paradigm gaps*. The word **derival* is a potential word that is blocked by the existence of *derivation* and is therefore really a lexical gap. However, there is a large group of potential words that are not used, but also not blocked. Take for instance the word *?stratifiability*, which is not in use (at least it does not occur in any English dictionary), but is nevertheless perfectly acceptable and interpretable (the possibility of being stratified). For search words, it is unclear whether they should be considered lexical words or derivational gaps.

Semantic Gaps

Semantic gaps are those notions for which we have no words to express them. Most instances of semantic lexical gaps are not particularly interesting. To use an example from the Portuguese comedians Gato Fedorento: There is no word for the specific type of irritation you feel when you open the fridge to get some milk, and you find that there is no milk. However, there is also hardly a reason why such a term should exist, and, linguistically, such semantic gaps are hardly of interest.

Semantic gaps typically become interesting when contrasting them with existing words. Semantic gaps under that perspective are called *matrix gaps*, since they can be pointed out by drawing a table or matrix of the existing words, and the matrix gaps are those cells in that matrix for which there is no word. There is a good amount of work on what type of constraints are responsible for such matrix gaps. A good overview of such constraints is given in Proost (2007).

Table 2 An overview of types of lexical gaps

Morpheme gap	A sequence of segments that is permitted by phonological rules but not found. Fillers: <i>possible words</i>
Morphological gap	A word that can be generated from an existing word by productive morphological rules. Mostly understood as derivational rules, and therefore also called derivational gaps. Fillers: <i>potential words</i>
Paradigm gap	A morphological gap in the inflectional morphology
Semantic/functional gap	A lack of a word to express what a speaker might want to talk about
Taxonomic gap	A gap in the taxonomic structure. Fillers: <i>pseudo-words</i>
Translational gap	A word in one language for which no lexical unit exists in another to expresses that same meaning. Corresponding words: <i>untranslatable words</i>

A specific type of matrix gap is one that is expected to exist in a hierarchy, either a taxonomic or a meronymic hierarchy, but does not exist (see for instance Cruse, 2004). Such gaps are often called taxonomic gaps, and an example is the word *dedo* (see below). In the construction of a hierarchy, such gaps often get filled by made-up words, which Fellbaum (1996) calls *pseudo-words*. Pseudo-words are not necessarily words, but just tags to refer to the semantic gap. For instance, she postulates the tag “CREATION-FROM-RAW-MATERIAL” as a way to link a group of verbs, including *weave* and *mold*, that are taxonomically related but have no common hyperonym.

Another type of lexical gap of special interest concerns those notions that are lexicalized in one language, but not in another. For instance, there is no good translation for the Portuguese word *saudade* in English: *Saudade* is a deep nostalgic longing for something that one was fond of but no longer has. The Portuguese word *saudade* is therefore an untranslatable word in English, and corresponds to a translational gap. Translational gaps will be discussed in more detail below.

An overview of the different types of lexical gaps distinguished in this entry is given in Table 2, with an indication of how to refer to the non-existing words that “fill” those gaps.

Issues With Lexical Gaps

There are many questions and issues related to lexical gaps, since lexical gaps play a role in so many aspects of linguistics. In this section, two such issues will be discussed.

Unadapted Loanwords

Unadapted loanwords are strange creatures: They are impossible words that are nevertheless lexical words. As already observed by Lehrer (1974, p. 95), the incorporation of loanwords into the lexicon can itself change the orthographic rules of the language, making the unadapted loanwords possible words, which in turn creates new orthographic gaps for similar words that become possible by the modified orthographic rules but are not yet lexicalized.

One could argue that unadapted loanwords do not actually form part of the lexicon of a language, but remain words of the language they belong to; that *blitzkrieg* is a German

word independently of how often it is used in English text. In that case, unadapted loanwords should never be considered neologisms, since neologisms are by definition new lexicalized words. However, there are several problems with that view.

First, foreign words are often not incorporated in another language in their full use: The word *goal* in Dutch can only refer to a goal in football, not to any other use it has in English. Also, some “foreign words” are not even really loanwords but coined in a language where they should not be possible. The word *flexicurity*, for instance, was coined in Denmark but is only a possible word in English. (The word *flexicurity* refers to a political model to enhance both the flexibility and the security of the labor market, and is formed from the words *flexi[bility]* and *[se]curity*.) Furthermore, although loanwords can be unadapted orthographically, they are always at least partially adapted phonetically. And, finally, unadapted loanwords can form the base of (native) derivations: The English word *windsurf* forms the basis of the agentive noun *windsurfista* (‘windsurfer’) in Portuguese, which is a possible word neither in Portuguese nor in English. So unadapted loanwords differ in various ways from their original in the source language.

Linking Translational Gaps

When talking about untranslatable words, people typically quote examples like the Dutch *gezellig* or the Portuguese *saudades*, which are relatively rare cases of culturally dependent untranslatable concepts. However, the majority of lexical mismatches between languages are more mundane. To give two typical examples (Janssen, 2002): (a) in Spanish, the same word (*dedo*) is used for the extremities of your hand (fingers) and the extremities of your foot (toes), and (b) French lacks a specific word for a female foal (a filly). These are cases where the translational gap can also be described as a taxonomic gap: Cases where a hyperonym or a hyponym is missing in the target language.

Notice that a word like *finger* is not fundamentally untranslatable in Spanish: There are several strategies for translating such words (see for instance Baker, 1992), and in this particular case, one would use either *dedo* or *dedo del mano* (‘*dedo* of the hand’) as the translation depending on the context. But it is a translational gap since there is no direct, single word or expression in Spanish for the English word *finger*.

Relations between hyperonyms and hyponyms form the basis of traditional dictionary definitions: The hyponym can be defined in terms of the genus (the hyperonym) and the *differenciae specificiae*, the differentiating features. Therefore, in order to properly relate the Spanish word *dedo* with the English word *finger*, we should not only specify that they are (possible) translations of each other, but also how they differ from each other: that a *finger* is a *dedo*, but specifically one of the hand.

Conclusion

A common feature in the issues and concepts surrounding lexical gaps is that they have to do with the words that in a sense *almost* exist: Studying lexical gaps is studying the outer limits of the lexicon. Given the central role of the lexicon in language, it is therefore hardly surprising that lexical gaps pop up in a wide array of different topics.

Lexical Priming

MICHAEL HOEY

Lexical priming is the name given to a linguistic theory developed by Michael Hoey (in particular in Hoey, 2003, 2004a, 2005), which seeks to relate corpus-linguistic concepts such as collocation and colligation to the experimental findings of psycholinguists interested in the retardation and acceleration of word association. Linguistic theories since the mid-1950s have varied in the extent to which they have provided a convincing explanation of fluency or have offered a systematic and comprehensive model of variation. They have varied too in the extent to which they have sought to explain how listeners and readers know what meaning is intended when a word with multiple senses is used; indeed there has been more interest in the syntactic explanations for ambiguity than in the nature of disambiguation. Most importantly, from a corpus-linguistic perspective, they have usually made no attempt to account for collocation (which can be broadly defined as the partly arbitrary tendency of words to frequently occur in each other's environment, e.g., we often read of *growing fears* or *developing conflict*, but not so often of *developing fears* or *growing conflict*). The concept is usually attributed to Firth (1951/1957), but it is in the work of corpus linguists and other linguists concerned with authentic data such as Halliday (1966), Sinclair (1966, 1991), Leech (1974), Stubbs (1995, 1996), and Partington (1998) that the concept reaches its full potential.

A satisfactory theory of language should be able to account for collocation, since it has been found by corpus linguists to be not only present in all the languages they have studied but pervasive. Either collocation is a statistically odd phenomenon arising out of the accident that new linguistic utterances repeatedly make use of the same individual building blocks or it is the product of drawing upon a mental store of lexical combinations. Lexical priming assumes the latter. The explanation for collocation, according to this theory, has therefore to be psycholinguistic (because it assumes lexis is connected in the brain), simple in principle (because recovery of collocations is almost instantaneous) and complicated in effect (because the resultant combinations are often novel and creative).

Two well-studied phenomena in psycholinguistic experimentation are semantic priming and repetition priming. Experiments with semantic priming center around providing informants with a word or image (referred to as a prime) and then with a target word; the speed with which the target word is recognized is measured. Some primes appear to retard recognition and others appear to accelerate recognition (e.g., the prime *wing* might inhibit the recognition of *pig* but facilitate the recognition of *swan*). Pioneering semantic priming work was conducted by Meyer and Schvaneveldt (1971), who demonstrated that priming was scientifically demonstrable, and their work was followed through by Shelton and Martin (1992) (among others), who appear to show that semantic priming only works when the priming word and the target are associated in the informant's mind. According to this work, a relationship of meaning between prime and target is insufficient to produce the priming effect if the related words are not also associated, but McRae and Boisvert (1998) argue that if the words in question have closely related meanings there will be a priming effect even without association.

Repetition priming is rather different from semantic priming, in that the prime and the target are identical. Experiments with repetition priming center around exposing informants

to word combinations and then, sometimes after a considerable amount of time and after exposure to other material, measuring how quickly or accurately the informants recognize the combination upon reexposure; the evidence suggests that initial exposure has the effect of speeding up and improving the quality of recognition on reexposure. Key papers on these facets of repetition priming are those of Jacoby and Dallas (1981), who observed greater accuracy in the identification of the target, and Scarborough, Cortese, and Scarborough (1977), who noted the faster response time. Forster and Davis (1984) observed that these effects of repetition priming were more noticeable when the words in question were of low frequency in the language. Repetition priming potentially provides an explanation of both semantic priming and collocation, if we assume that the initial exposure is being stored in the informant's mind in such a way that its original form can be readily accessed. If a listener or reader encounters *a* and *b* in combination, and stores them as a combination, then the ability of *a* to accelerate recognition of *b* is explained. If the listener or reader then draws upon this combination in his or her own utterance, then the reproduction of collocation is also explained.

The lexical priming claim makes use of repetition priming and is that whenever listeners or readers encounter a word (or a syllable or a combination of words), they note subconsciously the linguistic context in which it occurs and, as they repeatedly encounter it, they begin to identify the features of the context that are also being repeated (Hoey, 2003, 2004a, 2004b, 2004c, 2005; Hoey, Mahlberg, Stubbs, & Teubert, 2007, chaps. 1 and 2). As these encounters with the word, syllable, or word combination multiply, listeners or readers come to identify the word or words that characteristically accompany it (its collocations), the grammatical patterns with which it is associated (its colligations), the meanings with which it is associated (its semantic associations), and the pragmatics with which it is associated (its pragmatic associations). Thus, if they read a "serious" newspaper, they will note that *according* often co-occurs in the paper with *to a* (a collocation); this combination in turn often co-occurs in such newspapers with RESEARCH SOURCE (e.g., *according to a study*), a semantic association that newspapers manifest to a greater extent than does academic writing; they will note, too, that it is likely to occur in the context of reporting something bad (a pragmatic association not shared with academic writing). If, on the other hand, they are exposed to academic texts, they may subconsciously identify *according to* as being likely to occur with proper nouns (e.g., *according to Smith*), a colligation that academic texts manifest more commonly than newspapers.

The notions of collocation and colligation are familiar in current corpus (and Firthian) linguistics (for colligation, see Firth 1951/1957; Halliday, 1959; Sinclair, 1996, 2004; Hoey, 1997; Hunston, 2001; Partington, 2003) as is semantic association, which is more commonly known as semantic preference (Sinclair, 1999); pragmatic association is closely related to the notion of semantic prosody (Louw, 1993; Sinclair, 1999). However, lexical priming theory does not only make use of well-established corpus-based concepts; it also claims about the words, syllables, and word combinations that we use that they have characteristic discourse and text-linguistic functions that listeners and readers likewise subconsciously identify as they repeatedly hear or see them in context. Specifically, the first of these discourse-oriented claims is that listeners or readers note subconsciously whether a word, syllable, or word combination is cohesive in its context and their repeated encounters with it will bring them to associate it with particular cohesive strategies (or to associate it with the absence of cohesion); these associations are referred to as its textual collocations (Hoey, 2004b, 2005), making use of the term "collocation" in Halliday and Hasan (1976), though the term "textual collocation" covers all types of cohesion, not only the type usually referred to by Halliday and Hasan as collocation.

A second discourse-oriented claim is that the listener or reader also notes subconsciously whether a word, syllable, or word combination tends to occur as part of any particular

textual relations; these are referred to as its textual semantic associations and include the kinds of textual relations identified in Winter (1977), Hoey (1983), Crombie (1985a, 1985b), Mann and Thompson (1986, 1987), and Longacre (1972, 1976, 1983, 1989), without being confined to these linguists' classifications. The final discourse-oriented claim is that the listener or reader also notes subconsciously whether a word, syllable, or word combination is regularly associated with certain positions in the discourse or text (e.g., at the end of a turn in conversation, at the beginning of a paragraph, in text-initial position, in the closing turns of telephone talk).

As examples of each of these claims, readers are likely to note that the combination *according to a* is directly repeated in newspaper stories relatively rarely but is often indirectly repeated by *said* or a related verb; this is therefore a textual collocation of *according to a*. The word combination is also likely to be subconsciously identified by the same newspaper readers as belonging to a claim–evidence relation, this being one of its textual semantic associations. The larger combination *according to a* RESEARCH SOURCE is furthermore likely to be subconsciously identified by such readers with the first sentence of the news story, more specifically with the second half of the first sentence, and often the end of that sentence (a key textual colligation for news stories). The evidence for these additional claims is largely anecdotal, unlike the earlier claims, which are indirectly supported by 20 years of psycholinguistic experimentation, as noted above. The one that has been most thoroughly investigated is that of textual colligation. In an AHRC-funded research project, Hoey, Mahlberg, O'Donnell, and Scott have demonstrated the pervasiveness of textual colligation in newspaper writing, identifying hundreds of words and word combinations which are associated with specific textual positions relatively rarely; it has yet to be shown whether other genres, spoken or written, manifest the same pervasiveness (Hoey & O'Donnell, 2007, 2008a, 2008b, 2009; Mahlberg & O'Donnell, 2008).

Despite the natural fascination with ambiguity that linguists have always shown, ambiguous utterances are rare even though most sentences contain polysemous items. Lexical priming theory claims that most speakers are differently primed for each polysemous sense, such that the primings for each sense are characteristically mutually exclusive, with the rare sense avoiding the usages associated with the common sense but the common sense occasionally occurring with the usages associated primarily with the rare sense. Thus we are primed to expect *reason* meaning "cause" to have the colligation of occurring within nominal groups containing determiners (*the reason, this reason, that reason*) and *reason* meaning "rational faculty" to have the opposite colligation of occurring in nominal groups without determiners. As the rarer use of *reason*, the latter virtually never occurs with a determiner. On the other hand, this sense is for most of its use primed to colligate with a possessive (*Imprisonment had cost him his reason*), whereas *reason* meaning "cause" occurs with the possessive relatively rarely (though not negligibly, e.g., *She gave as her reason . . .*).

An important feature of lexical priming theory is that, at the same time as the listener or reader comes to recognize through repeated encounters with a word, syllable, or word combination the particular semantic, pragmatic, grammatical, and textual/discoursal contexts associated with it, s/he will also subconsciously identify the genre, style, or social situation it is characteristically used in. Thus *according to a* RESEARCH SOURCE is typically found in newspaper English. Because we are primed to associate a word or word combination with the social/stylistic context it occurs in, we are able to hold within ourselves multiple versions of the language, some of which we will not choose to replicate in our own speech production. This brings us to what is arguably the most important claim about priming and certainly the claim most capable of misinterpretation. This is that all the features we subconsciously attend to have the effect of priming us so that, when we come to use the word (or syllable or word combination) ourselves, we are likely (in speech,

particularly) to use it in one of its characteristic lexical contexts, in one of the grammatical patterns it favors, in one of its typical semantic contexts, as part of one of the genres/styles with which it is most associated, in the same kind of social and physical context, with a similar pragmatics and in similar textual ways.

Despite appearances, this claim is not behavioristic. It might indeed be argued that it is a virtue of the theory that it accounts well for the mechanisms whereby novel utterances may be created at the same time without implying that every syntactic combination has any likelihood of occurring. Linguistic creativity, according to the theory, arises in several ways (Hoey et al., 2007, chaps. 1 and 2). First, as the wording of the claim indicates, our priming is based on data that are rarely uniform and, in uttering or writing, we have to choose which of the patterns in those data we are going to replicate. The permutations of even the most well-established primings of a common word, syllable, or word combination are sufficient to ensure a great variety of potential utterances, some of which will certainly be novel to their audience. Second, a language user may make an unexpected choice from an expected semantic paradigm (e.g., *three nano-seconds ago*, where the choice from a semantic paradigm of TIME SPAN is as expected but the item selected is not a collocate of *ago*). Third, a language user may override one or more (but not all) of his or her primings. So, for example, Dylan Thomas starts one of his poems “A grief ago.” In so doing he overrode his (presumed) priming for *ago* associating it with TIME SPAN but retained the semantic association with NUMBER (*a*) and the textual colligation of NUMBER + TIME SPAN + *ago* with text-initial position when in sentence-initial position.

At present, though lexical priming makes use of psycholinguistic research, the psycholinguistic aspects of the theory have been little investigated. The corpus-linguistic evidence that has been adduced has so far been shown to be compatible with the theory's claims, but it is still possible that the distinctive features of the corpus linguistics employed, such as textual colligation, are individually true but that the theory that gave rise to their investigation is unsupported by the psychological evidence.

Lexical Semantics

CARITA PARADIS

Introduction

Lexical semantics is an academic discipline concerned with the meaning of words. Lexical semanticists are interested in what words mean, why they mean what they mean, how they are represented in speakers' minds and how they are used in text and discourse. Outside linguistics proper, lexical semantics overlaps with disciplines such as philosophy, psychology, anthropology, computer science, and pedagogy. Within linguistics, it crucially overlaps with what is traditionally referred to as lexicology, which is the overall study of the vocabularies of languages, encompassing topics such as morphology and etymology and social, regional, and dialectal aspects of the vocabulary (Cruse, Hundsnurscher, Job, & Lutzeier, 2002; Hanks, 2007; Geeraerts, 2010). Lexical semantics also provides the foundation for various fields of applied research, such as research in language acquisition and learning, that is, how we as native speakers and learners of foreign languages acquire lexical knowledge (e.g., Robinson & Ellis, 2008; Gullberg & Indefrey, 2010; Pütz & Sicola, 2010), with computational linguistics (e.g., Pustejovsky, 1995; Asher & Lascarides, 2003), and with lexicography—the art and science of dictionary making (Béjoint, 2010).

As a point of departure, this entry states the most fundamental research questions that all theories of lexical semantics have to attend to when describing and explaining lexical meaning in language. With reference to the basic assumptions that follow from the research questions, a brief presentation of past and present approaches to lexical semantics is given, in chronological order. The subsequent sections discuss the relation between words and concepts, and different types of lexical semantic relations in language from a cognitive linguistics perspective. Finally, the last section offers a concluding statement of the nature of meanings of words in language in human communication.

Fundamental Issues in Lexical Semantics

This section establishes five questions that are of central importance to any theory of lexical semantics that makes claims to be a coherent framework within which lexical meanings can be described and explained. While all five are key questions, the first two are more basic than the others.

1. What is the nature of meaning in language?
2. What is the relation between words and their meanings?
3. How are meanings of words learned and stored?
4. How are meanings of words communicated and understood by language users?
5. How and why do meanings of words change?

The answers to these five questions make up the fundamental theoretical assumptions and commitments which underlie different theories of lexical semantics, and they form the basis for their various methodological priorities and explanations for word meanings

2 LEXICAL SEMANTICS

in language. Due to limitations of space, only the first two questions are attended to in the following sections; the other questions are only touched upon in passing.

The term “word meaning” is used in this entry as a practical cover term for different-sized form–meaning couplings. Needless to say, the notion of “word” is extremely problematic. When used, words are always in specific contexts and the influence exerted by those contexts is crucial for the meanings of words, irrespective of whether the context is of a linguistic, a discursive, or a social nature. Also, the notion of “word” does not necessarily refer to a unit in writing which is preceded by an empty space and followed by an empty space. A word, as it is used here, may very well be more than one word, such as *in spite of*, *at all*, *computer science*, *all of a sudden*. As a consequence, what this entry concerns itself with are units of form–meaning couplings with a distinct grammatical or semantic role in an utterance.

Once we try to grapple with word meanings in text and discourse, a fascinating world of phenomena is exposed to us, because the interpretations of a word may vary quite a lot from context to context, from clear cases of different senses to subtle reading differences, as in (1)–(6).

- (1) The *mouse* ran across the floor.
- (2) I always use the touch pad—never the *mouse*.
- (3) I like *white* wine.
- (4) I don’t like *white* coffee.
- (5) I *closed* my savings account with the local bank yesterday.
- (6) I *closed* the door and went away.

The contextual variants of *mouse*, *white*, and *closed* are interesting in different ways. *Mouse* in (1) and (2) differs with respect to the entities it refers to in the different contexts—an animal and a computer device, respectively. *White* in (3) and (4) is used about beverages, but the colors of the two beverages that are described as *white* are quite different: The color of white wine is yellow, and that of white coffee is light brown. Finally, in (5) and (6) the closing of an account is clearly different from the concrete closing of a door, and an interesting question in relation to this is of course what kind of entities can be closed. Contextual variation of this kind is at the heart of lexical semantics.

Theories of Lexical Semantics

While word meanings have been discussed in Western literature at least since Aristotle’s time, lexical semantics as a research discipline in its own right evolved in the 19th century. Unlike linguistic theories of today, lexical semantics in those days was not a coherent approach with a standard name, but rather the work of a number of individual researchers with an interest in historical texts and the roots of human culture along the lines of the philosophical trends of the time. Consequently, lexical semantics in those days had a historical–philological orientation and was mainly concerned with etymology and the classification of how meanings of words change over time. It is important to note that word meanings in the early days of lexical semantics were regarded as mental entities; they were thoughts, and change of meaning over time was the results of psychological processes (Geeraerts, 2010).

As a reaction to the psychological conception of lexical meaning in the historical-philological tradition, new ideas were brought to the fore in the 20th century by advocates of the structuralist movement, associated with Ferdinand de Saussure's work (1959). The structuralist takeover involved not only a fundamental shift in the conception of what meaning in language is, but also a change from a historical-philological, diachronic perspective to a focus on synchronic language. Structuralism came to dominate the scene for the better part of the 20th century. According to the structuralists, language is an autonomous, intralinguistic system of relations between words, organized on the basis of lexical fields (Lehrer, 1974; Cruse, 1986). Word meanings are not treated as psychological units. They are not substantial, but relational, and are defined in terms of what they are not. For instance, *long* gets its meaning from its relation to *short*. *Long* means what it means because it does not mean 'short'. Paradigmatic relations hold between words that can felicitously fill the same slot in an expression or a sentence (Lyons, 1977); for instance, synonyms such as *cold* and *chilly* in *It is cold today*, *It is chilly today*; antonyms such as *short* and *long* in *The cord is short*, *The cord is long*; hyponyms such as *cat* and *animal* in *The cat is in the garden*, *The animal is in the garden*.

The structuralists made a distinction between paradigmatic relations and syntagmatic relations. The latter are linear relations formed between words in a sentence. Cruse (1986, p. 16) maintains that

we can picture the meaning of a word as a pattern of affinities and disaffinities with all the other words in the language with which it is capable of contrasting semantic relations in grammatical contexts. Affinities are of two kinds, syntagmatic and paradigmatic. A syntagmatic affinity is established by the capacity for normal association in an utterance: there is a syntagmatic affinity, for instance between *dog* and *barked*, since *The dog barked* is normal . . . A syntagmatic disaffinity is revealed by a syntagmatic abnormality that does not infringe grammatical constraints, as in? *The lions are chirruping*.

The idea of the syntagmatic approach to meaning with its interest in strings of words, their collocations, and their co-occurrence patterns developed from research within the London School and the Birmingham School (Firth, 1957; Sinclair, 1987). According to the syntagmatic approach, the meaning of a word is defined in terms of the company it keeps in language use, or in terms of the totality of its uses. In this respect, the syntagmatic approach opened the way for new trends in linguistics, namely for usage-based approaches to lexical semantics where contextual factors and real language in use are prime research objectives for the description of meanings, as is the case in cognitive linguistics, dealt with below.

At the end of the 20th century, there was a reaction against the structuralist view of language as a system of relations between words without any recourse to language as a mental and psychological phenomenon, and without any relation to conceptual structure and thinking more generally. Once again, word meanings were considered to be psychological entities located in people's minds, rather than relations between words. This renewed interest in human language and the mind occurred in parallel with improvements in investigative methods aided by technical advancement and computerization in research. Structuralism was superseded by two totally different branches of conceptual approaches to lexical meaning: a generative and a cognitive approach. The breakthrough of the former came with an influential article called "The Structure of Semantic Theory" (Katz & Fodor, 1963), which set out to describe meaning as part of formal grammar in terms of meaning components; for example, "woman {+human, +female, +adult}." The main purpose of most work within generative lexical semantics has been concerned with the development of a logical formalism to be used either for the deconstruction of word meanings along the lines of Katz and Fodor (Jackendoff, 1983, 1990), or for the construction of lexical meaning

as in the generative lexicon (Pustejovsky, 1995). Also, broadly within this framework, work on the formalization of meanings in context as a function of rhetorical organization has been carried out more recently (Lascarides & Asher, 2007). In the latter models, simple feature decompositions have been replaced by models which take into consideration implicit structure and social frames, since language users know so many things that are relevant to linguistic interpretation. The ultimate purpose of these formalizations is that they should be useful for different kinds of computational implementation in the areas of information technology and computer science.

As in the generative framework, the conception of lexical meaning in cognitive linguistics is that meanings of linguistic expressions are mental entities. Apart from this commonality, the two frameworks differ in all essentials: that is, with respect to the foundational assumptions about what meaning in language is, how words relate to meanings, and how meanings are described and explained. For a comparison between the basic assumptions between the two frameworks, see Paradis (2003).

The cognitive approach to meaning emerged in the 1980s as a reaction to the view of grammatical knowledge as separated from other cognitive abilities and processes, held by the generativists. In contrast, the cognitive approach sees linguistic knowledge as in integral part of human cognition. Language cannot be studied without reference to the principles of human cognition. Cognitive linguistics is a maximalist approach in the sense that it aims to account for real language in use in all its complex glory. It is a sociocognitive framework in which lexical meanings are inextricably associated with language users' bodily, perceptual, and cognitive experiences of cultural and historical phenomena. Our use of words is constrained as well as promoted by subjective and intersubjective conditions in the act of social communication. There is no strict dichotomy between linguistic and encyclopedic meanings (Paradis, 2003). Rather, lexical meaning in cognitive linguistics is encyclopedic, taking into account any aspect of contextual meaning modulation that is relevant for a certain research task, integrating semantics, pragmatics, and grammar. In contemporary linguistics, cognitive lexical semantics is the most popular enterprise, in terms of both publications produced and the number of people who are involved in lexical semantic research (Geeraerts, 2010).

In the cognitive linguistics framework, there is a direct mapping of words and expressions to conceptual structure. Language forms an integral part of human cognition in general. The function of words is to evoke conceptual patterns in the cognitive system. There is no algorithmic linguistic level intermediate between linguistic expressions and their meanings. The cognitive approach to meaning is usage-based (Langacker, 1999, pp. 91–145; Cruse, 2002; Tomasello, 2003). Speakers and hearers are intentional creatures. The way we express ourselves is functionally motivated; we wish to get our message through to our interlocutors and to negotiate meanings in communication with other people in an optimally successful way. There are no stable word meanings; rather meanings of words are dynamic, context-sensitive, and construed online. This take on words and their meanings strengthens the link between language and psychology, language and sociology, language and cognitive science, and language and neurology, and opens the way for interdisciplinary research.

Thanks to technical innovation in the form of increased computer capacity and performance, and improvements in experimental equipment, quite a lot of empirical progress has been achieved lately. Contemporary research in lexical semantics is making extensive use of corpus methodologies and language technological tools. The use of large databases and Web-as-corpus has revolutionized the possibilities of investigating usage patterns in real language across genres and cultures, and further developed probabilistic usage-based ideas. However, it is not only textual data and computerized methods that play an important role in research in lexical semantics, but also different kinds of psycho- and neurolinguistic experiments used to describe and explain word meanings and to establish links between language and cognition, language in people's minds and in people's brains.

Words and Concepts

Having thus established that the predominant framework in current research in lexical semantics is that of cognitive linguistics, this section and the next deal with aspects of the relation between words and concepts and with lexical semantic relations from a cognitive perspective, stating that (lexical) knowledge is organized as concepts in people's minds. Concepts form systems of areas of human experience that provide the necessary contextual knowledge for our understanding of the world around us. This knowledge is referred to as *domains* (Langacker, 1987, pp. 147–82) (or “frames”; Fillmore, 1982, p. 111). Some are basic domains, which are inborn and make it possible for us to experience ranges of colors, pitches, tastes, smells, tactile sensations, spatial extensionality, the passage of time, and the experience of emotions. However, domains are not only basic; they may involve conceptualizations of any degree of complexity. For most concepts, in fact, we need to make reference to more than one domain, and linguistic expressions typically invoke multiple domains when they are used.

Not all domains have equal status. A domain may be defined as any knowledge structure that is of relevance to the characterization of a certain meaning. Semantic contrasts in the readings of words are always a result of the actual domains invoked in a particular expression in a particular context and to the ranking of prominence among those domains. Some domains are more central than others in a given situation. Langacker (1987, p. 154) illustrates this using *BANANA* as an example:

Most concepts require specifications in more than one domain for their characterization. The concept [BANANA], for example includes in its matrix a specification for shape in the spatial (and/or visual) domain; a color configuration involving the coordination of color space with this domain; a location in the domain of taste/smell sensations; as well as numerous specifications pertaining to abstract domains, e.g. the knowledge that bananas are eaten, that they grow in bunches on trees, that they come from tropical areas, and so on.

We may go on to ask ourselves which of these specifications are necessary. The simple answer is that all of them are necessary for a full knowledge representation as required in an encyclopedic, usage-based conception of meaning. When the word *banana* is used in human communication, one of these aspects may be profiled, while others form the base, or background. As Croft and Cruse (2004, p. 16) point out, “no concept exists autonomously: all are understood to fit into our general knowledge of the world in one way or another.”

Figure 1 The relation of different meanings of a word

Lexical Semantic Relations

There are essentially three different kinds of relations between word meanings. There are (a) words that share the same form but mean different things, such as homonyms and polysemes; (b) words that evoke similar meanings but have different forms, such as synonyms and hyponyms; and (c) words that have different forms and different meanings and are semantically related through opposition, such as antonyms.

Starting with words that have the same form but different meanings (Figure 1), we may identify two types of contextual variants of words, which we refer to as arbitrary and motivated variants. Arbitrary variants are unrelated and just happen to sound or look the same, or both, in contemporary speech or writing. They are often referred to as homonyms and can be exemplified by the word [sɒl] in different contexts, as in (7)–(9).

(7) I complained to the waiter because the *sole* was burnt.

(8) You are the *soul* of discretion.

(9) The *soles* are made of rubber.

Motivated variants, on the other hand, evoke meanings which are related through some kind of resemblance, metaphorization, or contingent conceptual associations (metonymization). Form–meaning pairings that are related in that way are called polysemes. Consider examples (10)–(15).

(10) The beam has *gone through the roof*.

(11) Prices have suddenly *gone through the roof*.

(12) Bill *slapped* Sally *in the face*.

(13) The way Bill behaved is *a slap in the face* after all Sally had done for him.

(14) The famine in the area is very threatening. There are too many *mouths* to feed.

(15) Fortunately, the whole *school* was on an outing, when the fire started.

The contextual variants of *go through the roof* in (10) and (11) and *slap in the face* in (12) and (13) are clearly related. The meanings in (10) and (12) refer to concrete undesirable events, while the meaning in (11) refers to the fact that something negative is going out of bounds and in a direction that is undesirable, and (13) there is a resemblance relation between the concrete activity of slapping, which is physically painful, and something that is emotionally painful. In (14) there is a contingent relation between the use of *mouth* for people and *school* for pupils and staff (Lakoff & Johnson, 1980; Paradis, 2004).

The second type of lexical semantic relations concerns words that evoke similar meanings (see Figure 2), which is the case for synonyms such as *father* and *dad*, *nice* and *pleasant*, and for hyponyms such as *animal* and *cat*, *walk* and *stroll*. Synonymy, including hyponymy, is essentially the opposite of homonymy and polysemy in the sense that in the case of synonyms the different word forms map onto “the same” concepts, while in the case of homonymy and polysemy the same word form evokes different concepts.

Note that there are no absolute synonyms in language use. There is a gradient of conceptual and communicative similarity (Cruse, 2010, pp. 142–5; Storjohann, 2010, pp. 69–94).

Figure 2 The relation of sameness of meaning (WALK) expressed by different words

Figure 3 The relation of opposition: different words as poles of the same meaning dimension

There is always something in the profiling of the meaning and the ranking of the domains in the domain matrix that differs. This becomes particularly evident in translation studies and lexicography. With the exception of many technical terms and names of manufactured objects such as dishwashers and vacuum cleaners, it is a well-known fact that words in one language rarely have exact translations in other languages. For instance, if speakers of English seek a translation of *comfortable* in Swedish, they must decide which of the following translations is adequate in the current context: *bekväm*, *komfortabel*, *behaglig*, *angemäm*, *tillräcklig*, *trygg*; or, if speakers of Spanish seek a translation for the appropriate use of the discourse marker *bueno* in Spanish, they have to decide whether to use *OK*, *all right*, *well*, *never mind*, *right*, *right then*, or *really*.

Finally, antonymy is a binary construal of opposition that holds between two different words in discourse. Antonyms are similar in that they are aligned along the same conceptual dimension, but they are maximally different in expressing the opposite properties of that particular dimension (Paradis & Willners, 2011). For instance, *good* and *bad* may be used as antonyms along the dimension of MERIT, and *long* and *short* along the dimension of LENGTH (see Figure 3).

When antonyms are used in text and discourse, they are restricted to the same meaning domain. For instance, *long* and *short* are antonyms in the context of horizontal extension for ROAD, but not in the context of vertical extension for BUILDING, where *low* and *high* or *tall* would be the preferred pairings. This is a constraint that is true of synonyms too. However, antonymy is different from the other relations mentioned in this section in that new couplings are frequently construed for various different purposes in text and discourse; for instance, *Fireflies prefer tall grass to mowed lawns*, where *tall* and *mowed* are used as antonyms. Antonymy seems to have special status as a lexical semantic relation in language in that antonyms are typically members of one-to-one relations, rather than one-to-many or many-to-many, and they are severely constrained in their relationship and by their alignment along the same meaning dimension within a domain (Paradis, Willners, & Jones, 2009; Paradis & Willners, 2011).

Words in Text and Memory

Language can be described as a conceptually structured inventory of linguistic units and cognitive routines. Word meanings are shaped by the context and the situations where they occur, and conventionalized uses of word meanings are the results of the entrenchment of words as form–meaning pairs in memory. Multiple meanings of words are expected as a natural consequence of a dynamic, usage-based view of language.

Lexical Syllabus

PAWEŁ SZUDARSKI

Rapid developments in corpus linguistics in the 1980s and 1990s have had a considerable impact on the study of language. The increasing availability of corpora, large databases of authentic language, created opportunities for the description of both written and spoken language and also led to new proposals in areas such as lexicology and English-language teaching (ELT). One such proposal stemming directly from corpus analysis is a lexical syllabus—an innovative approach to language teaching in which the content is organized around frequent vocabulary. According to Breen (2001), a syllabus is a plan of what is to be achieved through teaching and learning. In the lexical syllabus, this plan is organized around very frequent words. This entry presents the main characteristics of the lexical syllabus and its significance to language teaching practice.

The COBUILD Project and the Lexical Syllabus

The idea of the lexical syllabus originated among linguists working on the COBUILD project directed by John Sinclair, a leading figure in corpus linguistics. The research conducted for this project was seminal for the development of the field and resulted in the publication of the *Collins COBUILD English Language Dictionary* in 1987. Sinclair and Renouf (1988) were the first authors who suggested the lexical syllabus with its emphasis on the most frequent words in English. Their publication was followed by *Collins COBUILD English Course* (Willis & Willis, 1988) based on the lexical syllabus and Willis's (1990) book-length presentation of the main principles of this approach.

Through painstaking extraction of information in their corpus, Sinclair and his colleagues were able to show the interdependence of lexis and grammar. The notion of lexicogrammatical patterns was introduced to highlight co-occurrences of lexical and grammatical elements in language (Hunston & Francis, 2000; O'Keeffe, McCarthy, & Carter, 2007). Additionally, Sinclair (1991) challenged the acceptance of a single word as a basic unit of meaning and advocated paying much more attention to lexical chunks. As relationships between lexical and grammatical items were brought to light, it appeared natural to use such findings to inform the process of language learning and teaching.

Characteristics of the Lexical Syllabus

Sinclair and Renouf (1988, p. 148) state that any learner of English should concentrate on the “commonest word forms, their central patterns of usage and the combinations they typically form.” As corpus data show, certain words occur very frequently and form various lexical and grammatical patterns. English makes extensive use of the most frequent vocabulary, and consequently the knowledge of these words is essential to understand most texts. In order to promote such vocabulary in the classroom, Willis and Willis (1988) used corpus findings and established three thresholds for their *Collins COBUILD English Course* corresponding with three consecutive proficiency levels: the elementary course was based on covering the most frequent 700 words, the intermediate course on the next 800

words (a total of 1,500) and the advanced course on the next 1,000 words (a total of 2,500).

However, within the most frequent vocabulary, some words have straightforward phraseology and will be easy to learn (e.g., bed, office, run), whereas others will be highly complex. Some words are likely to present learners with difficulties since they are polysemous (e.g., “a book” and “to book something”), combine with other words in different types of lexical chunks (e.g., “make a speech” or “make somebody’s day”) and/or form patterns as syntactic frames (e.g., “she made her do it”). Such patterns have been emphasized by Francis, Hunston and Manning (1996, 1998) and Hunston and Francis (2000) in their *Pattern Grammar*. In this corpus-based approach, lexical items are analyzed with regard to their phraseological behavior since, according to Hunston and Francis (2000, p. 2), “all words can be described in terms of their patterns.”

Pattern grammar was not available in the 1980s when the idea of the lexical syllabus was developed. Yet it is clear that patterns should be taken into account when one approaches language teaching from a lexical perspective. Pattern grammar shows how each word is closely related to its grammar in terms of, for example, prepositions and clauses with which it occurs. Consequently, if words with complex phraseology are to be taught effectively, intricate lexicogrammatical relationships should be highlighted as well. However, the question arises if this is feasible given the time constraints that each teacher faces. Perhaps initially, in an elementary course, it would be reasonable to introduce the most frequent 300 words together with their phraseological patterns and then recycle them systematically to consolidate this knowledge. At the same time, keeping in mind that the purported aim is to cover the 700 most frequent words at this level, teachers should make use of every opportunity to present new words and the patterns they form with one another. However, since there are so many lexical items that are worth knowing, how should the teaching process be organized? Willis (1990) suggests using a pedagogic corpus as a guide.

The Lexical Syllabus and a Pedagogic Corpus

A pedagogic corpus contains authentic written and spoken texts that learners will have encountered in the course of their studies (Willis, 1990). As a result, the lexical syllabus can be based on the compilation of texts learners know and from which the most common lexicogrammatical partnerships can be retrieved. In the context of lexicogrammar, Willis (2003) also stresses “the grammar of orientation” which embraces verb tenses, determiners, the passive voice, and other grammatical features. These grammatical devices show how lexical items relate to one another and to the outside world. Therefore, the grammar of orientation helps learners understand what a message means in a given context and what it refers to. Moreover, Sinclair and Renouf (1988) propose that, if the natural language provided by the corpus is analyzed properly, all the relevant grammatical features of the language will resurface as well. Similarly, Willis implies that constructing a syllabus on corpus data should ensure coverage of the grammar of orientation. Thus, if students are exposed to materials based on the pedagogic corpus that highlight phraseology, it is probable they will familiarize themselves not only with lexical elements but also with grammatical features. Moreover, since the pedagogic corpus encompasses the most important meanings and patterns of English, teachers can use it as a source for devising activities that will raise learners’ awareness of lexicogrammatical patterns. Willis (2003) notes that the advantage of using authentic material is that one sentence may exemplify several patterns. Even if such sentences might cause difficulty, Willis claims that the language we present to learners does not have to be simple. As long as it conveys true meaning, learners will benefit from such input. Finally, the pedagogic corpus lessens

learners' dependence on their teacher and it allows them to realize what they need to learn to function effectively in everyday communication.

The Lexical Syllabus and Teaching Methodology

In order to fulfill its role, the lexical syllabus should be independent of such elements as course materials, methodology and assessment. According to Sinclair and Renouf (1988), the lexical syllabus is not related to any methodology "by any principles" but it may suggest specific types of teaching practice (p. 155). Willis (1990), on the other hand, explicitly promotes task-based approaches to teaching and learning and claims that they are a proper fit for the meaning-based instruction.

Since task-based approaches see language as a system of meanings, they rely heavily on activities in which language is used for communicative purposes. Learners are faced with tasks where the emphasis is placed on the outcomes rather than on the language itself. Tasks from the lexical syllabus require learners to stretch their linguistic resources but do not exert too much control over their creativity. Willis (1990) contrasts it with a structural syllabus represented by form-focused approaches in which the use of language is controlled and learners have little influence on the creation of meaning. Furthermore, in the task-based methodology, all tasks can be introduced in three stages: task—planning—report. Once learners have completed a task, they plan how to present their work (usually with the teacher's help) and in the last stage they display the outcomes in front of their classmates. Thus, overall, by completing tasks, language learners develop both their fluency and accuracy, for the task-based methodology assumes that "out of fluency comes accuracy" (Sinclair & Renouf, 1988, p. 128).

However, the lexical syllabus does not need to be realized through this methodology. Other methodologies (e.g., communicative language teaching) can be used as well, provided that they are based on authentic materials. Artificially created texts presenting concocted language are unlikely to ensure essential exposure to phraseological patterns. Authentic materials, on the other hand, present opportunities to explore naturally occurring discourse and give learners a chance to become autonomous and discover lexicogrammatical patterns themselves.

The idea of discovering patterns and promoting lexis figures prominently in Lewis's "lexical approach" (Lewis, 1993, 1996) which fulfills many conditions stipulated by Willis. Lewis strongly argues for placing more emphasis on lexis in language teaching. He perceives language as "grammaticalized lexis rather than lexicalized grammar" (Lewis, 1993, p. vi) and consequently rejects the grammar/lexis dichotomy. If teachers highlight the role of chunks in language, learners will become familiar with various multiword lexicogrammatical elements (see Schmitt, 2004) which help language users perform many language functions.

With regard to methodology, Lewis (2002) posits that the traditional presentation—practice—production framework, in which the teacher first presents a given item and then controls students' practice of it, needs to be rejected. In Lewis's opinion, such a framework does not reflect the true nature of language and should be replaced with the observe—hypothesize—experiment paradigm. As far as teachers' involvement is concerned, raising students' awareness of lexical patterns ought to be a central element of lessons. Interestingly, in a recent publication, Boers and Lindstromberg (2009) return to the tenets of the lexical approach and discuss how cognitive linguistics can inform the promotion of chunks in the classroom. This indicates that the lexical understanding of language has an increasingly prominent position in the field and more empirical work on these issues should be expected in the future.

Advantages and Disadvantages of the Lexical Syllabus

The lexical syllabus constituted an alternative to language syllabi that had been used before the advent of corpora. It must be said, however, that it was “less than a runaway success” (Thornbury, 1998, p. 9) and ELT practitioners did not adopt it widely. It appeared that teachers were not ready to accept an “unconventional” syllabus in which the content was not organized around traditional grammatical categories they were used to. Harwood (2002) suggests this could have led to its lack of “face validity.” Similarly, Thornbury (1998) posits that factors such as the absence of grammatical labels and the task-based methodology might have “scared off potential converts” (p. 9). Having presented so many tasks, Willis probably overwhelmed both teachers (who found it difficult to structure their teaching) and students (who did not enjoy completing one task after another).

However, despite widespread criticism, it must be acknowledged that the lexical syllabus was a breakthrough in the 1990s in terms of introducing an innovative approach to language teaching. Such changes are always welcome, for they force ELT practitioners to reflect upon their own methods of teaching and assess their effectiveness. What is more, the lexical syllabus and the *Collins COBUILD English Course* demonstrated for the first time how research findings from corpus analysis can inform language classroom practice. Currently, in light of the growing interest in phraseology and formulaic language, the significance of the lexical approach may be even broader. Major ELT publishers have already invested money in compiling language corpora to ensure that their coursebooks and dictionaries are based on authentic data. Yet little is still known about how to best tackle lexicogrammatical patterns in language pedagogy. More research needs to be done to determine how teachers should deal with the ubiquity of chunks in the second language classroom. The lexical syllabus thus may be a good starting point for developing new ideas in the area of vocabulary learning and emphasizing the role of lexis in second language acquisition.

Lexical Transfer and First Language Effects

HILDE VAN ZEELAND

The influence of the first language (L1) in second language (L2) acquisition has long since been acknowledged. Transfer, or crosslinguistic influence, occurs in all linguistic subsystems (Odlin, 2003). Lexical transfer concerns the effect of vocabulary knowledge in one language on the acquisition and use of vocabulary in another language. It can be positive (i.e., a learner's L1 facilitates L2 vocabulary acquisition and use) or negative (i.e., a learner's L1 hinders L2 vocabulary acquisition and use). Traditionally transfer was regarded as mostly negative, and research was carried out primarily by means of analyzing learners' errors. Nowadays, however, it is recognized that transfer can have both positive and negative effects on L2 acquisition, and that it can occur in various forms. Research into lexical transfer increases our understanding of L2 acquisition, use, and processing, and is thereby a great contribution to the field of applied linguistics. This entry provides an overview of the main types of lexical transfer from L1 to L2, and discusses a number of factors that may promote or hinder lexical transfer.

Types of Lexical Transfer

Lexical transfer manifests itself in transfer of form and transfer of meaning (Ringbom, 2007). Formal lexical transfer involves transfer of L1 spoken and written forms onto L2 lexical items (individual words or multiword units) that are being learned. Semantic lexical transfer refers to transfer of meaning or function features of an L1 lexical item onto an L2 one. Researchers may use different terminology to refer to this distinction between formal and semantic transfer. Jarvis (2009), for example, prefers the terms lexemic and lemmatic transfer.

Obvious occurrences of formal transfer are language switches (using L1 words in L2 production) and coinages (creating words by blending the formal properties of L1 and L2 lexical items). A third type of formal transfer involves cognates, or "historically related, formally similar words, whose meanings may be identical, similar, partly different or, occasionally, even wholly different" (Ringbom, 2007, p. 73). As cognate lexical items share formal characteristics and often also a common meaning, they can facilitate L2 use, particularly in comprehension. Cognates are therefore considered the main source of positive lexical transfer (Odlin, 1989). However, although cognates might carry virtually the same meaning (for example *father* in English and *fader* in Swedish), they may also be partially deceptive (*offer* has one meaning in English but two in Swedish) or even totally deceptive (*strand* means *beach* in Swedish but no longer does in English). The latter two cases are often referred to as "false friends." Yet, as Jarvis (2009) emphasizes, cognate relationships can involve different degrees of similarity in both form and meaning. This can make it difficult to predict their effect. Additionally, even if two cognate words carry the same meaning in two languages, differences in factors such as register, collocations, and frequency may still hinder appropriate usage in the L2.

The two main types of semantic transfer traditionally referred to in the literature are semantic extensions and calques (Ringbom, 2001). Semantic extensions occur when a learner knows that a lexical form exists in the L2, without being aware of its semantic restrictions. The learner assumes that the meaning of a target language word corresponds to the meaning, usually the core meaning, of the L1 lexical equivalent. This may result in, for example, a Finnish learner forming the sentence “he bit himself in the language” (Finnish *kieli* refers to both tongue and language) (Ringbom, 2001, p. 64). L1 semantic meaning is thus activated and transferred to the L2. Calques, the second type of semantic transfer, entail literal translations of L1 multiword units into L2 structures. One oft-cited example is a Swedish speaker’s reference to a bachelor as a *youngman* (from the Swedish compound item *ungkarl*) (Ringbom, 2001, p. 64). Calques thus reflect the way multiword lexical items are mapped to meaning in the L1 if translated in a word-by-word manner, rather than as a holistic phrase. Besides semantic extensions and calques, research has revealed several other types of semantic transfer in L2 use (a number of these are discussed by Jarvis, 2009).

An emerging line of inquiry in the research area of lexical transfer is word choice, or lexical reference. Rather than focusing on formal or semantic errors, word choice transfer research involves the L1 effect on “the preferential selection of certain words over others in contexts with multiple alternatives” (Jarvis & Pavlenko, 2010, p. 88). Hohenstein, Eisenberg and Naigles (2006), for example, found that Spanish learners of English used mainly verbs that carried path information (*to go, to enter*) whereas native English speakers preferred verbs that carried manner information (*to skip, to walk*), indicating the difference in how the two languages express motion. Likewise, Jarvis (2000) compared the word choices of Finnish and Swedish learners of English, and found instances of L1-related word choice which reflected how the two source languages conceptualize and express collisions.

Two other types of behavior may indicate lexical transfer: underuse and overuse in L2 production. These two transfer types do not receive as much research attention as other types of lexical transfer do, since they are relatively difficult to detect in comparison to lexical and semantic errors. Yet research has provided insight into how the L1 can lead learners to use certain lexical items excessively (e.g., speakers of Romance languages tend to overuse Latinate cognates in their L2; Benson, 2002), as well as avoid items (e.g., Hebrew learners of English tend to avoid idioms that are in form only partly similar to their L1 idiomatic equivalents; Laufer, 2000).

The Constraints on Lexical Transfer

A constraint on positive transfer can be defined as “anything that prevents a learner from either noticing a similarity in the first place or from deciding that the similarity is a real and helpful one” (Odlin, 2003, p. 454). Various constraints have been identified in transfer studies. In this section three prominent types of constraints on lexical transfer will be discussed: (a) learners’ perceptions regarding the difference and similarity between languages (“psychotypology”), (b) learners’ perceptions regarding the extent to which meaning senses of individual lexical items are core or peripheral (“prototypicality”), and (c) L2 proficiency.

Research has shown that similarities between the L1 and L2, which exist more between typologically related languages than unrelated languages, increase learners’ willingness to use formal transfer from their L1. For example, among learners of English as an L2 who know both Swedish and Finnish, L1 Swedish learners show more transfer from their L1 to English than L1 Finnish learners do. This can be explained by the fact that Swedish is

related to English whereas Finnish is not (Ringbom, 2007). Moreover, learners have a tendency to avoid L2 structures that do not have counterparts in their L1s. Phrasal verbs have been found to be used considerably more by learners whose L1 has a phrasal verb structure than by learners whose L1 does not (Sjöholm, 1995). Clearly, the more similarity between the L1 and L2, the more lexical transfer occurs. However, it has been emphasized by researchers that this degree of similarity is subjective rather than objective: It concerns how much crosslinguistic similarity individual learners perceive (i.e., what they actually notice) or assume. Kellerman (1983) used the term “psychotypology” to refer to such individual learner perceptions and assumptions of language proximity. In addition, similarities between L1 and L2 are a good predictor of formal transfer, but not of semantic transfer. Semantic transfer is equally likely to occur between two unrelated languages as it is between two closely related ones (Ringbom, 2007).

Nevertheless, not all lexical items that look similar across languages lead to transfer. Kellerman (1983) introduced the concept of “transferability” to refer to “the probability with which a structure will be transferred relative to other structures in the L1” (p. 117). In other words, learners will perceive some L1 lexical items as more or less transferable than others. Kellerman (1979) showed that prototypicality plays an important role in this in his much-cited study on the transferability of the Dutch word *breken* (‘to break’). This lexical item is similar in both form and meaning in Dutch and English, and is also used in various idiomatic expressions in both languages. The study revealed that Dutch learners of English were more likely to transfer literal meaning senses of the word (*the cup broke*) than figurative meaning senses (*she broke the world record*). Kellerman therefore concluded that core meanings of lexical items (in this study the more literal senses of *breken*) are more likely to be transferred than non-core meanings (in this study the more figurative senses of *breken*). As Kellerman (1983) explains, a particular L1 item is less transferable if the learner perceives it as “infrequent, irregular, semantically or structurally opaque, or in any other way exceptional, what we could in other words call ‘psycholinguistically marked’” (p. 117).

One other variable of significant importance in lexical transfer is L2 proficiency. It has been found that beginning learners focus primarily on formal similarities between their L1 and L2, and that they generally assume that L1–L2 similar lexical items also have the same meaning. This is also referred to as the “semantic equivalence hypothesis” (Ringbom, 2007). Based on this assumed semantic equivalence, learners establish so-called “primary counterparts”: simplified one-to-one relations between L1 and L2 words (Arabski, 1979). However, as learners become more proficient, they tend to become more aware of L2 items’ true meanings and functions, and primary counterparts are gradually modified according to the semantic restrictions of the L2 (Ringbom, 2007). Although this idea of a gradual change from semantic transfer to internal structuring of the L2 lexicon is generally accepted, Jiang (2000, 2004) challenges it by providing evidence of advanced L2 learners who still transfer preexisting L1 semantic structures onto L2 lexical items. In other words, even though advanced learners are well aware of the formal aspects of L2 items, they continue to maintain mental associations between L2 lexical forms and L1 semantic representations. This finding led Jiang to propose the “semantic transfer hypothesis,” which postulates that L2 learners may not get to the point where L1 semantic transfer stops, and that L1 semantic transfer may in fact be the “steady state of lexical performance in advanced learners” (2004, p. 419). Clearly, the issue of lexical transfer (both formal and semantic) in relation to proficiency is complex. Studies on the overall degree of lexical transfer at different L2 proficiency levels have similarly reported conflicting results (see Jarvis, 2000, for a detailed discussion).

Other Lexical Transfer Issues

There are a number of lexical transfer issues that have not been discussed in this entry. For example, whereas this entry has focused on L1 lexical transfer only, lexical transfer is in fact bidirectional (i.e., it occurs not only from L1 to L2 but also from L2 to L1). Bidirectional lexical transfer has received increasing attention in the literature (e.g., Pavlenko & Jarvis, 2002). In addition, the issue of multilingual lexical transfer is also prominent in transfer research (Ringbom, 2001). Another interest of lexical transfer researchers is accessibility and activation. It has been found that L1 words are activated in both L2 reception (Paribakht, 2005) and production (Poulisse, 1999). Together these and other approaches continue to increase our understanding of lexical transfer.

Lexicogrammar

TONY BERBER SARDINHA

Introduction

Lexicogrammar (or lexico-grammar) is a level of linguistic structure where lexis, or vocabulary, and grammar, or syntax, combine into one. At this level, words and grammatical structures are not seen as independent, but rather mutually dependent, with one level interfacing with the other. The idea that lexis and grammar are interrelated has been treated in a number of linguistic theories and approaches, more or less explicitly. This entry will focus on systemic functional linguistics (SFL) and corpus linguistics (CL), because these two theoretical-methodological frameworks have close ties to applied linguistics, and in both of them lexicogrammar plays a central role.

Systemic Functional Linguistics

Lexicogrammar is one of the formal elements of SFL theory. It is credited with “giving language its creative potential” (Egins, 1994, p. 121), and it is such a key component that the very term grammar is a shorthand for it in SFL (Halliday, 1995/2005, p. 251). Lexicogrammar is the system of wording, representing the linguistic resources for construing meanings through words and structures. Lexicogrammar realizes (makes concrete) the level of semantics, that is, it expresses meanings in words and grammatical structures, and is in turn realized by phonology (sounds) and graphology (orthography). Together with semantics, lexicogrammar forms part of the content plane of language.

The development of the notion of lexicogrammar in SFL is linked to the pursuit of the so-called “grammarian’s dream,” which entails treating lexis as final selections in grammatical systems: “the grammarian’s dream . . . is to turn the whole of linguistic form into grammar, hoping to show that lexis can be defined as ‘most delicate grammar’” (Halliday, 1961/2002, p. 54). Lexis is seen as “grammar extended to the point of maximum delicacy” (Halliday & Matthiessen, 2004, p. 46) or that point “where further uniqueness cannot be postulated” (Hasan, 1987/1996, p. 76). But Halliday himself conceded at the time that “for the moment, it seems better to treat lexical relations . . . as on a different level, and to require a different theory to account for them” (Halliday, 1961/2002, p. 54).

Hasan (1987/1996) pursued this dream by analyzing the transitivity system of nine English verbs (see Figure 1, which shows immediately relevant options only). The transitivity system is a set of features of processes (verbs) that stand in contrast with each other, representing choices made speakers during language use; it includes both the participants (i.e., functional roles such as Actor, Goal, Sensor, etc.) and the circumstances (e.g., Location, Cause, Manner, etc.) associated with the processes.

A sentence such as “she scattered her clothes all over the place” (p. 90) realizes several choices, including the following, in that network:

- Material: Action: Disposal: Deprivation = a material action of disposal (scattering) involving change in location of that which is disposed of (the clothes);
- Iterative = an inherently repetitive activity (clothes were probably not scattered all at once);

Figure 1 Transitivity system (adapted from Hasan, 1987/1996, p. 79)

- Beneficile: potential = one of the parties involved in the activity (she) benefits from (is at the receiving end of) the action (she is affected by the scattering one way or another).

Representing the whole of the lexicogrammar of a language in this way has remained a dream only; as Halliday and Matthiessen (2004, p. 46) put it, “it would take at least 100 volumes . . . to extend the description of the grammar up to that point for any substantial portion of the vocabulary of English.”

In SFL, lexicogrammar is seen as continuum, with grammar on one end and lexis on the other (see Figure 2). Hence, actual descriptions of lexicogrammar vary considerably: some tend toward the grammatical end, whereas others move toward the lexical, and still others strike a balance in between. Accounts that favor the grammatical pole highlight lexicogrammar as a closed structural system, whereas those that move toward the direction of lexis see lexicogrammar in terms of meaning-specific open sets.

Figure 2 Grammar–lexis continuum (adapted from Halliday & Matthiessen, 2004, p. 43)

Lexicogrammatical analyses vary in terms of two axes: paradigmatic and syntagmatic. Following Saussure, the former refers to “the axis of choice,” or “relations between an element and what could have occurred in place of it (but did not),” and the latter to “the axis of chain,” or “relations between an element and what goes together with it” (Halliday & Webster, 2009, p. 63).

By crosstabulating the two ends of the lexicogrammatical cline with these two axes, four basic descriptive options are derived: syntagmatic + lexical, syntagmatic + grammatical, paradigmatic + lexical, and paradigmatic + grammatical. These are illustrated below.

Syntagmatic + lexical. This kind of description focuses on collocation, or the tendency for words to attract (and repulse) others in their immediate vicinity. Lexicogrammar is (typically) seen as pairs of words that tend to collocate (frequently occur) together, as attested in a corpus. For instance, in English, “change” collocates with “mood” and “season,” “grass” with “flower” and “green,” and “flower” with “bloom” (Halliday & Matthiessen, 2004, p. 38).

Syntagmatic + grammatical. This is the most common type of description found in the systemic literature, and it is carried out by assigning words or phrases to the grammatical classes available in systems. Such classes form a structure, which in systemic terms means

Table 1 Theme analysis

<i>You</i>	<i>feed</i>	<i>him</i>
THEME	RHEME	

“an organic configuration of elements, which we can analyze in functional terms” (Halliday & Matthiessen, 2004, p. 39). For example, the clause “you feed him” can be analyzed in terms of Theme (the point of departure for the message) as in Table 1.

Paradigmatic + lexical. This refers to a description in terms of lexical sets, which are formed by words sharing semantic features and similar collocational patterns. The semantic relations between the words in the set are generally synonymy, antonymy, meronymy, and hyponymy. For instance, “jacaranda,” “pine” and “sequoia” form a lexical set of trees (by means of hyponymy), where “tree” is the superordinate and the other words are its hyponyms (types of tree).

Paradigmatic + grammatical. This involves spelling out whole systems and showing what features of those systems were available and among these which were actually realized. This is exemplified by the analysis of transitivity by Hasan, presented above.

One important element of lexicogrammar is how frequent a particular feature is. According to Halliday (2002, p. xv), “a system is made up not simply of ‘either m or n’ but of ‘either m or n with a certain probability attached’.” In other words, in systemics language is seen as a probabilistic system, and thus, in analyzing lexicogrammar, the frequency of linguistic units should be taken into account.

A number of studies have looked at the relative frequency of choices in systems. Halliday (Halliday, 1992, p. 65) described a wide range of English systems, such as polarity, based on the 18 million words of the first COBUILD corpus, and found out its probabilities are 90% positive and 10% negative (represented as positive _{0.9} / negative _{0.1}). Matthiessen (2006, p. 137) calculated the probabilities of several English systems in corpora. For the system of transitivity, he identified the following probabilities for process types (rounded off): material _{0.37} / relational _{0.38} / mental _{0.11} / verbal _{0.09} / behavioral _{0.04} / existential _{0.02}.

Corpus Linguistics

CL is naturally concerned with lexicogrammar, as corpus linguists deal with lexis, grammar, and the relationship between the two as a matter of course in their analyses of corpus data. By contrast to SFL, in CL lexicogrammar is normally approached from the lexis, or to use the systemic terminology, it is usually of the lexical syntagmatic kind. There are many different terms in CL to characterize lexicogrammar, including collocation, colligation, phraseology, lexical pattern, chunk, lexical bundle, formulaic language, and multiword units among others. The field is so diverse that it is difficult to talk about it in terms of key concepts. Rather, it is more appropriate to present a summary of key works that deal with the issue.

John Sinclair, considered by many the founder of modern-day CL, is the main proponent of a lexical approach to lexicogrammar. He does not use the term itself, and is actually very critical of the systemic-functional view of it, because according to him “lexis was assigned the role of picking up the scraps from the tables of syntax.” (Sinclair, Jones, & Daley, 1970/2004, p. 15). He prefers the term “lexical grammar” to describe his lexis-driven approach, since lexicogrammar “does not integrate the two types of pattern as its name might suggest—it is fundamentally grammar with a certain amount of attention to lexical

patterns within the grammatical frameworks" (Sinclair, 1990/2004, p. 164). He concludes that "it is not in any sense an attempt to build together a grammar and lexis on an equal basis" (p. 164).

Hunston and Francis (2000, p. 251) also argue against the lexicogrammatical cline proposed by systemicists. According to them, even though it is technically possible to start from lexis in such a view, in practice this is not the case, because the very idea of an underlying system network where lexis is the end point implies directionality, from grammar to lexis. That is, the systemic lexicogrammatical cline always implies the primacy of grammatical systems and the subsequent downgrading of lexis to a secondary role.

In reply, Halliday (2008) referred to the "lexicologist's dream," that is, the desire to extend the "lexicological method to the 'grammar' end" (p. 33), thus reducing "all the 'grammar' to a part of the lexis" (p. 31), as when grammatical words such as "the," "of," and "that" are treated as ordinary dictionary entries.

John Sinclair wrote extensively on the way that corpus evidence blurs the distinction between lexis and grammar and on the need to start linguistic analysis afresh from the word. In his chapter entitled "The meeting of lexis and grammar" (Sinclair, 1991), where he offers an account of the word "of," he challenged the view that this word should be treated as a regular preposition. He noted that it is frequently used in noun groups rather than prepositional phrases, and by looking at evidence from a corpus, he found that most cases of "of" involved noun phrases where, contrary to grammar, the head noun was the second one. He then classified nouns in categories such as focus (e.g., "the middle of a sheet," where the first noun specifies some part of the second) and support (e.g., "the notion of machine intelligence," where N1 offers some kind of support to the meaning of N2). He found it troubling that "the word which is by far the commonest member of its class . . . is not normally used in the structure which is by far the commonest structure for the class" (p. 83), i.e., prepositional phrase or adjunct. He proposed that very frequent words such as "of" "are so unlike the others that they should be considered as unique, one-member word classes" (p. 83), and advocated that "the one-member class is the place where grammar and lexis join" (p. 83). That is, the distinction between lexis and grammar would have become so blurred that it was no longer possible to consider these two levels as independent.

Susan Hunston and Gill Francis (2000) present a corpus-driven approach to grammar whose outcome is a lexical grammar containing a large inventory of lexicogrammatical patterns. They started from the coding that lexicographers working on the COBUILD English dictionary assigned to every entry, then ran concordances for these words, and upon examining the evidence provided by them, categorized the verbs, nouns, and adjectives into patterns. A pattern was defined as "a phraseology frequently associated with (a sense of) a word, particularly in terms of the prepositions, groups, and clauses that follow the word" (p. 3). They saw patterns and lexis as "mutually dependent, in that each pattern occurs with a restricted set of lexical items, and each lexical item occurs with a restricted set of patterns" (p. 3). To illustrate, the previous example sentence "she scattered her clothes all over the place" realizes the pattern "V n over n" (Francis & Hunston, 1996, p. 417), a case of a verb followed by an object and adjunct. At the same time, this use of "scatter" falls into the "throw group" of verbs, together with others such as "hurl," "throw," and "toss." The verbs in this group all relate to "making something move away from you, often with force" (p. 315).

Douglas Biber has looked at a wide array of lexicogrammatical units. In Biber, Conrad, and Reppen (1998, p. 84) lexicogrammar was defined as "associations between words and grammatical structures," and it is argued that such patterns can be used to differentiate between apparently synonymous words or grammatical structures. For instance, the authors showed that "begin" and "start" could be differentiated in terms of their valency patterns:

the former is typically used in the transitive pattern “begin + to-clause” in fiction and in intransitive patterns in academic genres, whereas the latter is usually found in intransitive patterns. They also looked at the patterns of use of two nearly equivalent grammatical constructions, namely “that-clauses” and “to-clauses.” Their results indicated two different sets of verbs occurring with each one of these complement clauses: for “that-clauses,” the most frequent verbs are “think,” “say,” “know,” “see,” and “show”; for “to-clauses,” they are “want,” “like,” “seem,” “tend,” and “appear.” Biber has also worked at length on lexical bundles, i.e., “combinations of words that in fact recur most commonly in a given register” (Biber, Johansson, Leech, Conrad, & Finegan, 1999, p. 992), and categorized them in terms of their grammar, such as “personal pronoun + lexical phrase” (“I don’t know what”), “*wh*-question fragments” (“where did you get”) and “anticipatory *it* + verb phrase/adjective phrase” (“it is possible to”) (pp. 1001–24).

Michael Hoey has investigated the relationship between lexis and grammar from several angles, and proposed the concept of lexical priming to explain why certain words prefer or avoid particular lexical, grammatical, textual, and pragmatic associations (Hoey, 2005). According to him, individual language users build mental profiles of words as they encounter them, consisting of the patterns in which these words were more frequently met. As a result, some patterns become “primed” (ready to be used) by particular individual users in particular situations. Colligation is one of the manifestations of lexical priming, and is redefined as “the grammatical company a word or word sequence keeps (or avoids keeping) . . . , the grammatical functions preferred or avoided by the group in which [it] participates, [or] the place in a sequence that [it] prefers (or avoids)” (p. 43). He analyzed the colligation of each of a group of related nouns. In terms of their predilections, “consequence” and “use” were typically part of adjunct; “preference” and “aversion,” part of object; and “question” was attracted to both subjects and objects equally. With respect to their aversion, “consequence” shunned objects; “preference,” “aversion,” and “use” complement position; and “question” showed no particular avoidance among these categories. He concluded that their patterns could not be deduced from their prior semantics or grammar.

To conclude, the separation between lexis and grammar has been one of the cornerstones of linguistic scholarship, being incarnated in the dictionary and grammar, the two main reference points for language study. However, systemic functional linguistics and corpus linguistics, each in its own way, reunite these two levels, and despite some divergence, advocate the uninterrupted continuity between and/or fusion of lexis and grammar.

Lexicography Across Languages

YUKIO TONO

Most lexicographical theory and practice is based on the analysis of a first language (L1), but lexicography can be extended to the realm of “across languages,” and is then called bilingual or multilingual lexicography. It is an area of particular relevance for language learners and translators. This entry will focus on a particular aspect of multilingual lexicography: how technology has affected the innovations of dictionary making involving more than one language. (For a more general introduction on bilingual dictionaries, see Svensén, 2009.) I will begin by briefly reviewing some basic concepts and then discuss technological advances and related issues in lexicography across languages. Finally, some recent innovations in bilingual lexicography will be described (with a special emphasis on the use of corpora) in relation to second language (L2) vocabulary learning studies and user needs/skills research.

Basic Concepts of Lexicography Across Languages

Before we can say much about the technology of lexicography across languages, there are a few concepts and terms that we need to clarify. Bilingual dictionaries specify, for words and expressions in the *source* or native language (L1), their equivalents in the *target* language, that is, another language that is not native for the user (L2). As in the case of monolingual dictionaries, these dictionaries can be used in two directionally opposite ways: *encoding* and *decoding*. Encoding is the process of putting a sequence of words into a sentence (or a paragraph or a discourse) in order to convey meanings. Decoding is the opposite process. Therefore, there are two different types of bilingual dictionary:

- an L2–L1 *reception/translation* dictionary (for understanding L2 text), and
- an L1–L2 *production/translation* dictionary (for producing L2 text).

Mono- or *unidirectional* dictionaries usually contain a single text in which the target language is explained in the source language; but some dictionaries have two sets of texts and work both ways (i.e., L2–L1 and L1–L2), and are called *bidirectional* in the sense that both groups of language speakers, whether L1 or L2, can use them in either direction for either purpose (encoding or decoding).

Another important distinction is between *bilingual* and *bilingualized* dictionaries. Bilingual lexicography traditionally involves the translation of monolingual dictionaries (or databases). Thus it is common for major dictionary publishers to have various bilingual versions of their monolingual dictionaries published in foreign countries. In such cases, they usually provide a database or framework for the target language dictionary entries, which contain all the information relevant to the creation of a dictionary in the target language (i.e., monolingual format), and local publishers will only add translations (the process technically called “transfer”; Atkins & Rundell, 2008, p. 465) to the necessary entries. In countries where bilingual lexicography is relatively slow in development, so-called *bilingualized* dictionaries are popular; these are basically monolingual dictionaries in their original

format with minimum semantic glosses in the native language alongside each definition. In countries where bilingual lexicography is more fully developed, mere translation of monolingual dictionaries is not appreciated, and a complete bilingual framework will be used in order to produce original bilingual dictionaries.

There are some issues specific to bilingual lexicography. For example, the transfer between monolingual and bilingual entries involves problems of mapping lexical items between the two languages. We try to work out a balance between the “reality” as it is perceived in the two cultures and the words in the languages which describe it (Duval, 2008). Total equivalence cannot be achieved in most cases, and lexicographers resort to a near-equivalent or a gloss to fill the semantic gap of direct translations. In other cases, it is also possible to supplement the direct translation by using usage notes. All these devices need careful planning and guidance for lexicographers. This practice of translation “transfers” can also be applied to grammar, labels, and illustrative examples.

While major monolingual learners’ dictionaries (e.g., the *Longman Dictionary of Contemporary English*) already draw attention to frequency variation in speech and writing, bilingual dictionaries have a further role: They have to deal with the problem of choosing the right translation equivalents whose frequencies are almost equal to the source language items in the same registers. This is often a difficult task, but would be very important for those who create subtitles for movies or TV dramas, or for translators of speeches made by government ministers and other VIPs. In practice, bilingual lexicographers sometimes deliberately ignore this aspect of variation, especially those who work with learners’ dictionaries. Teachers are still conservative and prefer formal translation equivalents to informal, impolite expressions. They often think it is not appropriate to list offensive words in the entries.

Technological Advances and Issues in Lexicography Across Languages

While many bilingual dictionary projects are still based on translation within a monolingual framework, there are some interesting technological advances that are changing the way bilingual/multilingual dictionaries are being made. Three of them will be discussed here; (a) bilingual lexicon acquisition from parallel corpora; (b) the integration of parallel text databases into electronic dictionaries; and (c) multilingual, multimodal dictionary portals.

Semi-Automatic Identification of a Parallel Terminology

The information explosion of the Internet has made bilingual texts increasingly available. It is now possible to use translation pairs found in such texts for the automatic compilation of a bilingual lexicon. Matsumoto and Utsuro (2000) give a basic overview of this process: A pair of bilingual texts, which are translations of each other, is prepared. The texts will be *aligned* in the sense that there is an order-preserving mapping between sentences in parallel texts. Then the texts will go through a series of preprocessing steps, including (a) lemmatization/segmentation (mapping surface word forms to the underlying base forms), (b) part-of-speech (POS) tagging (assigning word class tags to each word), (c) shallow-parsing/noun phrase (NP) recognition (identifying and marking NP chunks), and (d) parsing/bracketing (analyzing syntactic or dependency structures). The processed bilingual texts will then be compared and analyzed by computer, using various heuristics such as machine readable dictionary (MRD), cognate, POS, or positional heuristics, in order to determine translation pairs. For instance, it is more likely that two sentences are translations of each other if they share the same linguistic features, such as lexical items identified as translation equivalents shown in MRD. Translation pairs could be simply single

words, but may also be larger units such as NOs, collocations, and dependency structures (i.e., structures showing dependency relations between the words in a sentence). So far, most of the attempts at bilingual lexicon construction using parallel texts have concentrated on the correspondence between words or NPs, and significant progress has been made in the extraction of word-/NP-level translation lexicons (see Matsumoto & Utsuro, 2000, for further detail). There are already many such bilingual terminological dictionaries semi-automatically created using the technologies described above (e.g., the *Japanese-English Dictionary of Technical Terms*; CJK Dictionary Institute, 2009).

Integration of Parallel Text Databases Into Electronic Dictionaries

Major online dictionaries (e.g., The Free Dictionary.com, www.thefreedictionary.com, or Dictionary.com, <http://dictionary.reference.com>) are usually based on unabridged monolingual dictionaries such as the *Random House English Dictionary* or the *American Heritage English Dictionary*. If bilingual functions are available, in many cases (e.g., FREELANG Dictionary, www.freelang.net) they provide only bidirectional word lists and little other information. In this respect, Eijiro (for the Web version, see www.alc.co.jp) is unique. It has developed a hybrid resource that combines ordinary electronic dictionaries with parallel text databases. Its entry structure, too, is unique: Instead of having a traditional dictionary entry format, each piece of information, whether it is a word, phrase, or example, has independent entry status, and everything is in parallel in English and Japanese. Thousands of hard-to-translate phrases, proper names, and compounds are collected and put into the database. As the number of entries has reached 1.8 million, Eijiro can serve as both a bilingual dictionary and a bilingual parallel text database, which plugs the gap in collocational information that exists in current bilingual dictionaries.

Multilingual, Multimodal Dictionary Portals

The advent of Internet technologies has improved the design of online dictionaries radically. Lexicool.com (www.lexicool.com), a directory of online bilingual and multilingual dictionaries, has links to over 7,000 dictionaries and glossaries. The English dictionary section has more than 60 languages as target languages and each language page has further links to hundreds of dictionaries (e.g., 1,201 for German, 1,799 for French, and 197 for Japanese, as of February 2010). Recent trends are the crossover of dictionary entries and various other contents related to the search words. For example, WordReference.com (www.wordreference.com) has more than 10 different bilingual dictionaries (English-Spanish/French/Italian/German/Russian/Polish/Romanian/Turkish/Chinese/Japanese/Korean/Arabic, etc.), many of which can be searched bidirectionally. If the English word *flower* is searched in English-French dictionaries, the results show several different types of lexicographic information: (a) the entry from the *Concise Oxford-Hachette English-French Dictionary*, (b) the other headwords that contain *flower* in the definitions, (c) example sentences from English-French translation pairs that contain the word *flower*, and (d) compound forms (e.g., *basket flower*, *flower arrangement*, *flower show*, etc.). The site searches information across different dictionary sets and provides summaries of the output.

The very notion of what a dictionary is has been changing since the advent of the Internet. Dictionary portals such as WordReference.com expand their offerings by incorporating various online resources and information related to the search words that users key in. The advantages of the social networking potential of the Internet add even greater extra value to these sites. In addition to general lexicographic information for the search word, WordReference.com provides links to Internet forums among translators, in which people discuss how to translate various expressions related to the search word in both the source and target language. The discussions and comments in these forums can prove very helpful

in solving problems that individual translators may be facing. In addition, WordReference.com links to many other languages, along with Google search results (see also <http://translate.google.com>), and images related to the search word.

Although bilingual lexicography has benefited from the technological advances described above, several issues remain to be resolved. First, although automatic extraction of bilingual lexicons is relatively easy for fixed technical terms, translation of literary texts or imaginative writings is still extremely difficult. Cultural, stylistic, and rhetorical factors affect the choice of appropriate translation equivalents in these domains, and it is still up to the skills of individual human translators or lexicographers to choose the right equivalents. Second, while online dictionaries such as Eijiro or WordReference.com are extremely useful, there is always a chance of information overload. Users can be overwhelmed by the mass of information returned from the query. Only skilled users can make full sense of the results, and the reference acts of less skilled users tend to be very limited and problematical, because they only look for the information shown at the very top of query results. Third, we should always observe carefully the balance between cost and quality. As Web resources grow rapidly and a growing number of open-ended free dictionary sites (e.g., Wiktionary, <http://en.wiktionary.org>) become available, there is a genuine concern among professional lexicographers that the quality of the contents of the free dictionaries is not as high as that of commercial ones. While Wikipedia offers “facts” about the world, Wiktionary offers “word meanings” of a word. Writing an encyclopedia entry requires profound knowledge about the subject in question, but any serious enthusiast or hobbyist may have sufficient knowledge to write an acceptable entry. Writing a dictionary entry, however, requires more professional expertise, as it takes years of training and experience in analyzing and creating word meanings to write good definitions. Wiktionary contributors are likely to have varying levels of such expertise.

Recent Innovations in Bilingual Learners’ Dictionaries

While all approaches to bilingual lexicography are based on Atkins and Rundell’s (2008) three steps (*analysis*, *transfer*, and *synthesis*), various new ideas have been introduced and tried out in an effort to make dictionaries more user-friendly. Here we will discuss three topics: (a) corpus-informed descriptions, (b) integration of vocabulary learning strategies, and (c) user needs/skills research.

Corpus-Informed Descriptions

Since the publication of the *COBUILD English Dictionary* in 1987, the use of corpora has been popular, especially in pedagogical lexicography. Major monolingual learners’ dictionaries now provide detailed information about the frequency of the common words in their respective headword lists. Collocations or chunks taken from corpora are often shown as useful expressions. Example sentences are either selected from corpora or rewritten from the corpus evidence (Rundell, 1998). Cobb (2003) even suggested that actual concordance lines could be displayed in corpus-based electronic dictionaries. In Japan, a pocket electronic dictionary manufactured by SEIKO Instruments Inc. (SII) in 2004, for the first time in the world, made the *COBUILD English Dictionary* available with an additional 500-million-word “WordBank,” the actual corpus data from the Bank of English.

For specific target learners, the use of learner corpora (corpora of L2 learners’ speech or writing) is found to be effective (Tono, 2009). While some monolingual learners’ dictionaries (e.g., the *Longman Dictionary of Contemporary English*, *Longman’s Essential Activator*, the *Cambridge Advanced Learner’s Dictionary*) have used learner corpora for their “common learner error” notes or columns, it has been found that specific learner groups are particularly prone to

specific patterns of error. If the aim of a dictionary is to serve the needs of particular target user groups, it is desirable to incorporate the information on common errors made by learners of specific L1 backgrounds. As the *Cambridge Learner's Dictionary* was once semi-bilingualized in Japan, the editor on the Japanese team investigated the Japanese learners' subcorpora in the Cambridge Learner Corpus and added extra columns on learner errors specific to Japanese learners of English. Such localization is necessary in order to make bilingual versions more useful.

Second, there is a growing awareness that usage notes in pedagogical dictionaries should take into account the developmental aspects of L2 learner proficiency. For this, a corpus of L2 learners' speech or writing, called a learner corpus, is useful. One of the special features of learner corpora is "error tagging," which annotates different types of learner errors (Granger, 2003). By using error-tagged learner corpora, we can extract frequency information on different error types, which will contribute to the analysis of learner language and how to provide pedagogical support for overcoming errors. Most "common learner error" notes in monolingual dictionaries are based on the analysis of the writing of relatively advanced learners. An analysis of a corpus of L2 learners of specific L1 background (Tono, 2009) has shown that there is a relationship between particular error patterns and stages of acquisition. For example, verb morphology errors are more common for beginning and intermediate-stage learners, while lexical choice errors are observed more commonly in advanced learners' writing. Therefore, it is desirable to provide different types of "common error" notes for different levels of users. Findings based on the analysis of target-user L2 learner corpora should be an integral part of usage descriptions in bilingual learner dictionaries.

Another interesting application of corpora in bilingual lexicography is a corpus-based dictionary of synonyms (Tono, 2005). This dictionary contains about 200 Japanese entries, each of which have three to five English translation equivalents. For example, the Japanese word *kashikoi* can be translated as 'clever', 'intelligent', or 'wise'. The problem is that Japanese learners of English often find it difficult to use these English words in a proper way. Typical dictionaries of synonyms list all these and explain the differences in meanings with some illustrative examples. This kind of metalinguistic explanation is not always helpful, often giving learners the extra burden of having to understand the metalanguage. Tono (2005) took a totally opposite approach. By showing the most typical collocations for those three words, the dictionary enables users to compare the usages of similar words and figure out how to use them in different contexts. The following are the lists of five collocates for the three English adjectives, using a measure of strength of association called log-log scores, based on the British National Corpus:

<i>clever</i> + noun	<i>intelligent</i> + noun	<i>wise</i> + noun
1) girl	1) being	1) precaution
2) boy	2) man	2) man
3) trick	3) network	3) counsel
4) man	4) people	4) decision
5) idea	5) woman	5) woman

A comparison between the synonyms shows that the word *clever* tends to collocate with younger people (e.g., *girl* and *boy*) and that it also has some connotations of being slightly dishonest (e.g., *trick*). The word *intelligent*, on the other hand, can collocate with people in general who have a high level of mental ability and also systems that can work like human beings. The word *wise* typically collocates with actions such as *precaution* or *decision*, implying good, sensible judgments. Some overlaps among the collocates for the three English synonyms above indicate that there are some meanings shared across the

three, whereas different collocations highlight semantic as well as usage differences among them. A list of collocation patterns alongside summary usage notes will greatly enhance learners' understanding of the usage of the synonyms.

Integration of L2 Vocabulary Learning Strategies

As research into L2 vocabulary learning processes and strategies increases, there is a growing awareness that insights from such research fields should enrich dictionary design. The results of corpus studies show that there are some distinct characteristics in the way vocabulary behaves in language use. For example, the most frequent 100 words will cover approximately 65–7% of spoken data, and in most texts around 80% or more of the words are from the most frequent 2,000 word families. In casual conversation, over 90% of the words tend to be from this range of words (Nation, 2008). Therefore, it would be useful for learners to be aware of the relative importance of the words that they encounter in a dictionary.

Editors of bilingual learners' dictionaries have begun integrating information on the degree of relative communicative utility of lexical items into their dictionary designs. In the *Ace Crown English–Japanese Dictionary* (Tono, 2008), for example, two-page special columns called "Focus Pages" are prepared for the most frequent 100 headwords, representing 25 major lexical verbs and function words (auxiliaries, prepositions, conjunctions, and *wh*-words). Each special column focuses on essential information about a headword, such as its core image (usually accompanied by illustrations), meaning maps (semantic relationship among the senses), corpus-based information such as the most salient syntactic patterns, collocation patterns, and some illustrative examples from English textbook corpora as well as native speaker corpora. While this kind of information has been available sporadically in monolingual learners' dictionaries, few highlight the features in a comprehensible manner in order to encourage users to acquire deep vocabulary knowledge for these entries. The *Ace Crown* takes special care to focus on verb patterns, polysemous entries, and collocation knowledge, which are all supplied with corpus frequency ranking information. Learners can visually see how much knowledge has to be acquired to have productive knowledge of the given headword.

The dictionary also shows clear distinctions between the most frequent 2,000 words and the next top 3,000 words, whose entries are marked in asterisks and in red. Additional information useful for productive purposes is supplied for the top 2,000 words, while the entries for the next 3,000 most frequent words show essential information for receptive purposes only. All the rest of the approximately 50,000 entries have Japanese translation equivalents only, which is meant to communicate to users that those are the words that they do not have to memorize or learn in depth, but can look up in a dictionary whenever they are encountered. This kind of distinction between active and passive vocabulary has not been clearly made in learners' dictionaries until recently, because dictionaries serve multiple purposes for multiple groups of users. However, if the target user group is clear, learners' dictionaries should support the vocabulary learning process of users, and specify exactly what vocabulary knowledge users need for that level, and for what purpose.

User Needs/Skills Research

User needs/skills research is also an important area in lexicography. Dictionaries are the primary (and sometimes only) tools that learners turn to to solve almost every language difficulty, and thus should ideally be a comprehensive, one-stop resource. In reality, however, it is impossible to predict all the questions that users will ask of their dictionary, so we need to take a pragmatic view: "A realistic goal is to meet the needs of most users most of the time" (Atkins & Rundell, 2008, p. 32). Recently, lexicography across languages has gone

in two different directions. One is to aim at inclusiveness, providing “everything” that potential users might look for. Online dictionary sites like Eijiro or WordReference.com are such cases. They do not gear their contents toward specific types of users. Instead, they include as much information as possible, not only lexicographical but also encyclopedic and sociolinguistic, and it is up to the users to get what they want. Since there is virtually no space limit, owing to the use of digital technology, this trend will continue until somebody questions the value of such masses of information and restructures the information categories.

Another direction is to make dictionaries more and more specialized. This is again linked to the development of the Internet, and a most striking difference from 10 years ago is that nowadays more and more free terminological dictionary sites are available. The GLOSSARIST portal site (www.glossarist.com) has more than 20,000 glossaries and topical dictionaries (both monolingual and bilingual), many of which are developed by professionals or translators working in that particular field. The problem is that they are mainly compiled for professional reference or research purposes, and are usually neither systematic nor exhaustive. Thus, from a user perspective, there must be some kind of criteria for evaluating and filtering those sites. It might be useful to establish a consortium to recommend a list of evaluation criteria to guide the creation of such sites in order to standardize some of the information contents. Despite their varied nature, such specialized sites are updated constantly, and new terms are added quickly, so they are invaluable resources for those who know what to look for.

Conclusion

Increasing numbers and types of bilingual and multilingual dictionary have become widely available since the development of the Internet. It might be good to exploit the power of Internet social networking tools to allow everyone to get involved in dictionary making (see, for example, an early attempt by Cobb, 1999). However, as is the case with wiki lexicographers, this needs careful quality control. Having said that, in theory, the transfer of information across languages has inherent linguistic and cultural difficulties, which will never be perfectly solved even in the Internet age. It is hoped that multimodal and multimedia presentations of dictionary contents and the combination of several layers of information from different dictionary sources might improve the situation. In particular, an encoding or production dictionary that allows users to start from the source language and end up producing the target language correctly and accurately for the task at hand is still an unrealized goal. This is one of the least researched areas, and awaits further investigation and actual products.

Lexicography in Non-European Languages

D. J. PRINSLOO

Introduction

Lexicography in non-European languages presents interesting challenges, some of which are illustrated in this overview of dictionary compilation for the Bantu languages, mainly from a South African perspective but equally applicable to Bantu lexicography on the continent of Africa as a whole. The focus will be on corpora, lexicographic traditions, lemmatization strategies, lemmatization approaches, and the influence of trends and changes in practical and theoretical lexicography on Bantu lexicography. It will be argued that Bantu-language lexicography reflects a complex interplay of factors ranging from finance, infrastructure, skills, and dictionary culture to problematic aspects of lemmatization (the selection of headwords).

The Bantu Languages

The Bantu languages are spoken in the entire southern half of Africa, from Cameroon, Congo, Uganda, and Kenya southward to South Africa. Maho (1999, p. 18), with reference to Hinnebusch (1989), estimates the total number of Bantu languages at between 300 and 600. Bantu languages have a common structure (Guthrie, 1970) and are characterized by a number of salient features, such as a nominal class system according to which nouns are subclassified into different noun classes.

Dictionaries and Dictionary Users

Generally speaking, the availability of dictionaries for Bantu languages varies from none for a specific language to one or more and even several which are unfortunately often outdated or out of print. Furthermore, Gouws (1990, p. 55) points out that the majority of these dictionaries do not reflect a high lexicographic achievement. Gouws (2007, p. 314), however, says that a shift has taken place from externally motivated compilation of dictionaries, for example by missionaries, to an internal drive by mother-tongue speakers of the languages to take responsibility for the compilation of dictionaries. Sincere efforts are made to improve the quality of dictionaries through entrepreneurial efforts and also through governmental initiatives. As far as the latter are concerned, South Africa has 11 government-funded National Lexicography Units, one for each of its 11 official languages, of which 9 are Bantu languages.

For the whole of Africa, it can be argued that the speakers of Bantu languages generally lack a dictionary culture. Atkins (1998, p. 3) remarks: "The speakers of African languages have not in their formative years had access to dictionaries of the richness and complexity of those currently available for European languages. They have not had the chance to internalize the structure and objectives of a good dictionary, monolingual, bilingual or

Figure 1 Toward the perfect dictionary and the ideal user (Gouws & Prinsloo, 2005, p. 42)

trilingual.” Thus in principle the challenge is on the one hand to improve the dictionaries and on the other to improve the dictionary users. Gouws and Prinsloo (2005) summarize the ultimate goal as the urge to compile ideal dictionaries for ideal users, as schematically illustrated in Figure 1.

Traditional Approach

What is referred to, for lack of a better term, as the traditional approach is a situation in which a dictionary compiler adds words to the dictionary as he or she encounters them. Snyman (1990) honestly admits that words can be absent from a dictionary simply because they did not cross the compiler’s path. The traditional approach obviously calls for some kind of selection strategy for inclusion or omission of lemmas (headwords) in dictionaries. De Schryver and Prinsloo (2000a) highlight a number of inconsistencies in Bantu dictionaries resulting from the lack of a proper selection strategy in dictionaries compiled in the traditional way.

Paradigm Approach

Bantu verbs are characterized by numerous verbal derivations resulting from hundreds of possible combinations of the verbal root with one or more suffixes. Dictionaries such as Ziervogel and Mokgokong’s (1985) *Comprehensive Northern Sotho Dictionary* are known for their laborious efforts to enter all of these derived forms, which can, in Van Wyk’s terms (1995, p. 87), number more than 4,000 for a single verb stem. Compare a selection from the *Comprehensive Northern Sotho Dictionary* for the verb *gorulla* ‘lick out completely’ in (1). This approach is referred to by critics as the *enter-them-all-syndrome*.

- (1) (–gorullêla, –gorullêtše, –gorullêlwa, –gorullétšwe) appl.; kgórúllelo, (n–)/di–(kgorullêllô) man. dev.; mogórúlleli, ba–(mogorullêli) pers. dev.; GÓRÚLLELANA (–gorullêlana, –gorullêlane, –gorullêlanwa, –gorullêlanwe) appl. rec.; bagórúllelani (bagorullêlani) pers. dev.; kgórúllelano, (n–/di–(kgorullêlanô) man. dev.; GÓRÚLLI ŠA (–gorulliša, –gorullišitšê, –gorullišwa, –gorullišitšwê) caus.; kgórúllišo, (n–)/di–(kgorullišô) man. dev.; mogórúlliši, ba– pers. dev.

Rule-Oriented Approach

Probably in reaction to the deficiencies in the paradigm approach, dictionary compilers such as Van Wyk in *Pukuntšu* (Kriel & Van Wyk, 1989) followed a so-called *rule-oriented* approach by deliberately limiting lemmatization, especially the treatment (process of giving information such as meaning) of derivations. This was done by lemmatizing stem forms only, and by giving sets of derivation rules which, if applied correctly, should at least guide the user to the stem form from where he or she can start the process of finding the meaning of the derived word. Compare a typical look-up rule for a noun and a verb.

	Begin on:	Look up under:	Example:	Under:
Noun:	<i>ba-</i>	<i>mo-</i>	<i>banna</i>	<i>monna</i>
Verb:	<i>ik-/nk-</i>	<i>k-</i> or vowel after <i>k-</i>	<i>ikagela/nkagela</i>	<i>aga</i>

Corpus-Based Approach

An electronic corpus is a collection of texts, for example millions of words from newspaper texts or a number of books, available in electronic format, that can be manipulated by so-called corpus query programs such as WordSmith Tools (Scott, 1999). The corpus era dawned upon Bantu-language lexicography at a time when dictionary compilation for most Bantu languages was still in its infancy. For the Bantu-language lexicographer this was yet another factor that had to be considered as an aid to creating better dictionaries. De Schryver and Prinsloo (2000a, 2000b) give detailed discussions on how the utilization of electronic corpora can enhance the quality of dictionary compilation. They argue that frequency lists calculated from corpora can prevent the accidental omission of words most likely to be looked for by the user of the dictionary. On the other hand, such lists can help the lexicographer decide on the omission of lemmas that are unlikely to be looked for by the target users, for example in the process of revising an existing dictionary. Corpora are indispensable as an aid to sense distinction, selection of examples, collocations, idioms, proverbs, and so forth, through the study of key words in context, commonly referred to as concordance lines. Table 1 gives concordance lines for the Sepedi verb *gagaba* ‘crawl, sail’.

Table 1 Concordance lines for *gagaba* ‘crawl, sail’

o bona selo se sesehla se	<i>gagaba</i>	go tšwa ngwakwaneng wa wona, mme se so
alosa ka moka ditaba go tloga mathomong a	<i>gagaba</i>	natšo ka lenaneo go fihla go tša lehono.
be di robega mekolo – go sepela e le go	<i>gagaba</i>	fase ka dimpa. Hee, go bona motho mmele
Go go kgala ke seo se ntokedego, Go	<i>gagaba</i>	ka mpa se makale Ke kotlo
e fetile kgauswi le Kgarebo le Motšhitšhi e	<i>gagaba</i>	ka lebelo. Ba e lebeletše go fihlela

Stem Versus Word Tradition

Bantu languages reflect two orthographic traditions: a conjunctive way of writing words and a disjunctive way. The Sotho languages have a very disjunctive way of writing—that is, words and concords are written separately, as in (2a)—while the Nguni languages, such as isiZulu, isiXhosa, and Siswati, have a conjunctive orthography—that is, writing linguistic units as words, as in (2b).

- (2) a. **Sepedi:** Ba a di reka
 b. **IsiZulu:** Bayazithenga
- | | | | |
|----|----|----|--------|
| Ba | a | di | reka |
| Ba | ya | zi | thenga |
- Subject concord Class 2 Present tense marker Object concord Class 10 Verb stem

A word tradition of lemmatization developed for the disjunctively written languages and a stem tradition for the conjunctively written ones. A perception that stem lemmatization is somewhat superior to word lemmatization has resulted in a number of dictionaries of disjunctively written languages also being compiled on a stem principle. Van Wyk (1995) strongly condemns this perception and is supported by Prinsloo and De Schryver (1999) and Gouws and Prinsloo (2005), who point out that the stem approach is not only user-unfriendly but also unnecessarily introduces difficulties regarding stem identification in disjunctively written languages.

Lemmatization Strategies

There is no tension between the stem and word traditions in respect of the lemmatization of verbs. Lexicographers of conjunctively as well as disjunctively written languages agree that stem lemmatization is the best option. Tension, however, does exist between the word and the stem traditions in respect of the lemmatization of nouns.

Lemmatizing Noun Stems

Lemmatizing noun stems requires identification of the stem, which in many cases can be problematic to the user. So, for example, the user who wants to look up the isiZulu word *njengomuntu* 'like a human being' will have to identify the stem *-ntu* before being able to look it up in a stem dictionary.

Lemmatizing Singular Noun Forms

Lemmatizing only singular forms of nouns substantially combats redundancy but is heavily dependent on the application of sets of rules to enable users to look up plural forms of nouns, by first changing them to the singular and then looking up the meaning of the singular forms. This is problematic to inexperienced users because the rules do not always apply straightforwardly.

Lemmatizing Singular and Plural Noun Forms

Lemmatizing singular and plural forms is user-friendly, especially for the inexperienced learners. However, redundancy becomes a factor, especially in dictionaries that offer treatment of both the singular and plural form.

Rulers Designed From Corpora

Prinsloo and De Schryver (2002, 2005, 2007) and Prinsloo (2004) have designed so-called lexicographic rulers from alphabetical lists generated from corpora for the regulation and measurement of alphabetical stretches. These rulers are designed according to the generally accepted fact that the numbers of lemmas in different alphabetical categories are not the same. In English dictionaries many words are treated in the categories A, B, D, M, R, C, and S, while categories, such as J, K, Q, U, V, X, Y, and Z are relatively small, and fill only

Figure 2 A ruler for Setswana

a few pages in the dictionary. In Setswana roughly 17% of all words fall under the single category M, while categories such as (C), J, (Q), U, V, W, X, Y, and Z are virtually empty. Consider the ruler for Setswana reflecting the balance between alphabetical categories in Figure 2.

Developments in Theoretical Lexicography

Bantu-language dictionary compilation has also been influenced by developments in theoretical lexicography. The emphasis on the user perspective, especially on the compilation of very user-friendly dictionaries, urges the lexicographer not only to include lemmas most likely to be looked for but also to lemmatize them in such a way that the user can easily find them, and finally to present the information in a way that the users can easily understand and use in speech or in creative writing. Modern dictionaries are regarded as good or bad by their users and not as products of linguistic achievement. Three specific eras in the past few decades in respect of lexicographic focus can be distinguished. In the 1970s there was a strong emphasis on the linguistic content of dictionaries, while in the 1980s and 1990s the focus was more on the structure of dictionaries, and currently the focus is on the specific functions that a dictionary has to fulfill.

Dictionary Writing Systems

The computer era enabled dictionary compilers in Africa not only to store data collections electronically but also to use computers for the actual compilation of dictionaries. Word-processing software such as Microsoft Word or open-source word processors is widely used. Dictionary writing systems such as IDM and TLex offer more sophisticated tools for dictionary compilation, and the use of TLex especially is rapidly increasing in Africa.

Affordability of Bantu-Language Dictionaries

Affordability of dictionaries is a major problem in Africa. Dictionaries are caught up in a triangulation of number of lemmas versus exhaustiveness of treatment versus price. The compiler can include either a large number (e.g., 20,000–30,000) of lemmas with limited (e.g., 1–2 lines double column) treatment, or a limited number (e.g., 10,000) of lemmas with more exhaustive (e.g., 5–7 lines) treatment. The suggested price of the dictionary should not exceed R100 (€10 or US\$15). This has serious implications for users who want to use their dictionaries to produce speech and texts in Bantu or in English. A dictionary containing only 5,000 lemmas on the English–Sepedi and 5,000 lemmas on the Sepedi–English side is in principle suitable for productive use, but the user is frustrated by not finding words that occur with a lower frequency.

Electronic Dictionaries

As in the case of corpora, it could also be argued that the electronic era dawned upon Bantu-language lexicography at a time when the goal of compiling dictionaries of a high lexicographic standard had not been attained. In many cases, answering the call for electronic dictionaries resulted in “putting paper dictionaries on computer” instead of designing true electronic dictionaries in their own right. Internet searches for online dictionaries of Bantu languages reflect quite a number that vary greatly in terms of scope, size, information provided, exhaustiveness of treatment, lemmatization strategies, access structures, and degrees of the utilization of true electronic features. A major shortcoming in most of the dictionaries is that they are very small and often offer not much more than translated word lists. Not much progress has been made in terms of the utilization of the virtues of the electronic medium, such as the great capacity and speed characteristic of electronic products, combined with enhanced query and data-retrieval technology. And not much is exhibited in terms of innovative features characteristic of online dictionaries for the major languages of the world such as English, German, and French, for example pop-up access, bringing together of related items, new routes to the data, less dependency on alphabetical order, fuzzy spelling, intelligent extrapolation of characters keyed in, audible pronunciation, and so forth.

New Approaches to the Compilation of Bantu Dictionaries

A number of innovative approaches to dictionary compilation for Bantu languages exist, of which two will briefly be discussed.

An Unbalanced, Balanced Design for an English–Setswana Dictionary

A new English and Setswana dictionary design for learners with mother-tongue Setswana who wish to empower themselves in English aims at guidance on text and speech production in English and reception (understanding) of English text and speech. Taken at face value, this dictionary is unbalanced, in the sense that it has 15,000 English lemmas with relatively short treatment of each lemma in the English–Setswana side but only 10,000 Setswana lemmas on the Setswana–English side. The Setswana lemmas are, however, extensively treated. Both sections of the dictionary help the target users to empower themselves in English. Given the high number of English lemmas on the English–Setswana side, the users are likely to find the English words that they do not know the meaning of. As for producing their own texts, they find detailed information in the Setswana–English side on how to speak and write in English. The smaller number of Setswana lemmas, but with more exhaustive treatment, in the first section of the dictionary balances out in terms of number of pages with the second section, where more English lemmas are included but with more limited treatment. Furthermore, 10,000 Setswana lemmas cover more than 90% of the Setswana language and 15,000 lemmas roughly 95% of English—thus near equality of coverage, irrespective of a 33% difference in the number of lemmas, is achieved. So a fairly balanced end product results from an imbalanced design.

Dictionaries With Amalgamated Lemma Lists for Bantu

The concept of a single amalgamated lemma list for a dictionary of Afrikaans and Dutch (Martin & Gouws, 2000) inspired a viability study for amalgamated lemma lists for the three Sotho languages and the four Nguni languages. Prinsloo (2006) performed a viability study for a Sotho dictionary with an amalgamated lemma list for Sepedi, Setswana, and

Sesotho. Consider the following sample entries according to this new design (Prinsloo, 2006, p. 202).

rain *n.* pula
motho *n.* a person, a human being
his *pp.* gagwe [SsL/Set]_r hae [Ses]
live *v.* phela [Ses/SsL]_r tshela [Set] ~ **(survive)** phela [Set]

The lemmas *rain* and *motho* as well as their translations are identical and a single entry is therefore sufficient for all three languages. The lemma *his* is translated as *gagwe* in Sepedi and Setswana but as *hae* in Sesotho—thus they are marked as such with the subscripts [SsL/Set] and [Ses] respectively. A similar initiative has been undertaken for a Nguni dictionary.

Future Prospects

Bantu-language lexicography should persevere in the compilation of dictionaries of a high lexicographic standard. Sincere efforts should be made to establish a stronger dictionary culture and training in dictionary-using skills. Compilers should be sensitive to developments in lexicography in the rest of the world, especially in respect of the development of sophisticated lexicographic tools and software such as rulers, Word Sketches (Kilgarrieff, Rychlý, Smrz, & Tugwell, 2004), Wordnets, Framenet, GDEX, and so forth. Probably the most exciting recent innovation is the Dante project (Convery et al., 2010), which, in the terms of its self-description, offers “a comprehensive launchpad for bilingual dictionaries with English as the source language.” It is “a resource for improved word sense disambiguation, the creation or enhancement of online lexicons, and other uses in software applications such as machine assisted translation, information retrieval systems, etc.” (Convery et al., 2010, p. 293).

Bantu lexicography should also maximally utilize the major strengths of the electronic medium, such as speed and data-storage capacity, enabling the design and use of true electronic features and enhanced access structures. These features should be used to solve problems that cannot be solved in paper dictionaries. Most of these problems are rooted in the complicated grammatical structure of the Bantu languages and are related to difficulties in respect of stem identification of words.

It is expected that the future power of corpora for lexicographic purposes will lie in the existence of advanced corpus query programs capable of processing vast quantities of data and of rendering user-friendly outputs. It is believed that the contribution of the corpus of the future depends on the extent to which *comprehensive behavioral patterns of words* can be studied, compiled, and presented to lexicographers in a condensed but user-friendly, machine-readable format.

Conclusion

From the previous discussion it is clear that Bantu lexicography has a long way to go to be on a par with, for example, European or American lexicography in terms of the quality of dictionaries and the sophistication of their users. Bantu-language lexicography not only has to develop from dictionaries of low lexicographic achievement to a high lexicographic standard, it also has to consider all the influencing factors and developments in general lexicography, as well as solving its own unique problems in terms of lexicographic traditions, lack of standardization, and lemmatization. It also has to adapt to the electronic era in a timely way. Best practices have to be combined in the compilation of dictionaries.

Lexicostatistics and Glottochronology

APRIL MCMAHON AND ROBERT MCMAHON

Lexicostatistics and glottochronology are connected methods which use vocabulary to make historical inferences about relationships between languages. Although some authors, for example Campbell (2004, p. 201) and Fox (1995, pp. 279–80), suggest that these terms designate the same method, others, like Millar (2007, p. 459), Embleton (2000, p. 145), Joseph and Janda (2003, p. 173), and McMahon and McMahon (2005, pp. 178–9), argue that it is vital to keep the two separate, for two reasons. First, while lexicostatistics and glottochronology start from the same data, glottochronology makes additional hypotheses about the dating of earlier stages of languages. Second, lexicostatistics has been shown to be reliable and helpful in some circumstances, whereas there are serious challenges to glottochronology, so grouping them together risks rejecting a good method by association with a bad one. We therefore consider lexicostatistics first and independently, and then move on to glottochronology as a possible (and problematic) application of lexicostatistics.

Lexicostatistics as it has normally been practiced is not exactly statistical, but it is based on counting, and provides a numerical estimate of the relative similarity of languages or varieties. Technically, any quantitative method working with words could properly be called lexicostatistics, including methods used to detect relatedness between languages. However, the best-known investigations bearing this name have involved languages which are already known to be related, where linguists are trying to construct or support sub-groups within a family tree.

Lexicostatistics is most commonly linked with Morris Swadesh's construction of basic vocabulary lists in the 1950s (Swadesh, 1952, 1955). Swadesh's meaning lists, typically found in 100- and 200-item versions, were intended to include a range of concepts common to all human societies which are learned early in a family setting and used frequently. These factors mean basic vocabulary is relatively resistant to replacement by borrowing, and hence arguably provides a stable and reliable indicator of the family affiliation of a language, even when its speakers have been in extensive contact with other groups. Basic vocabulary is not immune to borrowing—Embleton (1986, p. 141) finds 12 loans from French into English and 19 from Danish into Faroese for the Swadesh 200-meaning list. However, borrowing is likely to occur at a lower rate in these more "protected" areas of the lexicon, involving for instance names for body parts, small numerals, personal pronouns, kinship terms, simple verbs, and core color terms. McMahon and McMahon (2005, pp. 36–9) provide a history and overview of Swadesh lists, and the 100-word list is given here for illustration in Table 1.

Classical lexicostatistical methodology starts by choosing a basic vocabulary list: This means weighing up the relative advantages of more information in the 200-meaning list against the greater chances of borrowing where the list is longer. For example, Kessler (2001, p. 70) suggests that German and English share 74% cognates over the 100-word list but 59% over the 200-word list; for French and Latin, the figures are 66% versus 56%, and for German and Latin, 38% versus 29%. It must be remembered that historical linguists do not always have much choice about their data. If we are working with modern languages, we can go out and ask speakers; if we have plentiful written texts, we can construct corpora and provide convincing evidence that the item we are slotting into a meaning list

Table 1 The Swadesh 100-item list

all	ashes	bark	belly	big
bird	bite	black	blood	bone
breast	burn	claw	cloud	cold
come	die	dog	drink	dry
ear	earth	eat	egg	eye
fat	feather	fire	fish	fly
foot	full	give	good	green
hair	hand	head	hear	heart
horn	I	kill	knee	know
leaf	lie	liver	long	louse
man	many	meat	moon	mountain
mouth	name	neck	new	night
nose	not	one	person	rain
red	road	root	round	sand
say	see	seed	sit	skin
sleep	small	smoke	stand	star
stone	sun	swim	tail	that
this	thou	tongue	tooth	tree
two	walk	warm	water	we
what	white	who	woman	yellow

is the appropriate one. However, if all we have for a language no longer spoken is a series of short inscriptions, or a few place- and personal names, then our list for comparison will necessarily be short, and selected by circumstances beyond our control.

Once we have provided a normal, everyday equivalent for the meaning at a particular slot in the list (so, *dog* rather than *hound* for the meaning ‘dog’, even if including *hound* might be ever so tempting given its similarity to German *Hund*), the next step is to determine which of the languages under comparison share cognates, or words descended from a common ancestral root. Thus, for the ‘dog’ slot, comparing German *hound* and Dutch *hond* will score one point; similarly, French *chien* is cognate with Italian *cane*; but there will be a score of zero for Dutch compared with Italian, or French with German, or English ‘dog’ with any of the above. The same comparison, assessing where there are cognates, is then conducted for the whole list. For every pair of languages in the analysis a lexicostatistical percentage can then be calculated as the number of slots with shared cognate items relative to the number of filled slots in both lists. Using this method we can identify, or confirm, a Romance branch within Indo-European, containing French and Italian; and a Germanic branch containing German, Dutch, and English, within which German and Dutch are closer to one another than either is to English.

Lexicostatistics, however, is not without its difficulties. First, what historical linguists really need, arguably, is less a way of sorting out relative closeness of relationship, where relatedness itself is already fairly clear, than a method that can evaluate how likely two languages are to be related at all. Any method based on cognates requires a prior assessment of which items actually are cognate; this in turn means lexicostatistics is based on the comparative method (Durie & Ross, 1996; Harrison, 2003; McMahon & McMahon, 2005, 1.2). Any concerns over the validity of that method will in turn apply to lexicostatistics.

Furthermore, there are objections to focusing only on the vocabulary, as lexicostatistics clearly does, rather than taking an overview of data from different levels of the grammar, as this may give only a partial picture of the language. There are also challenges to the

concept of a universal basic vocabulary list—Swadesh himself (1952, p. 457) accepted that “it would be impossible to devise a list which works perfectly for all languages.” If only a small number of items in a large list do not work for a particular language, then omitting these will not do substantial damage; but there have been suggestions of broader difficulties. For instance, where there are several translation equivalents, there is no very clear guidance (beyond opting for a normal, everyday word) to help us decide which to choose; and both *little* and *small* in English are quite normal, everyday words and could fill the same slot in the Swadesh list. Lack of universality might also argue for variant lists appropriate for different parts of the linguistic world: amended lists are proposed by Matisoff (1978, 2000) for Southeast Asia, by McMahon, Heggarty, McMahon, & Slaska (2005) for the Andes, and by Alpher and Nash (1999) for Australia. The choice is between having lists which are more reliable for a specific area, and allowing maximum comparability across all the languages of the world.

Finally, we face a difficulty discussed in detail by McMahon and McMahon (2005) and McMahon et al. (2005), namely that languages may appear to share cognates which in fact reflect historical borrowing from one of those languages (or its relative) into the other. This is not in itself a flaw in lexicostatistics, but does require us to work toward reliable methods for detecting borrowings, which can then be removed from consideration without skewing results.

Lexicostatistics has been used fairly widely (though it is by no means universally accepted—see Dixon, 1997, pp. 35–6) and continues to be developed (see Starostin, 2000, and for a historical perspective, Embleton, 2000). However, its derivative, glottochronology, a focus of research during the 1950s and 1960s, has subsequently been substantially discredited. Glottochronology begins where lexicostatistics stops, namely with a calculation of similarity based on a particular cognate list. In lexicostatistics, higher scores for comparisons over the same list argue for grouping languages together into subfamilies, and therefore support particular family trees. However, glottochronology seeks not only to construct such trees, but to put dates on the branching points; not only to provide some evidence for German and Dutch having come from a common ancestor more recently than the one they both share with English, but to date the point when that common ancestor stopped being a single protolanguage, and began being German and Dutch respectively.

There are many problematic assumptions even in this initial description, not least the idea that languages diverge suddenly, rather than slowly drifting apart over what might be centuries of continued contact and intermingling. One can certainly understand the interest in providing dates for family trees, which allows comparison between language data and evidence from other disciplines. Swadesh (1950, 1955, 1971) and Lees (1953) take their cue from the development of carbon-14 dating in archaeology, where the gradual reduction of radioactive carbon 14 relative to normal carbon in organic material can be modeled by a decay equation; this allows a date to be proposed for the time when the organic material (whether plant or animal) was alive. The key, however, is that carbon 14 decays at a constant rate; and this idea only transfers to historical linguistics successfully if we can identify an aspect of language which also does so. Swadesh and Lees assumed that this is true of basic vocabulary, and proposed an equation deriving the time depth in millennia since two languages separated from the percentage of remaining cognates and the “glottochronological constant.” This constant, of 81% cognate retention per millennium, was defined by Lees (1953) through a comparison of 13 pairs of control languages (though Swadesh modified this to 86% for the 100-meaning list). Using Swadesh’s modified calculation, a pair of languages sharing 70% cognates diverged around 1,180 years ago, while 20% remaining cognates would signal divergence about 5,560 years ago.

Glottochronology has been much discussed (for general overviews see Fox, 1995; Campbell, 2004; McMahon & McMahon, 2005, chap. 7; Millar, 2007), but the main problem

is that, when we compare its results to dates from known historical events, it simply does not work. We calculate dates for the divergence of Italian and French of AD 1586, and of 1575 for German and Dutch, for example. Bergsland and Vogt (1962) demonstrate that Old Norse and Modern Icelandic, with 96% cognates, should have split only 258 years ago, while East Greenlandic Eskimo has a much higher turnover of vocabulary because of taboo, and would be estimated as having a much longer history. These difficulties rest on the assumption that any element of language changes at a constant rate, independent of social factors: In fact, by far the largest role in determining rates of change appears to rest with factors as difficult to measure as speaker attitudes, relative conservativeness of societies, and prevalence of contact.

The idea of developing methods for dating splits in family trees, glottochronology itself aside, remains attractive, though still debated. For example, Gray and Atkinson (2003) tested alternative datings for Proto-Indo-European using the Bayesian Markov chain Monte-Carlo simulation method recently developed in biological phylogenetics. This probability-based approach smoothes out variation in rates down individual language branches in order to generate a family of trees and can provide robust, if approximate, dating for the language family and its sub-branches, although not for individual languages. On the other hand, McMahon and McMahon (2006) raise serious concerns for the prospect of developing general dating mechanisms for language, mainly due to the intrinsically unpredictable balance between internally motivated change and contact. Furthermore, recent work by Atkinson, Meade, Venditti, Greenhill, & Pagel (2008) suggests that language change may well proceed in punctuational mode, with more concentrated periods of change around split points; this would argue against any capacity to date through an assumption of temporal regularity of change. (See <http://carlin.lib.ed.ac.uk:2209/cgi/data/319/5863/588/DC1/1> for supplementary material.)

Lexicostatistics, in the meantime, continues to be explored and developed in several ways. One question is whether Swadesh lists can be divided into sublists which might behave somewhat differently, to allow more precise calculation or prediction of patterns of change. For example, McMahon et al. (2005) identify sublists which are more or less susceptible to borrowing, and argue that the effects of contact can therefore be used to improve our understanding of language history, rather than representing an obstacle to comparison. Pagel, Atkinson, and Mead (2007) in turn propose that differential rates of change within a basic vocabulary list reflect the frequency of use of the items in question. There is also a trend toward combining lexical with phonological or morphosyntactic data to test hypotheses of language relatedness, as in recent work on Papuan languages (Dunn, Terrill, Reesink, Foley, & Levinson, 2005; Dunn, Foley, Levinson, Reesink, & Terrill, 2007), though the specific case is problematic (Donohue & Musgrave, 2007). Finally, important innovations relate not only to methodology, but also to constructing databases and making comparable data more readily available, as in the Austronesian Basic Vocabulary Database project (Greenhill, Blust, & Gray 2008; see also <http://language.psy.auckland.ac.nz/austronesian>), which in June 2010 contained material from 664 languages. Developing protocols for sharing data can only assist in testing and comparing methods, which in turn will bring us closer to agreed ways of evaluating the relatedness of languages.

Lexis: Overview

BRENT WOLTER

Lexis is a growing field, and one that has clearly found a permanent place in applied linguistics. If there is a common thread that runs through current thinking in lexical research in applied linguistics, it is that vocabulary can never fully be understood through approaches that view it as isolated words with isolated (and isolatable) meanings. Instead most vocabulary researchers view lexis (which is often used interchangeably with the term vocabulary in the research literature) as interacting with other aspects of language (perhaps most notably grammar) in complex, systematic, and meaningful ways. In fact, it has often been observed that when one approaches language description from a lexical perspective, the division between lexis and grammar breaks down to the point where it becomes difficult to tell where one begins and the other ends. Similarly, words almost always have a non-negligible impact on their lexical environment; the selection of a certain word influences, to a considerable extent, what other words are likely to occur nearby in a given text. Finally (and also relatedly), meanings are fluid; they change based on the lexical environment in which they occur.

Like many other foci of investigation in applied linguistics, the study of lexis has been approached from multiple perspectives and for multiple purposes. Nonetheless, studies investigating lexis can be broadly classified into three main areas. These areas were astutely identified by Norbert Schmitt and Michael McCarthy in their edited volume entitled *Vocabulary: Description, Acquisition, and Pedagogy* (Schmitt & McCarthy, 1997). With some minor modifications, these areas can accommodate the entries in this section as well. It is important to bear in mind, however, that classification of a particular entry in a specific area simply indicates the main focus of the research on that topic to date. Most of the entries included in the lexis section of this encyclopedia could be approached from all three perspectives, and current research in many entries already straddles more than one area.

Description

One of the most historical and fundamental objectives in the study of lexis is identifying what, exactly, words are. This has been the goal of lexicographers, lexicologists, and philosophers for generations, and is captured in the entries on **TRADITIONAL APPROACHES TO MONOLINGUAL LEXICOGRAPHY** and **BILINGUAL LEXICOGRAPHY**. It is also a main goal of **LEXICAL SEMANTICS**, though lexical semanticists make much more explicit links between description and the psychological aspects of word knowledge. Two entries describe more recent approaches to lexicography: the **COBUILD PROJECT**, which explains a corpus-based approach to lexicography, and **WORDNET** which is an electronic dictionary that groups words according to semantic similarity. The **TERM BANKS** entry explains the practical application of lexicography in business, industry, and other commercial ventures, while the entry on **ONOMASTICS** explains the history and origin of proper names. Two entries present brief accounts of highly influential figures in lexicography. These include the entry on **JOHNSON, SAMUEL AND LEXICOGRAPHY** and the entry on **WEBSTER AND AMERICAN LEXICOGRAPHY**. In **COMPOUND WORDS** the author explains the phenomenon of lexical compounding, whereas

2 LEXIS: OVERVIEW

the entry on **LEXICAL GAPS** explains the phenomenon of nonwords in a language. **LEXICAL BORROWING** explains the process by which language users borrow vocabulary from other languages.

Other entries in this section are dedicated to explaining how lexis functions above and beyond its traditional classification as semantic meaning to incorporate a variety of aspects. These include the entry on **DEPTH OF VOCABULARY KNOWLEDGE**, which outlines current work developing from Nation's (1990, 2001) highly influential descriptions of what it means to "know" a word, and the entry on **FORMULAIC SEQUENCES**, which arguably comprises the most comprehensive account to date of how language systems might emerge primarily from lexically based input. It also includes the entry on **LEXICAL COLLOCATIONS** which provides accounts for the phenomenon by which conventionalized multiword strings come to take on a single meaning. This, as it turns out, was one of the most important early observations that led to the emergence of lexis as a main area of research in applied linguistics (e.g., Firth, 1957; Halliday, 1966; Sinclair, 1991).

The remaining entries in this section are on lexical erosion, lexicostatistics and glottochronology, and Zipf's law and vocabulary. **LEXICAL EROSION** explains the mechanisms underlying (and implications of) language loss. **LEXICOSTATISTICS AND GLOTTOCHRONOLOGY** explains two vocabulary-based methodologies used by historical linguists to make assumptions about the relatedness of languages. Finally, in **ZIPF'S LAW AND VOCABULARY** the author discusses the observations that were brought to light by George Zipf regarding the dynamics existing between a word's rank in a text and the word's frequency.

Teaching, Learning, and Assessment

The entries in this section are concerned with a wide range of practical aspects regarding the teaching, learning, and assessment of vocabulary. Two in particular, **APPROACHES TO SECOND LANGUAGE VOCABULARY TEACHING** and **MYTHS ABOUT VOCABULARY LEARNING**, discuss current and historic pedagogical approaches to vocabulary. The **LEXICAL SYLLABUS** entry looks specifically at one attempt to develop a comprehensive language-teaching program with vocabulary at its core. Three entries discuss the rationale and procedures used to define a particular subset of vocabulary for instructional purposes. These include the entries on **BASIC ENGLISH**, **CORE VOCABULARY**, and **SPECIAL PURPOSES VOCABULARY**.

The second major grouping of entries in this section concerns vocabulary learning. **SECOND LANGUAGE WORD DIFFICULTY** explains what aspects of individual words make them more (or less) difficult to learn. The entries on **VOCABULARY LEARNING STRATEGIES**, **DICTIONARY USE**, and **MNEMONICS** all discuss the means by which learners can improve their ability to gain vocabulary knowledge in a second language. Similarly, the entry on **WEB-BASED LEXICAL RESOURCES** outlines a broad range of current online sources available to learners who wish to enhance their vocabulary skills. The entry on **INCIDENTAL VOCABULARY ACQUISITION** explains the process by which vocabulary learning occurs despite it not being the primary focus of the activity at hand. This phenomenon is further explained in the entry on **VOCABULARY AND READING**, along with a detailed account of the complex (often reciprocal) interplay between vocabulary learning and reading ability.

The last major grouping in this section contains entries that are concerned in some way with vocabulary assessment. The entry entitled **CONVENTIONAL METHODS FOR ASSESSING VOCABULARY** provides a broad overview of the numerous ways in which second language vocabulary knowledge is currently being assessed, both in teaching and research environments. Some of these means of assessment are explained in greater detail in the entries on

LEXICAL FREQUENCY PROFILES and MEASURES OF LEXICAL RICHNESS, both of which discuss analytical tools that can either be used to evaluate learners' productive language use or to evaluate the complexity of existing "real-world" texts. Finally, the entry on MACARTHUR-BATES COMMUNICATIVE DEVELOPMENT INVENTORIES explains vocabulary-based assessment tools for evaluating linguistic development in children.

Acquisition, Access, and Storage

The final grouping consists of entries related to the acquisition, access, and storage of vocabulary knowledge. More briefly, these entries deal with vocabulary at a psychological level. Two entries provide broad overviews: PSYCHOLINGUISTIC APPROACHES TO VOCABULARY discusses the key issues in psycholinguistic research into vocabulary, while BRAIN IMAGING STUDIES AND VOCABULARY summarizes the main findings of the growing body of neurophysiological research into vocabulary. Two complementary entries, FIRST LANGUAGE VOCABULARY ACQUISITION and VOCABULARY ACQUISITION IN BILINGUALS, look at how words are acquired in a first language versus a second language, while the entries on VOCABULARY LOSS IN THE FIRST LANGUAGE and SECOND LANGUAGE VOCABULARY ATTRITION discuss the converse situation.

There are several entries that look in greater detail at finer aspects of acquisition, access, and storage. Two entries discuss how first language vocabulary knowledge influences the acquisition and processing of second language vocabulary: LEXICAL TRANSFER AND FIRST LANGUAGE EFFECTS and COGNATES. From a storage perspective, there are again complementary entries, this time on VOCABULARY SIZE IN THE FIRST LANGUAGE and VOCABULARY SIZE IN A SECOND LANGUAGE. There are also three entries that discuss modeling in psycholinguistic vocabulary research. FORMAL MODELS OF BILINGUAL LEXICONS provides an overview of models of lexical storage and lexical processing, the latter of which is discussed at greater length in the entry on FORMAL MODELS OF BILINGUAL SPEECH PRODUCTION. The third entry that takes modeling as a starting point is on the topic of SPOKEN WORD RECOGNITION.

Finally, there are two entries that deal primarily with methodological aspects of psycholinguistic research into vocabulary. In addition to explaining what word association research can tell us about lexical storage, the entry on WORD ASSOCIATIONS also explains several methodological issues that researchers need to take into account when conducting associational research. The other entry in this grouping describes considerations underlying the creation of IMAGINARY WORDS, which are frequently used in psycholinguistic studies that measure response times to stimuli (such as a lexical decision task).

Conclusion

The entries included in this section represent a broad sampling of the work being done in lexis. In addition to entries dealing with L2 lexical research, efforts were also made to include entries that explain areas of emphasis in L1 research circles. This was done not only in an effort to be comprehensive, but also in an effort to provide an important theoretical backdrop for the current state and scope of L2 lexical research. Though admittedly incomplete, it is hoped that the sampling of entries included in this section will provide researchers and teachers with good entry points into some of the main areas of research in this vast and rapidly expanding field of applied linguistics.

Liaison Interpreting

MARIACHIARA RUSSO

Interpreting is a complex language transfer skill that enables speakers of different languages and cultural backgrounds to communicate orally during what are generally defined as interpreter-mediated events (Alexieva, 1997). Within the framework of interpreting studies a distinction is made between conference interpreting and liaison interpreting.

While conference interpreting is a fairly recent profession (it developed in the early 20th century to meet the needs for consecutive and simultaneous interpreters during multilingual diplomatic negotiations, assemblies of international organizations, and international meetings of experts), liaison interpreting is as old as humankind's first socializing contacts between individuals or neighboring populations speaking different languages. Indeed, the presence of bilingual/bicultural intermediaries has been amply documented in the history of trade, warfare, and religion (Hermann, 1956/2002; Kurz, 1985; Delisle & Woodsworth, 1995). In many countries, however, liaison interpreting is still struggling to be recognized as a full-fledged profession in its own right and to achieve the social or institutional recognition and financial remuneration it deserves. Efforts to enhance the profession and promote theoretical and field research are ongoing as testified by the Critical Link conferences (www.criticallink.org).

The expression "liaison interpreting" refers

to a growing area of interpreting throughout the world: in business settings, where executives from different cultures and languages meet each other; in meetings between a society's legal, medical, educational and welfare institutions and its immigrants who speak a different language; in relations between a dominant society and indigenous peoples speaking different languages; in a whole host of less formal situations in tourism, education and cultural contacts. (Gentile, Ozolins, & Vasilakakos, 1996, p. 1)

In all these settings, the liaison interpreter is physically present and usually sits in a position that facilitates eye contact and direct interaction between the two interlocutors; she or he may also take down short notes in order to deliver her or his translation after each speaker's turn in a dialogue (consecutive mode). Where required, the interpreter can also whisper the translation of the source message into the addressee's ear while the addressor is speaking (*chuchotage* mode). The liaison interpreter translates in two language directions, that is, from a source language A (for instance, English) into a target language B (for instance, Urdu) to convey the speaker's message, and then from the source language B (Urdu) into the target language A (English) to translate the other speaker's reply. The interpreter must therefore have an excellent passive and active knowledge of her or his working language(s) and the relevant specialized terminology, in addition to other nonlinguistic competences described below (see Sandrelli, 2001 for an innovative teaching approach). To help ensure an interpreter-mediated encounter is successful, it is useful to have a preliminary briefing session between the client and the interpreter to discuss the purpose of the meeting and the desired style of interpretation, and to review any materials and terminology that may be used. During this briefing session and in any case before the start of the meeting, the interpreter's role should be made clear (for instance, she or he will

specify that she or he will translate everything that the speakers say and so they should refrain from saying anything that they do not wish to be reported—the transparency principle; NCIHC, 2001).

Given the wide-ranging variety of working environments and geographical distribution of this profession, liaison interpreting is given different labels (Roy, 1993/2002; Mack, 2005), even within the English-speaking world (Gentile et al., 1996). While “liaison interpreting” is normally accepted as the general term for this profession, as opposed to “conference interpreting,” the other terms used are often associated with specific settings. An “ad hoc interpreter” usually refers to someone without formal training who is called upon to interpret (“such as a family member interpreting for her parents, a bilingual staff member pulled away from other duties to interpret, or a self-declared bilingual in a hospital waiting-room”; NCIHC, 2001), while “face-to-face” interpreting stresses the physical presence of a liaison interpreter as opposed to telephone interpreting. Liaison interpreting requested for informal meetings in activities related to trade and tourism is usually referred to as “escort” or “business” interpreting (see, e.g., Pistillo, 2009). The interpreting provided during trials and legal hearings is usually referred to as “court” or “courtroom interpreting” (for a detailed description of the specific features of this profession and its applications see Berk-Seligson, 1990/2002; Mikkelsen, 2000).

“Public service interpreting,” “three-cornered interpreting,” “dialogue interpreting,” “contact interpreting,” and “community interpreting” are all synonyms referring to interpreting provided for social, legal, and health institutions, such as hospitals, medical centers, schools, police stations, immigration offices, and so forth. To avoid any ambiguity, the term “community interpreting” will be used for liaison interpreting between a service provider and a client (where the former is institutionally required to meet the health-care, welfare, or legal needs of the latter).

The field of operation of a community interpreter is defined as follows by Mikkelsen (1996, pp. 126–7, original emphasis): “community interpreters provide services for *residents of a community*, as opposed to diplomats, conference delegates, or professionals traveling abroad to conduct business.” The need for community interpreters, which first arose in countries with long-standing immigration traditions such as Great Britain, Australia, and Canada, is now very great in other countries which have recently become a destination for migrants, such as Italy (Russo & Mack, 2005; Rudvin, 2006; Gavioli, 2009) or Spain (Alonso & Baigorri, 2008; Valero Garcés, 2008; Valero Garcés, Lázaro Gutiérrez, & Pena Díaz, 2008). This increasing demand has spurred the growing professionalization of community interpreters worldwide, with the introduction of training programs (Hale, 2007) and accreditation systems (such as the National Accreditation Authority for Translators and Interpreters [NAATI, www.naati.com.au] in Australia), and the development of professional associations with their own codes of ethics and quality standards (Australian Institute of Interpreters and Translators Incorporated [AUSIT, www.ausit.au], National Register for Public Service Interpreters [NRPSI, www.nrpsi.co.uk], National Association of Judiciary Interpreters and Translators [NAJIT, www.najit.org], Associazione Italiana Traduttori e Interpreti [AITI, www.aiti.org], etc.).

A new professional figure has now emerged in community interpreting: the cultural (and linguistic) mediator or broker, who usually shares the cultural background and immigration experience of the member of the ethnic or linguistic minority she or he is interpreting for (Roy, 2002). According to Wadensjö (1998), the term “mediator” highlights the interpreter’s status as an active participant or co-primary interlocutor and not just a “conduit” (for a discussion on this popular metaphor see Roy, 2002) or messenger. In this respect, the communicative role of linguistic-cultural mediators and community interpreters coincides, but not necessarily their backgrounds. Based on field research and conversation analysis, Wadensjö (1993/2002) highlights a double role of the community interpreter (the

author actually uses the term “dialogue interpreter,” which is its Swedish equivalent, “dialogtolk” or “kontakttolk”; 2002, p. 354): She or he fulfills a relaying role to ensure smooth communication by enabling the two speakers’ messages to be conveyed across different languages, and at the same time plays a coordinating role in the communication flow and promotes the progression of ongoing exchange. Wadensjö uses “dialogue interpreting” to emphasize her focus on “the interpreter-in-interaction,” rather than on “the individual interpreter”: “It has been demonstrated that interpreters’ work is primarily structured by their understanding of the situation, the ongoing activity and its logic, and secondly by the task of translation” (Wadensjö, 2008, p. 184). This holds true for all forms of liaison interpreting. On the one hand, as relayer, she or he produces a whole variety of possible message renditions. On the other hand, the author observed that some dialogue interpreters’ contributions are not meant to convey any propositional content, but bring to the fore her or his coordinating role. Her or his contribution may be a response to the prior speaker (rather than translating for the other interlocutor) or may be an initiative to encourage the other speaker to respond next. Wadensjö (2002, pp. 364–5) suggested the following taxonomy: implicitly coordinating or gatekeeping contributions, and explicitly coordinating contributions. Instances of the first category are all the interpreter’s renditions as relayer: Their greater or lesser faithfulness to the speakers’ original utterances implicitly influences the contents and direction of the communicative exchange. Examples of the second category are: (a) responses to the prior speaker in the form of “requests for clarifications or comments on the substance (or form) of the prior speaker’s contribution” (2002, p. 365)—since these exchanges occur in one language, the other party is momentarily excluded from the conversation; (b) initiatives to elicit information that one of the two speakers may need by encouraging the person addressed to continue talking; and (c) contributions in the form of meta-comments which provide “an explanation of what the other primary party seems to mean, what the other primary party does not understand [due to possible major cultural differences] or what the other primary party is doing or going to do in the interaction” (p. 365).

The community interpreter’s active participation in the communicative interaction (“communicative *pas de trois*”; Wadensjö, 1998) further distinguishes her or him from the conference interpreter, whose visibility and self-projection have only recently been recognized (Straniero Sergio, 1999, 2007; Diriker, 2004). Among the main features that characterize community versus conference interpreting, Angelelli (2000, pp. 582–3) lists

- dialogic mode [conference interpreters mostly interpret monologues];
- equal amount of work into both languages;
- possibility of controlling the traffic flow;
- parties’ participation in the communicative event, which may not be optional (e.g., in the case of a patient [while a member of a conference audience may not necessarily take the floor]);
- maximum potential for different backgrounds between parties;
- maximum potential for linguistic varieties of the same code (in both languages); and
- maximum potential for different registers.

Furthermore, the author provides a thorough sociopragmatic analysis of the differences between their respective communicative situations, based on Hymes’s (1974) theory of communication.

Another comparative overview is offered by Hale (2007, pp. 31–3), where the author highlights the main differences in terms of register, language directionality, proxemics, mode of delivery, consequences of inaccurate rendition, level of accuracy required, participants, and number of interpreters. In addition to the features not previously highlighted,

the following are worth mentioning: The community interpreter's register ranges from the very formal to the very informal; her or his language direction is bidirectional; she or he acts in close proximity to the speakers, which favors interactivity; the mode of interpreting is mainly short consecutive (in dialogues), long consecutive, simultaneous whispering, and sight translation; the consequences of inaccurate renditions are great and so is the level of accuracy required (court and medical interpreting are self-explanatory examples); participants in the events mostly differ in status; and, finally, community interpreters work alone and not in teams.

Another important feature of the communicative situation in which community interpreters are called upon to interpret is the power asymmetry between the interlocutors. This condition does not usually occur either in conference interpreting or in other forms of liaison interpreting, such as escort or business interpreting. In these cases, interlocutors normally enjoy similar social status and expertise and the main asymmetries interpreters face concern interactional patterns, rhetorical conventions, or trading cultures.

In community settings, on the other hand, there is usually a cultural, hierarchical, and institutional gap between the public officials belonging to the establishment of the host country (doctors, police officers, magistrates, etc.) and the members of the minority group involved in the interaction (migrant patients, asylum seekers, foreign offenders, etc.). The "ideal" interpreter is expected to be impartial and neutral (Schweda-Nicholson, 1994): she or he will convey exactly the same meaning as the original utterance with the same degree of formality and respect (relaying role; Wadensjö, 2002) and will refrain from taking sides with either of the two parties. Over the years, a considerable amount of research has been carried out to verify these two basic tenets of ethical conduct in the interpreter's daily practice. Results show that either consciously (due to issues of ethnic, social, political, cultural, or even gender nature; Gentile et al., 1996) or unconsciously (as evidenced, for instance, in health care through the use of a detached or affiliative language when interpreting; Merlini & Favaron, 2007), community interpreters often behave like advocates of the party considered at a disadvantage (in many countries they are actually "supposed to be actively involved in looking after the rights of the 'weaker' party"; Niska, 2002, p. 134).

Community interpreters (and liaison interpreters in general), as social agents, carry values, knowledge, experience, beliefs, and emotions that are inevitably channeled through the interpretation of the communicative interaction. Certain job settings (legal, medical, etc.) may cause severe psychological stress and tensions, even trauma (Baistow, 2000, quoted in Rudvin, 2002). Neutrality is therefore a concept that needs re-contextualizing in light of a "more dynamic, interactional approach which looks at the community interpreter as an active agent in the construction of 'meaning'" (Rudvin, 2002, p. 217).

"Liaison interpreting," a hypernymic term encompassing all the above-indicated forms of non-conference interpreting, best conveys the truly social and human dimension of interpreting, because interpreters are confronted on a daily basis with challenging issues such as power, advocacy, agency, neutrality, conflict, stress management, reconciliation of cross-cultural differences, and bridge-building strategies. These challenges demand professionalism combined with personal sensitivity, sociocultural competence, and excellent interactional skills. In today's multicultural societies the need for qualified liaison interpreters is on the rise and so is the demand for high-quality training programs.

Lightbown, Patsy M.

NINA SPADA

Patsy M. Lightbown is a pioneer in the field of classroom research (CR) on second language (L2) learning and teaching. Her extensive research and publications have had a considerable impact on second language acquisition (SLA) researchers and L2 teachers throughout the world. Her work has not only contributed substantially to the knowledge base in CR, but has served as a model of how to conduct descriptive and quasi-experimental research on classroom SLA. Indeed the intellectual leadership provided by Lightbown has helped to shape the direction of classroom SLA research and has moved the field forward in important and innovative ways.

Born in North Carolina, Lightbown began to learn French in grade 11 and became enthralled with the idea of speaking another language. She went on to complete a BA in French at the University of North Carolina at Greensboro. She spent two years as a public health worker for the US Peace Corps in Niger, West Africa, where she was able to use her French and also learned Hausa. Upon her return to the USA she completed an MAT in French at Yale University and taught French to high school students. In pursuing an MEd in teaching English to speakers of other languages (TESOL) at Columbia University, Teachers College, she came to a crucial turning point in her professional and academic life. She was attending a lecture in first language (L1) acquisition by Lois Bloom, the internationally renowned L1 researcher, and became deeply aware of and fascinated by the complexities and challenges involved in theoretical and empirical work related to language development. This motivated Lightbown to enroll in the PhD program in psycholinguistics at Columbia and, under Bloom's supervision, to begin an apprenticeship as a researcher and scholar in L1 acquisition. At the same time, her experience as an L2 learner and teacher continued to influence the direction of her academic interests and goals. For her PhD thesis she chose to investigate the acquisition of French by both young L1 learners and Anglophone children learning French as an L2. This took her to Montreal, Canada, in 1974 ostensibly for a short period to collect data. For the next 27 years Lightbown remained in Montreal, where she was a professor of applied linguistics at Concordia University. It was during that time that she established herself as one of the world's leading figures in CR in SLA.

Lightbown has produced scores of publications covering a wide range of topics, including but not limited to the role of instruction in SLA, comprehension-based L2 learning, developmental sequences in instructed L2 learning, L2 vocabulary development, two-way bilingual education, developmental readiness and L2 instruction, the role of corrective feedback in classroom L2 learning, the age factor in L2 learning, and L2 learner noticing and awareness. Among her most influential publications are those that discuss the connections between and the relevance of classroom SLA research for L2/foreign language instruction. Two classic examples are her seminal article "Great Expectations: Second Language Acquisition Research and Classroom Teaching," published in 1985 in *Applied Linguistics*, and the update, "Classroom SLA Research and Second Language Teaching," published 15 years later in a special anniversary issue of *Applied Linguistics*. Another notable aspect of Lightbown's publications record is her collaboration with other scholars, including those not directly involved in classroom SLA research. These contributions have brought new

perspectives from related disciplines and provide useful connections between instructed SLA and other theoretical frameworks. Two examples are “The Influence of Linguistic Theories on Language Acquisition Research,” co-authored with Lydia White and published in *Language Learning* in 1987, and “Psycholinguistic Approaches to SLA” co-authored with Norman Segalowitz and published in the *Annual Review of Applied Linguistics* in 1999.

Lightbown has been invited all over the world to speak to researchers, theorists, and pedagogues about her work. The titles of her talks reflect the links she makes between research and classroom practice. A few examples are “What Does Practice Perfect?” “Fair Trade: Two-Way Bilingual Education,” and “Something to Talk About: Content-Based Language Teaching.” In addition to her international recognition as an accomplished researcher and scholar, Lightbown has been recognized as a gifted teacher. This was formally acknowledged in 2001 when she received the Award for Excellence in Teaching at Concordia University. Her success as an instructor is not restricted to teaching courses to graduate and undergraduate students. She has also excelled in mentoring young researchers. Lightbown’s success in obtaining research grants from the Canadian and Quebec governments to carry out large-scale research in English as a second language (ESL) classrooms enabled her to provide a valuable context in which students could develop their research skills. Indeed, several members of the new generation of productive and accomplished scholars in instructed SLA research apprenticed as researchers under her guidance and supervision.

Lightbown is highly regarded as a scholar who communicates with teachers about research in accessible and meaningful ways. Throughout her career she has regularly presented papers at teachers’ conferences—a reflection of her strong commitment to maintaining links between research and practice. For several years she organized an annual “teacher-friendly” research session on classroom L2 learning for Quebec’s ESL teachers association, the Société pour la promotion de l’enseignement de l’anglais, langue seconde au Québec (SPEAQ). In 1988 she was presented with the SPEAQ Award for “contributions which have had an impact on the entire English (second language) teaching community in Quebec.” In a publication intended to make SLA research accessible to classroom teachers Lightbown co-authored *How Languages Are Learned* with Nina Spada in 1993. An expanded and updated third edition was published in 2006. The book provides an introduction to theory and research in L2 learning and relates them to classroom practice. Described as a “sensible book mercifully free of jargon,” *How Languages Are Learned* was awarded the Duke of Edinburgh book prize in applied linguistics in 1994 and continues to be used as the standard text in introductory SLA courses throughout the world.

Lightbown has also made significant contributions to service in the field of applied linguistics. She has been a member on the editorial/advisory boards for the major journals in the field as well as the editor of the *TESL Canada Journal*. She was the president of the American Association for Applied Linguistics in 1999–2000 and has been a consultant to ministries of education, universities, school boards, colleges, and government agencies. As one of the founding researchers in classroom SLA, her work continues to inspire and shape the work of researchers and, in the process, continues to help L2 teachers understand the relationship between that research and their classroom practices.

Limits of Language Revival

GHIL'AD ZUCKERMANN

What is language revival? In the narrow sense, which is used in this entry, it means the attempt to reclaim a language that is no longer spoken as a mother tongue, for example, Hebrew and Kaurna, the latter being an Aboriginal language in Adelaide, South Australia. The broader meaning of language revival covers many “re-”terms in a continuum based on the extent to which the language being revived is native prior to the revival, for example: renewal (e.g., Ngarrindjeri), revitalization (e.g., Walmajarri), restoration, resurrection, resuscitation, reinvigoration, reintroduction, regeneration, revernacularization, rebirth, and renaissance.

Why should people revive no longer spoken languages? Here are two reasons:

1. *Deontological* reason: Some clinically dead tongues, for example, Australian Aboriginal languages, deserve to be revived for historical and humanistic justice, inter alia addressing inequality. We hear again and again “native title” but where is the “native tongue title”? Is *land* more important than *langue* and (cultural) *lens*?
2. *Utilitarian* reason: Revival of sleeping languages can result in personal, mental, educational, economic, and national empowerment, a sense of pride and higher self-esteem of people, some of whom have lost their heritage and purpose in life.

But is language revival really possible? In other words, what are the limits of language revival? Let us consider “Modern Hebrew” (henceforth, Israeli—see Zuckermann, 1999), the most quoted example of a successful language revival. The genetic classification of Israeli has preoccupied scholars since its fin-de-siècle genesis. The still regnant traditional thesis suggests that Israeli is Semitic: Hebrew *revived*. The revisionist antithesis defines Israeli as Indo-European: Yiddish *relexified*, that is, Yiddish, the revivalists’ mother tongue, is the “substratum,” while Hebrew is only a “superstratum” providing the vocabulary (see Horvath & Wexler, 1997). According to Zuckermann’s (2006, 2008a, 2008b, 2009) *mosaic* (rather than *Mosaic*) synthesis, Israeli is a Semito-European, or Eurasian, hybrid, that is, both Semitic (Afro-Asiatic) and (Indo-) European. It is based simultaneously on “sleeping beauty”/“walking dead” Hebrew, “*máame lóshn*” (mother tongue) Yiddish, both being *primary contributors*, and a plethora of other languages spoken by revivalists, for example Russian, Polish, Ladino (Judeo-Spanish), Arabic, German, and English.

It is hard to provide an exact quantification for such a multivariable enterprise but a rough estimate would be that on a subjective 1–10 scale, with 10 being a complete success, the Hebrew revival is at 6 or 7. More specifically, the following continuum approximations are proposed here for the extent to which Israeli can be considered Hebrew:

- mindset/spirit/genius: 1 (i.e., European);
- discourse (communicative tools, speech acts): 1;
- sounds (phonetics and phonology): 2;
- semantics (meaning, associations, connotations, semantic networkings): 3;
- word order (syntax): 3;
- general vocabulary: 5;

2 LIMITS OF LANGUAGE REVIVAL

- word formation: 7;
- verbal conjugations: 9;
- basic vocabulary: 10 (i.e., Hebrew).

Thus, to varying degrees, Israeli differs from Hebrew in almost all components of language. Some elements, however, are more revivable than others. Words and conjugations, for example, are easier to revitalize than intonation, discourse, associations, and connotations.

Was the Hebrew revival then a failure? “Everything is relative!” The Hebrew revival cannot be considered a failure *tout court* because without the zealous, obsessive, enthusiastic efforts of the symbolic father of Israeli, Eliezer Ben-Yehuda (born Perlman) and of teachers, writers, poets, journalists, intellectuals, political figures, linguists, and others—that many other Jews at the time saw as fruitless and pointless—Israelis would have spoken a language (such as English, German, Arabic, and Yiddish) that could hardly be considered Hebrew. To call such a hypothetical language “Hebrew” would have not only been misleading but also wrong. To call today’s Israeli “Hebrew” may be misleading but not wrong: Multiparental Israeli is based on Hebrew as much as it is based on Yiddish. So although the revivalists could not avoid the *subconscious* influence of their mother tongue(s), they did manage at the same time to consciously revive some components of Hebrew.

Had Arabic-speaking Moroccan Jews arrived in Israel before Yiddish-speaking Ashkenazim, and provided that they had similar national ideology and motivation to those of Ben-Yehuda and his collaborators, the language resulting from their hypothetical revival would have been much more Semitic than Israeli.

Hybridity and the Congruence Principle

The factors leading to the partial failure of the Hebrew revival had little to do with a lack of motivation or zealousness, or with economic or political variables, or even with the fact that the revivalists, such as Ben-Yehuda, were not as linguistically sophisticated as contemporary modern linguists. It is simply the case that one cannot negate one’s most recent roots—be they cultural or linguistic—even if one is keen to deny one’s parents’ and grandparents’ (diasporic Yiddish) heritage in search of (Biblical Hebrew) cultural ancientness. It is thus most unlikely that a no longer spoken language can be revived without cross-fertilization from the revivalists’ mother tongue(s). For example, most native Israeli-speakers’ intonation is much more similar to that of Yiddish, the mother tongue of most revivalists, than to that of Arabic or any other language belonging to the Semitic branch of the Afro-Asiatic family (see Zuckermann, 2005).

According to the “congruence principle,” the more revivalists speak contributing languages with a specific linguistic feature, the more likely this feature is to prevail in the emergent language. Based on feature pool statistics, this principle weakens August Schleicher’s famous family tree model in historical linguistics, which often gives the wrong impression that every language has only one parent.

For example, “*má nishmà*,” the common Israeli “What’s up?” greeting, is a calque—loan translation—of the Yiddish phrase “*vos hért zikh*,” usually pronounced *vsértsekh* and literally meaning “What’s heard?” but actually functioning as a common greeting. However, a Romanian-speaking immigrant to Israel might have used “*má nishmà*” because of Romanian “*ce se aude*,” a Polish-speaking Jew because of Polish “*co slychać*,” and a Russian speaker due to Что слышно “*chto slyshno*,” all meaning and functioning the same way.

Similarly, most revivalists spoke languages, mainly Yiddish, that lacked that Semitic pharyngeal gulp ‘*ayin*’ (represented, for instance, by the apostrophe in the Christian—actually Jewish—name Ghil’ad). Naturally, their children—the ones who, in fact, shaped the real

character of Israeli—could not buy the argument “Do as I say, don’t do as I do!” The result is that most Israelis do not have this sound in their speech.

Not only were the revivalists European but their revivalist campaign was inspired by European—for example, Bulgarian—nationalism. At the time, although territory and language were at the heart of European nationalism, Jews possessed neither a national territory nor a unifying national language. Zionism could be considered a manifestation of European discourses channeled into the Holy Land—compare George Eliot’s *Daniel Deronda* (1876).

In *Reversing Language Shift* (henceforth RLS), Fishman (1991, p. 287) argues that RLS efforts often originate from Europe. In the case of Hebrew, he is even more right than he might have thought, not only sociologically—the mindset behind the motivation to revive the language was a reflection of a European nationalism—but also linguistically: the mindset of the emerging language itself is European. The revivalists’ attempts to (a) deny their (more recent) roots in search of biblical ancientness; (b) negate diasporism and disown the “weak, persecuted, feminine,” exilic Jew; and (c) avoid hybridity (as reflected in Slavonized, Romance/Semitic-influenced, Germanic Yiddish itself, which they despised) could not fully succeed. Ironically, although they have engaged in a campaign for linguistic purity, the emerging Israeli language often mirrors the very scorned syncretism and despised diasporism the revivalists sought to erase.

Lessons From the Promised Land to the Lucky Country

RLS (Fishman, 1991, 2001; Walsh, 2005; Hagège, 2009; Evans, 2010) is of great social benefit. Unfortunately, one of the main findings of the most recent *National Indigenous Languages Survey Report* (2005) was that the situation of Australia’s languages is grave (in both senses). Of an original number of at least 250 known Australian indigenous languages, only about 145 indigenous languages are still spoken, and the vast majority of these, about 110, are critically endangered: They are spoken only by small groups of people, mostly over 40 years old.

Eighteen languages are strong in the sense of being spoken by all age groups, but three or four of these are showing some disturbing signs of moving into endangerment. Many other languages are not fully spoken by anybody, but some of their words and phrases are commonly used, and there is community support in some parts of the country for reclamation and heritage learning programmes for such languages: either in reclamation proper (e.g., extensive courses similar to Israel’s *ulpanim*) or only in postvernacular maintenance (teaching Aboriginal people some words and concepts related to the dead language—cf. postvernacular Yiddish among secular Jews in the United States—see Shandler, 2005).

What lessons could be drawn from the famous Hebrew revival in the Promised Land for current attempts to resuscitate—as well as to maintain as postvernacular—no longer spoken Aboriginal languages in the Lucky—or is it unlucky—Country?

The fin-de-siècle Hebrew revivalists had several advantages compared with Australian revivalists, for example:

1. Documentation: Unlike Aboriginal languages, which are oral, Hebrew is the language of the Old Testament and the Mishnah.
2. Accessibility: Jews have been exposed to literary Hebrew throughout the generations, for example, when praying in the synagogue.
3. Prestige: Hebrew was considered a prestigious language (as opposed to Yiddish, for instance).

4 LIMITS OF LANGUAGE REVIVAL

4. Uniqueness: Jews from all over the globe only had Hebrew in common (Aramaic was not as prominent), whereas there are dozens of “sleeping” Aboriginal languages and it would be hard to choose only one unifying tongue, unless one resorts to Aboriginal English. The revival of a single language is much more manageable than that of numerous tongues in varying states of disrepair.
5. National self-determination: Revived Hebrew was aimed to be the language of an envisioned state.
6. Lack of ownership: Unlike in the case of Aboriginal languages (see Walsh, 2002), anybody has the right to speak Hebrew, without getting permission from the Jews.
7. Easy borrowing: Loanwords and foreign words are not considered theft. In fact, Eliezer Ben-Yehuda loved borrowing from Arabic, Aramaic and other Semitic languages.
8. Lack of place restriction: Hebrew could be and was revived all over the globe—consider Haim Leib Hazan’s coinage *mishkafaim* “glasses” in 1890 in Grodno (see Zuckermann, 2003, pp. 1–4).
9. Multilingualism: Jewish revivalists were used to multilingualism; Australia by and large is a “monolingual mindset” country.
10. Number: There are many more Jews than Australian Aboriginal people.

And yet, as we have seen, Hebrew revivalists, who wished to speak pure Hebrew, failed in their imprisoning purism prism, the result being a multifaceted and fascinating fin-de-siècle Israeli language, both multilayered and multi-sourced. Therefore it would seem likely that any attempt to revive an Aboriginal language will result in a hybrid, combining components from Australian English, Aboriginal English, the language(s) of the documenters (e.g., German missionaries), living Aboriginal languages, and—of course—the Aboriginal target language. That is of course not to say that we should not revive dormant languages and cultures. On the contrary! Revival activists should be encouraged to be more realistic—and less puristic—about their goals. For example, they should not be discouraged by English loanwords and pronunciation within the emergent language. Furthermore, establishing revival linguistics, a new subdiscipline of linguistics that complements documentary linguistics, crucial linguistic insights ought to be drawn from one revival attempt to another, for example with regard to which components of language are more revivable than others.

There are scholars, for example, Dalby (2003, p. 250), who scoff at some attempts at reviving the use of an endangered language: “This is no longer a language, any more than musicians are speaking Italian when they say *andante* and *fortissimo*. These are simply loanwords used in a special context.” A more balanced view is manifested in Crystal’s (2000, p. 162) comments on Kurna [ga:na], the reclaimed language spoken around Adelaide:

The revived language is not the same as the original language, of course; most obviously, it lacks the breadth of functions which it originally had, and large amounts of old vocabulary are missing. But, as it continues in present-day use, it will develop new functions and new vocabulary, just as any other living language would, and as long as people value it as a true marker of their identity, and are prepared to keep using it, there is no reason to think of it as anything other than a valid system of communication.

Influence from English (Aboriginal or Australian English) on Kurna is indeed far-reaching. Consider the following:

- At the level of phonology, there are often spelling pronunciations, especially for sequences of *er* (as in *yerlo* and *yerta* for instance), *ur* (as in *purle* or *purlaitye*). The *r* in

these words belongs with the consonant (it should be retroflex) but many times we hear an *er* vowel as in English *slur* or *sir*. The vowel should be /a/ in *yerlo* and *yerta*, and /u/ in *purle* and *purlaitye*. Stress is often placed wrongly on the second syllable instead of the first (Amery, 2000, pp. 121–2; Amery & Rigney, 2004, pp. 2–3);

- At the level of vocabulary, there are often calques—see Amery, 2000, p. 124, as well as chapter 12 *Wodlingga* “In the Home” (pp. 63–70), chapter 15 *Tidnaparndo* “Football” (pp. 81–4) and chapter 16 *Kuya Pirri-wirkindi* “Fishing” (pp. 85–8) in Amery (2007), where a range of calques have been developed—especially evident in the names of AFL football teams such as *Kuinyunda Meyunna* (lit. “sacred men”) for the St Kilda Saints. Knowingly—and jocularly—*cricket* (the sport) was replicated as *yertabiritti* (the term for the insect with the same name in English) (Amery, 2003, p. 86);
- Constituent order is free in Kurna as in other Aboriginal languages, though it tended to be subject–object–verb (SOV). Naturally, there are children and users of Kurna tending to produce more subject–verb–object (SVO) sentences, replicating English (Amery & Rigney, 2004, p. 5);
- English semantics tends to carry through to Kurna words (Amery & Rigney, 2004, pp. 5–7);
- The most pervasive influence from English is at the level of discourse. Almost everything said or written is translated from English. Thus, the turn of phrase and the idiom are from English (Amery, 2001a, pp. 190–4; Amery, 2001b; see also Amery & Rigney, 2006).

Some Aboriginal people distinguish between usership and ownership. Consequently, one could find indigenous Australians who do not find it necessary or important to revive their comatose tongue. However, Australia’s very own roadside dictum seems more pertinent here: Stop, revive, survive!

Thanks to Dr Michael Walsh, as well as to Shanghai International Studies University (SISU) and Australian Research Council (ARC). This entry is dedicated to the memory of Professor Michael Clyne.

Linear Unit Grammar

ANNA MAURANEN

Speaking takes place in time. Our immediate experience of it may be something like this:

wellthatthatthatreallydoes|that|does|get|get|at|the|idea|so|uncertainty|sometimes|seen|as|the
extremecaseofadiffuse|second|order|probability

This is one speaker's turn in an academic discussion (see Simpson, Briggs, Ovens, & Swales, 2002). While it may look odd at first glance, it probably comes as close to a hearer's experience as a transcript can. As soon as the string is divided up into orthographic words, it begins to look clearer:

well|that|that|that|really|does|that|does|get|get|at|the|idea|so|uncertainty|sometimes|seen|as|
|the|extreme|case|of|diffuse|second|order|probability

The greater familiarity of this format may or may not increase the faithfulness of the representation to a listener's experience. Even though written text is conventionally divided into words separated by spaces, there is no evidence that this corresponds to the way we normally process speech. On the contrary, it seems that a good deal of the time somewhat larger chunks than words are involved. Chunking is one of the two fundamental properties of language that *Linear Unit Grammar* (Sinclair & Mauranen, 2006) is based on. The other is linearity. Both are radical departures from the models of descriptive grammar that linguists are used to seeing.

Linear unit grammar (LUG) is essentially a theoretical model for conceptualizing grammar. At the same time, it reaches out to the practical world to help understand how language works. Above all, it bridges the gap between the way language is experienced and the way it is depicted in grammars. Rather than presenting yet another grammatical description of English, it takes us from the stream of language as it flows into our experience and shows how it connects to the complexities of grammars based on static, frozen language.

Linearity may be more obvious in speech than writing as speaking is temporal, but the spatial linearity of writing is equally important. Grammars, in contrast, are hierarchical. Thus, if language is seen as horizontal, descriptive grammars stand in a vertical relation to it. Grammars incorporate meaning in a paradigmatic way, as a set of mutually exclusive choices, where meaning supposedly derives from the relation of this choice to those that could have been made but were not. LUG presents meaning as the co-selection of constituents, which highlights syntagmatic over paradigmatic relations, and makes do with a minimum of hierarchy.

A clear exception to the tendency of presenting language structure in hierarchical manner is Brazil's *Grammar of Speech* (1995), a landmark in modeling language on a linear basis. More recent syntactic models, like *Dynamic Syntax* by Kempson, Meyer-Viol, and Gabbay (2001) and *Syntactic Carpentry* by O'Grady (2005, 2008), also develop grammatical descriptions that proceed from left to right, but they utilize far more hierarchy than LUG or Brazil's work.

LUG does not seek to replace but to complement traditional grammars, as a bridge between text and grammar. The final output of its analysis is a synthesis that can feed into

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

© 2013 Blackwell Publishing Ltd. Published 2013 by Blackwell Publishing Ltd.

DOI: 10.1002/9781405198431.wbeal0707

hierarchical grammars; they can furnish more detail in a number of ways, according to the model chosen. The first stages of LUG, in contrast, work on data that is normally inaccessible to other grammars, notably spontaneous speech; yet it is robust enough to embrace written text as well.

LUG works in stages, and the step-by-step manner of analysis is essential to it. In this it departs radically from most grammars, which perform analysis in a single pass. The first step, chunking, is intuitive; the others follow rigorous principles laid down in the model.

This entry outlines the main features of LUG by illustrating them in light of one example from a spoken transcript from the Cambridge and Nottingham Corpus of Discourse in English (CANCODE) corpus (http://www.cambridge.org/elt/corpus/corpora_cancode.htm).

Chunking

The point of departure is the notion of “chunk.” It is a pre-theoretical term, and defining it precisely is not even attempted. The chunking process can nevertheless be described and tested, for instance by asking speakers to do chunking (Sinclair & Mauranen, 2006) or by an analysis of tone units (Cheng, Greaves, & Warren, 2008). Both kinds of evidence have yielded high levels of agreement with LUG analysis.

Humans chunk incoming information as part of normal perceptual processes. In this, linguistic information is no different from any other. How large the chunks are and what exactly contributes to their boundaries are less clear. It looks as though boundary marking is complex, and different factors—grammatical, semantic, or cognitive—probably come together to bring about a sense of a “natural” chunk boundary that we seem intuitively to respond to. Plausible linguistic sources are phonological, tonal, and intonational patterning, pausing, syntactic boundaries from sentence to morpheme, phrases, breathing patterns, punctuation marks, and so forth. A likely cognitive source is the limited capacity of working memory, in Miller’s (1956) classic model about seven units, plus or minus two. This comes close to the five to seven words that seem the upper limit before a chunk boundary.

The first step in chunking is assigning boundaries—“provisional unit boundaries” (PUBs). It is important to focus attention on boundaries first, and only after they are in place to look inside them. Here is the excerpt illustrating the analysis, without indicating speaker changes at this stage:

I’ve not seen them for about a year now they’re both still at home living with their mum aren’t they I know bit weird family though aren’t they very very strange strange old world I know it’s like I see his mum and dad up the street and I’m sure they must recognise me I’ve been there often enough and they oh yeah never speak I know mm odd strange family. (excerpt from CANCODE)

Assigning PUBs consists in inserting boundaries where they seem “natural”; to capitalize on intuition, they should be put in quickly, spontaneously, without dwelling too long on deciding. At points of uncertainty, boundaries are better inserted than shelved.

It is vital to follow linear progression: Boundary assignment is to be done in view of the discourse up to that point, without looking ahead. The end of a chunk becomes evident at the latest when something comes up that is incompatible with its continuation, which is clear immediately as the new item begins. Linearity separates LUG from other analyses of speaking: while, for example, conversation analysis and interactional linguistics emphasize the temporal progression of speech events (see, e.g., Auer, 2005), they nevertheless perform analyses by looking at whole extracts at once.

The suggested PUBs for the extract are here. While some boundaries may be contested by some readers, usually surprisingly few are controversial.

Provisional Unit Boundaries (PUBs)

I've not seen them | for about a year | now | they're both still at home | living with their mum | aren't they | I know | bit weird family | though | aren't they | very | very strange | strange old world | I know | it's like | I see his mum and dad | up the street | and | I'm sure | they must recognise me | I've been there often enough | and | they | oh yeah | never speak | I know | mm | odd | strange family

Once the boundaries are in place, we can look inside them. The chunks serve as input to the next stages of the analysis.

Types of Chunks

From now on, a set of principles is applied in a cyclical process. Each cycle works on the output of the previous one, applying on it a simple set of distinctions, mostly a dichotomy. To begin with, two basic chunk types are distinguished: those concerned with what is being talked about (*they're both still at home; I see his mum and dad*), and those concerned with managing the discourse (*oh yeah; mm; and*). The distinction is rough and hard to pin down in exact terms, but recognizable.

Elements of the first type deal with what are often referred to as “topical matter,” “content,” or “message.” In LUG terms, they increment shared experience among interlocutors. They take forward the “contents” that individuals contribute to. We call these *message-oriented elements* (“M”). These elements are not always complete, and may sometimes look fragmentary, but they take the “topic” forward. They feature strongly in people’s spontaneous informal summaries of what was said.

The second main type is an element that focuses on social interaction and its management: *organization-oriented elements* (“O”). These help participants maintain cooperation and deal with real-time aspects of conversation: managing turn taking, changing topic, shifting footing, maneuvering situations. The fundamental distinction between the O and the M lies in their orientation toward *action* (O) or toward *message* (M). At this stage, the primary structure of text shows as linear alternation of units of discourse organization and units of topic incrementation (Table 1; speaker changes reinstalled).

Again, the assignment of M and O is strictly linear, done in light of the discourse up to that point. Since chunk boundaries are in place before the categories are imposed, it is easier to maintain linearity, and the analysis stays closer to the experience of online speech than a “synoptic” one, which draws on whole extracts at a time.

Types of O Elements

Further distinctions are made within the main element types at stage three. To start with O elements, they are of two kinds: those concerned with interaction (*okay; well; oh dear*) and those concerned with text (*for example, because, then*). The first attend to managing the shifting situations—framing and focusing moves, controlling timing, holding and yielding the floor, and so forth. Elements specializing in this work are “OI,” where “I” stands for “interactive.”

The other type is concerned with organizing the discourse as text. It brings the M elements into a network of relationships with each other. Their role could be expressed in Firth’s (1968) terms as “replacing sequence with order.” This order helps establish textual relations

Table 1 Types of chunks: M and O

1	A:	I've not seen them	M
2		for about a year	M
3		now	M
4	B:	they're both still at home	M
5		living with their mum	M
6		aren't they	O
7	A:	I know	O
8		bit weird family	M
9		though	O
10		aren't they	O
11	B:	very	M
12		very strange	M
13	A:	strange old world	M
14	B:	I know	O
15		it's like	O
16		I see his mum and dad	M
17		up the street	M
18		and	O
19		I'm sure	M
20		they must recognise me	M
21		I've been there often enough	M
22		and	O
23		they	M
24	A:	oh yeah	O
25	B:	never speak	M
26	A:	I know	O
27		mm	O
28		odd	M
29		strange family	M

such as exemplification or contrast, handle larger and smaller structures in text so as to set up anticipation, and position sequences in wider contexts. These are “textual”, or “OT.” In contrast to the OI, which look “outwards” from the unfolding text, relating it to the external world of interaction, the OT look “inwards” to the text, indicating and constructing complex interrelations between the M. From the point of view of the M, the O roles can be characterized as “first-level ordering” (OT) and “second-level ordering” (OI). They are shown in Table 2.

There are more OI than OT in this extract, which reflects the character of casual conversation. In some other genres, like written prose, we would expect the reverse, or even no OI at all. The distribution of element types is sensitive to text type.

As seen in the excerpt, O elements tend to be short, often just two or three words. The only OT are *and* (lines 18, 22) and *though* (line 9).

The OI most repeated here is *I know* (lines 7, 14, 26), followed by *aren't they* (lines 6, 10). All the OI help keep the discourse going, with *mm* and *oh yeah* doing little beyond showing listenership. All instances here are “convergent,” in contrast to “divergent” (examples would be *well*; *I don't know*; *but*), which shift direction by, for example, changing the topic or making a new opening (Mauranen, 2009).

The context-bound nature of the analysis shown in *I know* and *aren't they*, which in other contexts might count as M elements, or parts of them; similarly *it's like* could be an OT.

Table 2 Types of organizational elements: OT and OI

1	A:	I've not seen them	
2		for about a year	
3		now	
4	B:	they're both still at home	
5		living with their mum	
6		aren't they	OI
7	A:	I know	OI
8		bit weird family	
9		though	OT
10		aren't they	OI
11	B:	very	
12		very strange	
13	A:	strange old world	
14	B:	I know	OI
15		it's like	OI
16		I see his mum and dad	
17		up the street	
18		and	OT
19		I'm sure	
20		they must recognise me	
21		I've been there often enough	
22		and	OT
23		they	
24	A:	oh yeah	OI
25	B:	never speak	
26	A:	I know	OI
27		mm	OI
28		odd	
29		strange family	

Most of the time items are used conventionally, but speakers can exploit their potential flexibility, which a robust grammar must accommodate.

The organizing roles of OI and OT do not imply that they take the back seat in constructing discourse. Quite the contrary: O elements are vital in constructing the whole that constitutes linguistic activity, and, in essence, meaning. As Firth (1957) suggested, total language activity also incorporates other situational features, which implies that the role of OI in particular is pivotal as mediating between textual and extratextual contexts.

Types of M Elements

The fourth step of analysis involves M or "message-oriented" elements, which increment the evolving topic. They display more diversity than O, partly accounted for by the incompleteness of many M, especially in spontaneous conversation: Not all are successful and some are just fragments; many serve to rephrase speakers' first formulations, to modify, clarify, or expand them.

The basic element is simply called an M. It is a straightforward, mainly grammatical sequence, which does not need anything else to complete it (*I've been there often enough; I've not seen them*). An M often shows normal clause structure, but sometimes a single nominal group or an individual word is sufficient as a complete unit (*bit weird family; odd*).

Other M types are not equally complete or independent. Some follow an already complete M, and provide an addition or specification to it. These are “message supplements” (“MS”) and are characteristically specifying elements, such as adjuncts of time or place (*for about a year; up the street*). Another element that follows an independent M but does not make a new departure of its own is “MR,” “message revision,” which reworks an M by a slight reformulation like a small expansion or rephrasing. To keep track of the many M types, they are illustrated piecemeal by shorter passages at a time. The M, MS, and MR are marked out in Table 3:

Table 3 Types of increments of shared experience: M, MS, and MR

1	A:	I’ve not seen them	M
2		for about a year	MS
3		now	MS
4	B:	they’re both still at home	M
5		living with their mum	MS
6		aren’t they	
7	A:	I know	
8		bit weird family	M
9		though	
10		aren’t they	
11	B:	very	MR
12		very strange	MR
13	A:	strange old world	MR

As seen in Table 3, the “core” M are self-sufficient. Only one is not a full clause (line 8). MS add specifications of time (lines 2, 3) or other additional information (line 5). In turn, the MRs in this instance (lines 11–13) all rework the same evaluative M (line 8). The interposition of O elements (line 9, *though*, OT; line 10, *I know*, OI) does not interfere with the continuity of the incrementation of shared experience by M.

The passage continues with B’s turn (Table 4) and the first two M as above: an M followed by an MS (lines 16–17). In line 19 we have an element of a new kind: an “incomplete M” symbolized by “M-” (“M dash”). Like a core M, this is an M in its own right, yet it raises a strong expectation of another, completing element. An M- is thus not fully independent, but anticipates something else to follow. The anticipation is immediately fulfilled by *they must recognise me* (line 20), a “completion M” (“plus M,” “+M”), which supplies appropriate completion material to the M-. These two types normally appear in pairs, as again in lines 23 and 25, although in the fortuities of conversation it is quite possible that an anticipated completion of an M- fails to materialize. The conversation can simply drift to something else. O elements can come between M- and +M, so they need not be adjacent (line 24).

In all, M-type elements are interpreted as attempts, successful or not, to increment shared experience. What have been illustrated here cover most of the types, but not all. M elements tend to be analyzable by other, conventional grammars, and LUG need not break them down further.

Synthesis: Linear Units of Meaning

Following the four distinct steps of analysis, the final stage reverses the direction and makes a synthesis. The fifth step brings together the outcomes of the earlier steps. It bridges LUG and other grammars; it also narrows the gap between descriptions of spoken and written text, although unconventionally starting with speech.

Table 4 Types of increments of shared experience: M- & +M

14	B:	I know	
15		it's like	
16		I see his mum and dad	M
17		up the street	MS
18		and	
19		I'm sure	M-
20		they must recognise me	+M
21		I've been there often enough	M
22		and	
23		they	M-
24	A:	oh yeah	
25	B:	never speak	+M
26	A:	I know	
27		mm	
28		odd	M
29		strange family	MR

The synthesis results in linear units of meaning (LUM), *topic increments* that update the virtual world of shared experience. LUMs come fairly close to units generally recognized in grammars, such as clauses and phrases. They contain the rudiments of hierarchy in recognizing two kinds of relationship, one of which can constitute a component in the other. The *endocentric* relationship forms “textual objects,” single entities like noun phrases that must combine with something else to set up a communicative act. The *exocentric* relationship forms “textual incidents” by relating two separate entities such as subjects and predicates. Textual objects are thus typical components of textual incidents. It is the textual incident that updates and changes the virtual world of shared experience.

Step 5 again applies a staged approach: Altogether eight operations are applied one after the other as the synthesis takes shape. Here only a few are illustrated, together with the outcome.

At the outset, all OI are shelved, and kept for later as notes. The focus in this somewhat skeletal synthesis is on structural relevance, and OI lose theirs immediately. In our example the OI are affiliative interactive elements, which contribute to the fluent and consensual achievement of the conversation. In more conflict-driven conversations OI assume more divergent roles.

A number of operations are performed on M elements; M- and +M pairs are joined up (for instance, *I'm sure* with *they must recognise me*, lines 19, 20). MS are added to the nearest preceding M: *for about a year* and *now* (lines 2, 3) to *I've not seen them* (line 1), *living with their mum* (line 5) to *they're both still at home* (line 4), and so on. The third operation merges MR with those they repeat or reformulate: three reformulations of *bit weird family* (line 8) as *very* (line 11), *very strange* (line 12), and *strange old world* (line 13) are joined, and glossed as ‘very strange family’. Similarly in lines 28–9 *odd* gets reformulated as *strange family*. We can keep this last formulation, retain the OT, and put the other combinations in place. The example now reads:

I've not seen them for about a year now
 they're both still at home living with their mum
 —very strange family

though
 I see his mum and dad up the street
 and
 I'm sure they must recognise me
 —I've been there often enough
 and
 they never speak
 —strange family

Some added dashes for clarity are all that is needed to make this a readily readable passage that is analyzable by any conventional grammar. An intriguing outcome of the synthesis is the smoothly progressing, coherent text that was collaboratively produced by the interlocutors. This is not likely to be an intended consequence of a spontaneous conversation; we would, at most, expect such an outcome from a formal meeting, or perhaps a session of a task force. But it seems to be at work in ordinary, seemingly wandering, casual conversation. Moreover, speaker changes do not seem to play an essential role in the co-constructed text.

Critical Comments

LUG is a new departure in grammatical analyses, and has not been critiqued in a systematic fashion yet. The case could conceivably be made that if the initial chunking process had made use of sound tracks, or if all data had been transcribed on uniform principles, the outcome might have been different. In the same vein, it could be argued that embodied speech is even more informative than sound alone, since gaze, proximity, and gestures punctuate speaking in an important way, and therefore video material is a minimum requirement. I could go on; the more natural language is studied in its social environments, the more factors can be brought to play in linguistic description.

What is necessary or fruitful for solving a particular problem can only be established by empirical study—which requires its input from a model based on a sufficiently narrow focus for making novel observations. In practice, it is not possible to work on excessively rich material at once, and a vast amount of potential information needs to be abstracted away. The decision to present the material word by word is already a huge abstraction. Yet it enables comparisons across modes and genres, and is neutral enough not to predispose spontaneous intuitions about chunks to particular interpretations.

LUG was developed to highlight the consequences of linearity for grammatical analysis, and the diversity of the data it drew on was a deliberate choice over a more naturalistic set of a single type of material.

Conclusion

LUG bridges the gap between linear text and hierarchical grammar, that is, ongoing discourse and conventional grammatical analysis based on Standard English. Its “bootstrapping” approach to analyzing text enables a broad range of text types to be brought under the same analytical gaze. This opens a new perspective for integrating speech and writing, showing a rigorous analysis of spoken discourse whose outcome is strikingly close to ordinary written prose.

LUG makes a contribution to the analysis of spoken interaction with its strict focus on a linear, temporal perspective on unfolding talk. Although a structural emphasis tends to downplay interactive aspects of communication, LUG recognizes the crucial impact of

interaction and the situational context to grammatical description and to the complexity ensuing from the simultaneously collaborative and competitive nature of interaction. OI, which specialize in managing interaction, are vital in integrating grammar and discourse. Their outward orientation and focus on the situation connect them immediately to interaction.

Bridging the gap between language as experienced in conversation or on the page and the expositions seen in grammatical analyses has much pedagogical potential. Awareness of the mother tongue and the learning of other languages can both benefit from such a bridge, making grammar more accessible to the student. Translator and interpreter education similarly stand to gain from the LUG approach: A linear, chunk-based analysis of speech can be useful in understanding interpreting. Although in essence a theoretical model, LUG can easily fit into a variety of applications.

Lingua Franca and Language of Wider Communication

MARGIE BERNS

The potential uses of any particular language are manifold. These uses have been variously described in such terms as creative, administrative, instrumental, or interpersonal; as political or ideological; as rhetorical or symbolic. Among other labels for the functions a language can serve are “lingua franca” and “language of wider communication.” Although they are two distinct terms, they are often used synonymously. Lingua franca, coined in the High Middle Ages and the older of the two terms, has been defined as “any language used for communication between groups who have no other language in common” (Matthews, 1997, p. 209) and as “a language used habitually by people whose mother tongues are different in order to facilitate communication between them” (Meierkord, 2006, p. 163). Language of wider communication, of more recent coinage, has been glossed as a “language that affords a means of communication beyond the local group to the national and international arenas” (Barotchi, 1994, p. 2211) and as “a language that provides a mutually intelligible medium for speakers in multilingual societies” (Brutt-Griffler, 2006, p. 690). The current synonymous nature of the terms is explained rather neutrally as language of wider communication having become a contemporary replacement term for lingua franca (Clayton, 1998, p. 155). A somewhat sharper comment is that in modern English the term “has become a hackneyed, irrelevantly colorful word to mean a language of wider communication, used to bridge language barriers” (Ostler, 2010, p. 4; see also Ostler, 2010, on different types or degrees of lingua franca). Adding to the terminological mix is the relationship of lingua franca to other concepts called upon to explain or identify the role of a language in the international context or in global interaction. These include “international language,” “global language,” and “world language,” all of which McArthur (2001, p. 1) has attempted to distinguish from one another in a discussion of “the current condition of the English language worldwide.”

Rather than attempt the slippery task of disentangling the meanings, referents, and preferences for either of the two terms of focus here, namely, lingua franca and language of wider communication, or other related concepts, the following will be restricted to a discussion of lingua franca. This choice is supported by its wider currency among applied linguists due perhaps in part to its prominence in ongoing discussions and studies of the global spread of English and the role of this language and its varieties in national, regional, and international contexts.

The modern term lingua franca has its basis in the means of communication that developed between Europeans from various language backgrounds and Arabic speakers engaging in commercial and military activity in parts of the eastern Mediterranean basin. Accounts of its substance vary, but it seems generally agreed upon that it was a mixture of lexical items from Arabic, French, Greek, Italian, Spanish, and Turkish. Italian (in the Levant) and Spanish (in Northwest Africa) have been identified respectively as the initial and later base languages. Of particular relevance in understanding current interest in and adoption of the term is its etymology, which scholars do not agree upon. One commonly held view is that the term was originally used to name the Romance-based pidgin that developed in the Middle Ages and the Renaissance (from around 500 to 1600). It was

apparently a retranslation of some eastern Mediterranean term (into which language is not certain—Latin and Italian are frequent candidates; Ostler, 2010); Schuchardt (1909, cited in Kahane & Kahane, 1976) and other etymologists have suggested that the term itself has a Byzantine base with an Arabic model. The Byzantine Greeks knew it as *phrángika*; the Arabs of the Levant called it *lisān al-faraṅṅ*. In either case, it was translated as “language of the Franks,” by which were meant the Europeans in general, but the French and Venetians in particular because of their primacy in maritime commerce (see Kahane and Kahane, 1976, for a detailed analysis of the history of the term). A Western view of the etymology of *lingua franca* is represented by Trudgill (2001), who claims that *lingua franca* actually meant “French language,” and that it was a form of Provençal used by the French in the period of the crusades. Competing views also determine how the plural is formed. The two more commonly used forms are the Latinate, which dictates “*linguae francae*,” while the English language variant is “*lingua francas*.” A third, and rare, formulation is the Italian “*lingue franche*.”

Whereas *lingua franca* originated as a contact vernacular with a set of formal features defining a particular pidgin in the Mediterranean, its meaning has become generalized. Today the term is more generically defined as any language used for communication between two or more groups of people who have no other language in common and have not grown up with the language. That is, *lingua franca* identifies the use or function a language fulfills rather than formal features represented by a specific grammar or linguistic description. *Lingua franca* as a separate, distinct language is no more.

Languages have been spread and become *lingua francas* by various means. Three quite common contexts over the centuries have been empire building, as was the case with Arabic (which also served in the 13th century as a language diplomacy and science), English, French, Hindi, Persian, Russian, and Urdu; trade, as with English, Greek, Persian, Portuguese (in coastal Africa, parts of India), Sabir, or Swahili; and religious missions, the case for English and Spanish, which kept their secular status unlike Latin and Pali, which were sacred languages for Roman Catholicism and Buddhism, respectively.

Numerous other languages have served as common means of communication for these purposes as well. And not all of these languages have continued as *lingua francas*; their fortunes would have depended upon a variety of factors including their continued usefulness, adoption as a second or as an official language in a community, or the withdrawal of occupying powers. Latin is an example of a *lingua franca* par excellence, having functioned in empire building during the Roman Empire, in the religious missions of the Roman Catholic Church, and as a European language of science and diplomacy. At its peak (AD 96–180), the Roman Empire’s territory in Europe and around the Mediterranean covered approximately four million square miles. As the official language in Rome, Latin was by default used to govern widely distributed and linguistically rich populations. At first restricted to the administrative function, it was eventually learned and used by all levels of society for instrumental and interpersonal purposes. Regional and local variation resulting from language contact and linguistic nativization led to the development of dialects that eventually became recognized as the languages known today as Catalan, French, Italian, Occitan, Portuguese, Rhaeto-Romanic, Romanian, and Spanish. The end of the Western Roman Empire in AD 476 initiated Latin’s decline as a *lingua franca* of empire, but its adoption by the Catholic Church in the second century made it the *lingua franca* of religious control and communication into the 14th century. Latin survived to various degrees in secular use as a language of law, education, and diplomacy into the 18th and 19th centuries. Still used for official purposes by the Roman Catholic Church, its liturgical role in the present century has diminished.

There has long been concern that global communication and cooperation are hampered by the world’s multilingualism. The thinking is that a universal language, that is, an

international lingua franca, would foster exchange of ideas and quite possibly end international conflicts and have the potential to bring about world peace. One response to this desideratum has been the construction of artificial languages. Esperanto is the best known of these and enjoys the greatest success and visibility. First formulated in the 19th century by a linguist, L. L. Zamenhof, this European-type language is believed to be a good choice as a common working language for the European Union because it is not associated with any one country or culture and thus it disadvantages no one. However, its European features make it less viable at the United Nations, where languages other than Indo-European languages are used (Ryan, 2009). Interlingua, a mid-20th-century creation, is a product of the International Auxiliary Language Association. Derived from English and Romance languages in both grammar and vocabulary, it therefore suffers the same limitations as Esperanto. A different approach to meeting the need for a language of international communication was C. K. Ogden's (1930) Basic English. Rather than attempt to construct a new language, Ogden designed a simplified form of English to function as an international auxiliary language and to help in the teaching of English as a second language. Consonant with a desire for world peace after World War II, Basic English gained attention as a linguistic instrument toward this end, but has yet to fulfill its promised potential in this role.

A variety of present-day languages are widely used as regional, intranational, and international lingua francas. Of particular interest are the five languages whose lingua franca users outnumber the mother tongue users. These, and their percentages of lingua franca users, in descending, order are: Swahili (98%), Malay (73%), English (71%), Persian (67%), and Urdu (60%) (Ostler, 2010). From this set, only English has become a language of wider communication on a global scale, but not in the simplified and controlled form that Ogden envisioned. Rather, British English and American English have been spread through the mechanisms of colonialism and globalism to become the means of communication in trade, commerce and diplomacy, most notably after World War II. No longer restricted to these domains alone, English is now identified with such fields as science, technology, international travel and tourism, international law, and entertainment. Thus an increasing number of academic and scientific journals publish exclusively in English, the primary language for presentations at international professional conferences is English, universities attracting multilingual students offer courses with English as a medium of instruction, and even contestants in international singing competitions perform in English or a mixture of English and other languages. In addition, English is widely used as a working language of international organizations and commissions, for example, by the United Nations and—the hopes of the Esperantists notwithstanding—by the European Union.

English is, of course, more than the first or primary language of Americans, the British, and other Inner Circle users of an international lingua franca. Although commonly compared with Latin as a lingua franca, English is quite different in large part due to its worldwide reach and its initial status as the colonizers' language in the Outer Circle and the language of "foreigners" for Expanding Circles users, that is, as a language of colonization and of globalization. This distinction is evident in the multiple functions English has come to serve, functions that are differentiated across contexts of use. To relegate English to the role of lingua franca in such contexts as India or Turkmenistan, for example, it is argued, is to ignore their unique histories with English and the sociolinguistic realities of English with which they live (see Kachru, 1996). In India, for example, English, a language with a colonial legacy used throughout the country primarily by the educated elite, was chosen as a national language alongside the indigenous Hindi which had already long served as a lingua franca in Northern India. Today, English is used for administrative, instrumental, and interpersonal functions and is learned as a second language by nonelites

as well as by elites. Literature written in English by Indians has become widely celebrated, which has led to recognition of educated Indian English as a standardized variety in its own right (for more on Indian English, see Kachru, 1983). In contrast, English in Turkmenistan, for example, plays a minor role throughout the country due to government resistance to the language and to the involvement of Western agencies in English language education. Thus, rather than encourage learning and use of English, language policy in this part of Central Asia discourages its learning and use for fear of Westernizing influences on the culture (Sartor, 2010). These two illustrations suggest that English as an international lingua franca is an abstraction that is difficult to concretize because of the realities of its uses, use, and learning across widely diverse cultural, social, and linguistic environments. Given this, the notion of English as a lingua franca can be seen as having lost contemporary significance.

While Ogden may have envisioned an English that could transcend communal and cultural boundaries through simplification and control, the dream of a stable, international form (or variety) of English is unlikely to ever be realized as long as multiple local identities are expressed through the one medium of English (Pakir, 2009). A different point of view on the potential for a stable variety of English known to nonnative speaker elites and serving the function of lingua franca is represented by the English as Lingua Franca Movement (e.g., Seidlhofer, 2001; Jenkins 2006). This movement seeks to identify core features of English as it is used in interactions by nonnative speakers, with an eye not only on description but also on teaching these features to learners of what they label “English as Lingua Franca” (ELF) or sometimes “Lingua Franca English” (LFE). These labels in effect represent a revival of the restricted Medieval and Renaissance use of *lisān al-faranġ* and signal a considerable departure from recognition of the world’s Englishes as markers of identity and dynamic systems of language use, and consequently from the adequacy of lingua franca to capture what English has and is becoming. It is such dynamism and sociolinguistic value, it is claimed (Smith & Nelson, 2006), that demands of those who use different varieties of English in international contexts to negotiate their own common forms and norms of use (grammatical, semantic, and pragmatic). In other words, constant renewal and creation of meanings and forms among users from the world’s numerous and diverse language and cultural backgrounds militate against development of a stable variety comparable to the circumstances of the “language of the Franks.”

A range of circumstances—for example, new trade markets, expansion of political and military power, spread of religion, or some combination of these—can bring languages into prominence and generate interest in and need for learning the language and subsequently its use by a significant number of people. But circumstances are known to change. New rulers with new languages come along, ties between once strong trading partners break, and secularism threatens religious bonds. Latin, which enjoyed a run of two millennia before it was relegated to the status of “dead” language, was replaced by the vernacular languages that spun off from it and by the other languages of Europe that benefited from the development of Gutenberg’s printing press and any number of changed circumstances, including the growth of Christianity and of Islam, financial mismanagement, imperial incompetence, and military unrest. But a lingua franca need not die out. Russian, which has had its role as lingua franca reduced in the former Soviet satellites, is in no danger of dying out. Its future for the moment is being secured in its replacement of older, smaller indigenous languages across Russia. German, once the language of the international scientific community, began to lose its status in the 1930s. The rise of National Socialism and its policies and programs were at the root of its decline. When the balance of political power shifted to the United States after 1945, German’s circumstances changed dramatically. English eventually was given the role of lingua franca for the dissemination of developments in science and technology, but German continues as a key language in the European Union.

To date, English has been a lingua franca for 200 years, give or take a few. Now it is no longer restricted to the domains of trade, research, and colonial control, the number of its users is growing, and as already shown, lingua franca users outnumber mother tongue users. Instruction in English is being offered to children at ever younger ages, thus increasing the potential for an even larger percentage of nonnative speakers. The history of its spread and its uptake by users are well documented (see Bolton & Kachru, 2006), its present circumstances are likewise being more comprehensively recorded, and the future of English as a medium of communication among those who do not share a common language is the subject of speculation. Chinese has been named as a possible replacement given China's rapid development as a major player in the world's economic arena and the sheer size of its population, many of whom represent ethnic and linguistic minorities who learn Putonghua to participate in life at the national level (Xu, 2009). It has even been suggested that the future will not see another language serving as the single dominant medium of communication around the world, but that English will be the last global lingua franca. The need for a language to bridge linguistic gaps will be met by technological developments that will do whatever translation and interpretation is required to get things done (Ostler, 2010). A prediction of another sort sees English maintaining a key function; it will become such an essential tool that schoolchildren will be required to learn it along with basic computer literacy and mathematics (Graddol, 2006). And if the fate of a lingua franca is linked with the fate of those who introduced it on the scene, by whatever means, then it also has to be kept in mind that the future of English, too, is connected to the status of the United States as a dominant world power. However, as English has taken on new identities, new forms, and new uses in contexts outside of the US and Britain (regardless of the futures of these nations) its past as a lingua franca has left a legacy of Englishes around the world.

Linguaculture

KAREN RISAGER

Linguaculture (or languaculture) is a term that focuses on culture in language or the cultural dimensions of language. The term was introduced by the American linguistic anthropologist Paul Friedrich in a 1989 article on the relationship between political economy, ideology, and language (Friedrich, 1989). (He also uses the term in a manuscript from 1988.) In the article he writes that “the many sounds and meanings of what we conventionally call ‘language’ and ‘culture’ constitute a single universe of its own kind” (1989, p. 306), and he describes the concept of linguaculture with these words:

a domain of experience that fuses and intermingles the vocabulary, many semantic aspects of grammar, and the verbal aspects of culture; both grammar and culture have underlying structure while they are constantly being used and constructed by actual people on the ground. I will refer to this unitary but, at other levels, internally differentiated domain or whole as *linguaculture*, or, concretely, Greek linguaculture, rural southern Vermont linguaculture, and so on. (1989, pp. 306–7; italics in the original)

Thus the concept of linguaculture does not encompass all of culture, but only “the verbal aspects of culture.” Friedrich adds that this terminological innovation can “help to get rid of the decades-long balancing act between ‘language *and* culture’ (‘how much of each?’), ‘language *in* culture’ (‘culture *in* language?’)” (1989, p. 307, italics in the original).

The American linguistic anthropologist Michael Agar borrows the concept from Friedrich, but changes it to “languaculture.” He justifies his alteration of the term as follows: “I modified it to ‘langua’ to bring it in line with the more commonly used ‘language’” (Agar, 1994, p. 265). In his book *Language Shock: Understanding the Culture of Conversation* (1994), Agar presents the linguistic and anthropological basis for ideas about the interrelation between language and culture, especially in connection with the discussion of linguistic relativity, that is the discussion of the extent to which language determines, or influences, thought (also called the Sapir–Whorf hypothesis). He deals with the misunderstandings and cultural awareness that can arise in connection with conversations, both when “the same language” and when “different languages” are concerned.

Agar introduces the concept of languaculture in order to be able to sum up culture and language in one word:

Language, in all its varieties, in all the ways it appears in everyday life, builds a world of meanings. When you run into different meanings, when you become aware of your own and work to build a bridge to the others, “culture” is what you’re up to. Language fills the spaces between us with sound; culture forges the human connection through them. Culture is in language, and language is loaded with culture. (Agar, 1994, p. 28)

The term “languaculture,” then, stresses two relations: “The *langua* in languaculture is about discourse, not just about words and sentences. And the *culture* in languaculture is about meanings that include, but go well beyond, what the dictionary and the grammar offer” (Agar, 1994, p. 96; italics in the original). Agar proposes that what Whorf was really talking about was languaculture.

2 LINGUACULTURE

Agar also introduces the concept of “rich points,” meaning the places in conversation where people misunderstand one another. It is there that there is the opportunity to glimpse “culture,” to become conscious of cultural differences. He writes about “the Whorfian Alps” in linguistic communication in the sense that between people who have different languacultures (which ultimately everyone has) a number of cultural differences arise; the issue is to bring these out into the open and try to go beyond them.

Agar develops the concept in several publications, including a 2008 article. In this article he argues that one should think of ethnography as second languaculture learning and translation. He suggests that the usual abbreviation L2 be replaced by LC2 (second languaculture), and similarly that translation should be seen as a relation between LC1 and LC2. He argues that ethnographic work is both a process where the ethnographer learns a second languaculture, including experiences with significant rich points, and a product where the ethnographer struggles with communicating his or her interpretation of LC2 in a translation to an LC1 public.

Whereas Agar focuses on ethnographic studies of languaculture in local settings, the Danish sociolinguist and cultural educationalist Karen Risager introduces a transnational perspective (Risager, 2003, 2006, 2007). (Risager has used the term “languaculture,” but in her recent writings she prefers “linguaculture” as a perhaps more straightforward term for linguists.) The transnational perspective refers to and extends the theory of the Swedish social anthropologist Ulf Hannerz on transnational cultural flow and cultural complexity (Hannerz, 1992). In Hannerz’s theory the world is characterized by diverse cultural flows, that is flows of meaningful forms like images, music, food, clothing, architecture, and so forth, and Risager (2003, 2006) argues that these flows include linguistic flows: flows of English, Danish, Chinese, and so on, including varieties and mixtures of these. Language is thus seen primarily as language practices flowing (spreading) in social networks across national structures and communities in the world. The linguistic flows are embodied in people moving, and when people move or migrate, they carry their (personal) languacultures with them to new places. In this view, the concept of languaculture is used as a term that on the one hand emphasizes that language always has cultural dimensions, and on the other hand shows that a language and its languaculture can be dissociated from one cultural context and integrated into a new one:

Language [and its languaculture] and culture [i.e., the rest of culture] are thus both inseparable and separable at one and the same time. Language has considerable elasticity as a tool in all types of context and in connection with all kinds of content. So I have sometimes called language a Velcro fastener: language can easily change context and thematic content, but once it has been introduced into a new place and/or used for a new content, it quickly integrates and “latches on.” (Risager, 2006, p. 196)

Risager widens the scope of the languaculture concept by analyzing it in three interconnected dimensions (concerning both oral and written language; 2003, 2006): the semantic-pragmatic dimension, the poetic dimension, and the identity dimension—all representing well-established, but separate, academic fields. The semantic-pragmatic dimension is the one that is primarily associated with the languaculture or linguaculture concept, and it links to linguistic anthropology, including the Whorfian and the German Humboldtian traditions, as well as to cross-cultural semantics and intercultural pragmatics. The poetic dimension has to do with the aesthetic uses of language in play, ritual, and art, and it links to studies of literature. The identity dimension of language has to do with the social and cultural significance of the choice of language or variety of language, and it links to sociolinguistics, especially to studies of social meaning and relations between language and identity.

Risager (2007) discusses the use of the languaculture concept as integrated in a transnational paradigm of language teaching, and Mackerras (2007) includes the languaculture concept in a discussion of how a sociocultural approach can help students become intercultural learners who can weave together everyday and scholarly concepts.

The word “languaculture” (or “languaculture”) is a lexicalization of the idea that there is culture in language or that language practice is cultural practice in itself. It also has an adjectival form: “linguacultural” (or “languacultural”). Sometimes another expression is used, namely “culture-in-language,” for example by Crozet and Liddicoat (2000), who deal with the teaching of culture as an integrated part of language. The expression “culture in language” may be used in opposition to “language in culture,” which focuses on the role of language in the wider culture. A third kind of expression is “language and culture” (also with an adjectival form: “language-and-cultural”). This term emphasizes the general inseparability of language and culture, irrespective of the specific part-whole relationship. This term has for example been used by the British cultural educationalist Byram (Byram & Morgan, 1994). In the French context, the expression “langue-culture” is often used, for instance by Galisson (1991), who focuses on cross-cultural lexical semantics with reference to French. In the German context, the most usual (near-)equivalent for languaculture would be “Kultur in der Sprache” (Risager, 2000), as “Sprachkultur” traditionally means cultivation of the language.

Many other linguists are working with languaculture without using any of these expressions. Among these the following can be mentioned: Wierzbicka (1997) on cross-cultural semantics; Blum-Kulka, House, and Kasper (1989) on cross-cultural pragmatics; Dovring (1997) on the political consequences of semantic diversity in the English language; Ochs (1988) on language socialization in culture; Lantolf (1999) on second culture acquisition; Kramsch (1993) on the teaching of language and culture as discourse; and Müller-Jacquier (2000) on intercultural teaching.

Linguistic Analysis of Disputed Meanings: Threats

TAMMY GALES

Threats are intentional speech acts that use “language to send a message” and “bring about a desired transfer of information” (Fraser, 1998, p. 160). Like many other speech acts, such as warnings and promises, a threat’s pragmatic meaning is dependent on the illocutionary force—the intent—with which it is uttered. For example, a threatener might intend to provide humor, as when a guest threatens to consume all a host’s food due to its superior quality; vent anger, as when a customer threatens to sue a store for knowingly selling faulty merchandise; or instill fear, as when the Army of God threatened to bomb an abortion clinic if “the murder of children” did not stop (Academy Group, 2009). As in the authentic final case, when the intent is interpreted to be dangerous and law enforcement becomes involved, the threat undergoes a threat assessment, a process in which investigators examine a variety of context-dependent social, psychological, and linguistic factors associated with the threat to attempt to determine first, whether the threat is real; second, how dangerous the threat is; and third, how likely it is that the threat will be carried out. This entry describes the threat assessment process, discusses current methods of linguistic analysis performed on threats for the purpose of assessing authorial intent and viability, and reviews recent research on linguistic assessments of intent in threats.

When a potentially volatile threat is anonymous, additional related analyses, which are not covered here, may accompany a threat assessment. These include linguistic profiling—the analysis of a text’s sociolinguistic markers to help reveal the author’s possible region of origin, gender, native language, or educational level; authorship analysis—the analysis of linguistic and stylistic features in a document of questioned authorship in comparison to those in a separate set of documents of known authorship to investigate whether they are consistent with common authorship; and voice comparison—the analysis of the acoustic qualities in a speech sample from an unknown speaker as compared to those from a known speaker to determine whether they are consistent with having been spoken by the same person.

Threat Assessment

When a spoken or written threat is inferred to be dangerous by a hearer or recipient and is reported to a law enforcement agency or threat assessment firm, investigators follow a generic protocol, which includes investigating whether the communication is indeed a threat, how dangerous it may be, and how plausible it is. To answer the first question, analysts examine the threat to determine what negative outcomes, if any, the threat portends, as a threat in need of further investigation is one that is made to the detriment of the hearer and that tilts the scales of power in favor of the speaker (Shuy, 1993; Fraser, 1998).

Second, analysts categorize the threat as either direct, conditional, or indirect, as each designation is said to possess various levels of assessed danger. A direct threat (e.g., Text 1) is thought to be the most imminently serious since the language clearly identifies a target, time, mode (e.g., defamation, murder), and method that will be used to carry out the threat

2 LINGUISTIC ANALYSIS OF DISPUTED MEANINGS: THREATS

(e.g., by planting a bomb or divulging company secrets) (Napier & Mardigian, 2003). In October, 2008, 65 copies of Text 1 were sent with a white powdery substance to Chase Bank and several US government agencies (Federal Bureau of Investigation [FBI], 2008). (NB: All nonpublic identifying information in texts 1–3 has been changed, but all non-standard language use remains intact.)

Text 1

STEAL TENS OF THOUSANDS OF PEOPLE'S MONEY AND NOT EXPECT
REPRERCUSSIONS. IT'S PAYBACK TIME. WHAT YOU JUST BREATHED IN WILL
KILL YOU WITHIN 10 DAYS. THANK JOHN SMITH AND THE FDIC FOR YOUR
DEMISE.

A conditional threat (Text 2) is usually “presented as an either/or proposition” that is contingent upon the recipient carrying out a requested action (Napier & Mardigian, 2003, p. 17). Depending on the threat’s plausibility, depth of planning, and level of detail, conditional threats are assessed to be more or less serious. This threat, which challenged a proposed change to interstate trucking regulations, was sent to the White House in October, 2003 (FBI, 2004).

Text 2

If you change the hours of service on
January 4,2004 I will turn D.C. into a ghost town
The powder on the letter is RICIN
have a nice day
Fallen Angel

An indirect threat (Text 3) is the most difficult type to assess as the language is frequently vague and the threatened action is not dependent on the fulfillment of another action. Indirect threats often take the tone of a warning or complaint with the threatened meaning left for the recipient to interpret (Napier & Mardigian, 2003). Text 3 was posted on a software company’s internal blog site in 2008 (Academy Group, 2009).

Text 3

#27—Update Abacus slashes pay in North Templeton, Springfield
It looks like it's time to start sprinkling iron filings and carbon dust around the power supplies. A few well placed magnets also add to the fun. Acme should brace itself for a rough ride! . . .

Finally, the third step is to determine the plausibility of the author acting on the threat. Within law enforcement frameworks, there are three designations for threats—high, moderate, and low—which are assigned based on an assessment of seven equally weighted social, psychological, and linguistic factors: degree of anger expressed, level of personalization, level of specificity, evidence of technical knowledge, evidence of commitment, existence of ancillary incidents, and level of escalation if multiple texts or events exist (Rugala & Fitzgerald, 2003). In general, analysts consider low-level threats as those that appear to pose little risk. This can be signified by lexically mitigated or conditional language (e.g., “perhaps I might . . .”), implausible actions (e.g., “I will blow up every building at the same time . . .”), a lack of detail as to the time, place, or person targeted (e.g., “You better watch out or else . . .”), or any combination thereof (Napier & Mardigian, 2003). Moderate-level threats are those that are more believable, but still suggest some doubt in terms of the person or place targeted or the plausibility of fulfillment; these usually demonstrate a certain level of forethought in their description of how the threat will be carried out and

provide more descriptive language about the target of the threat (Napier & Mardigian, 2003). Finally, high-level threats are those that are highly credible and whose stated facts can be readily verified. These typically contain detailed descriptions of how the threat will be carried out, who or what is targeted, how the threatener will reach that target, and the time frame in which the threat will occur (Napier & Mardigian, 2003). According to the FBI's National Center for the Analysis of Violent Crime (NCAVC), "the more direct and detailed a threat is, the more serious the risk of it being carried out" (Rugala & Fitzgerald, 2003, p. 780).

Linguistic Analysis of Threatening Meaning in Practice

In current practice, the *focus* on linguistic (as opposed to social or psychological) features as a basis for analyzing a threat's inferred meaning is a relatively new phenomenon, and while the processes of voice comparison, authorship analysis, and linguistic profiling have received more attention over the past few decades, little has been formally written about the actual practice of linguistically analyzing intent in threats. What has been documented comes via law enforcement, and lists two primary methods of analysis: textual analysis and corpus analysis.

First, textual analysis "is the examination of behavioral and linguistic indicators in a communication to learn more about its purpose and its author," which includes a "detailed examination of the elemental parts of a verbal or written threat in order to assess the genuineness and overall viability of the expression of an intent to do harm" (Fitzgerald, 2009, p. 2). And while the labels attached to this process (i.e., "textual," "stylistic," and "discourse" analysis) have been used somewhat interchangeably within law enforcement settings (McMenamin, 2002), in general, threat assessors color-code a text to highlight different categories of potentially valuable information. For example, green identifies orthographical or grammatical information that is commonly misused (e.g., *they're/their/there*), but has been used correctly—according to a standard variety—by the author, while blue identifies unusual words or phrases that may shed light on the author's hobbies, interests, or community of practice (Fitzgerald, 2009). Additionally, words or phrases that potentially indicate levels of intent, such as "may" and "perhaps" on the low side versus "he will die" and "I will shoot him" on the high side, are documented (Napier & Mardigian, 2003, p. 18). After coding, the identified linguistic patterns are used to support assessments of intent or viability by revealing information about an author's apparent level of knowledge or intelligence (e.g., are words specific to the field of chemistry used that demonstrate enough expertise to make a bomb?), personal—and potentially dangerous—affiliations (e.g., is language used that is affiliated with known terrorist organizations?), or emotional stance (e.g., is anger linguistically exhibited that provides motivation for fulfilling the threatened act?) (Rugala & Fitzgerald, 2003).

Second, law enforcement descriptions of corpus linguistic assessments of intent or levels of commitment are still rather limited in nature. As of 2009, there were two general threat corpora in the USA: the FBI's Communicated Threat Assessment Database (CTAD), containing 3,721 threatening communications with a total of 888,286 words, and the Academy Group's Communicated Threat Assessment Reference Corpus (CTARC), containing 470 threats and 152,078 words (Gales, 2010). The immediate benefits of these corpora as investigatory tools can be seen in the areas of authorship analysis and linguistic profiling (e.g., nonstandard syntactic patterns, lexical choice, or stylistic features from an unknown threat can be compared to thousands of other threats in an attempt to link cases or narrow the suspect pool), while further empirical benefits may be seen as organizations document variables that contribute to successful assessments. However, even though it is stated that an "investigator can complete the assessment and analysis of the level of threat presented

by the document” through a combination of his or her law enforcement experience, an analysis of the communication’s metadata (e.g., the date it was received, its mode of submission), and a search to determine whether “there were any similarities between the linguistic features in the current communication and others in the corpus” (Fitzgerald, 2009, pp. 7–8), it is currently unclear how investigators use corpus analyses of linguistic features to arrive at a determination of a threat’s possible level of intent or viability.

Linguistic Analysis of Threatening Meaning in Research

Research on linguistic features associated with interpreting meaning in threats has primarily arisen from studies in psychology and sociology focusing on the social role of threats (Milburn & Watman, 1981), personality traits (e.g., Smith, 2006), and workplace violence (e.g., Davis, 1997; Turner & Gelles, 2003). When assessing the likelihood that a threat will be carried out, these studies have reported various linguistic findings. For example, the inclusion of insulting, pejorative language “can be expected to raise the intensity of feeling” and possibly lead, on the part of a normally calm person, to a threat being enacted (Milburn & Watman, 1981, p. 56); “almost all of those persons who do commit acts of violence use profanity and other offensive language—before, during, and after the act—to describe or discuss both the victim and the violence itself” (Davis, 1997, p. xiii); language that mentions suicide, weapons, or the object of desire and includes profanity, themes of hopelessness, violent behaviors, or fantasies can serve as an indication of potential violence (Turner & Gelles, 2003); and the personality trait of decisiveness, as measured by the occurrence of hedging phrases such as “I think” or “kind of,” can lead to an assessment of how prepared a threatener is to carry out an act (Smith, 2006). In addition to these claims that more or less mirror the linguistic features used by law enforcement investigators, Turner and Gelles (2003) reported that the more detail included in a threat, the higher its level of dangerousness; conversely, the more general or vague the language is, the lower the level of potential danger.

However, while this work has provided a valuable first step toward interdisciplinary research on assessing intent in threatening language, several critiques can be made regarding the *linguistic* nature of this work. First, the examination of linguistic features has most often been ancillary to that of features of a behavioral nature. For example, Davis’s (1997) work on risk management focuses primarily on assessing threatening behaviors, of which the use of profanity is a part. No further mention of lexical or grammatical features was made, so it is unclear how much and what kind of linguistic analysis was actually performed. Second, the methods used to assess these claims are frequently vague or seemingly impressionistic in the way they are reported. In Turner and Gelles’s work, for instance, they claim that their risk management approach has been “tested hundreds of times in workplaces throughout the nation and beyond” (2003, p. xix); while this may be true, the empirical support needed to validate and replicate their findings is absent.

Recently, a corpus-based study testing linguistic features that have been associated with threatening language demonstrated no significant correlation between any one lexical or grammatical feature or combination thereof and the fulfillment of a threatened act (Gales, 2010); this supports studies questioning the use of linguistic form as an indicator of behavior (e.g., Lord, Davis, & Mason, 2008). Instead, Gales investigated the function of lexical and grammatical markers of authorial stance (Biber, Johansson, Leech, Conrad, & Finegan, 1999), a rich interpersonal resource used to create attitudinal meaning, position social actors, and demonstrate commitment and intent (Martin & White, 2005). Using both corpus and discourse analytic methods on the authentic threats in CTARC, Gales (2010) found that regardless of a threat’s actual outcome, linguistic markers of intent manifest in ways that both adhere to and violate current threat assessment frameworks and expected social

norms. For example, threateners who carried out their threats used language that both strengthened *and* weakened their perceived level of commitment, as in the Zodiac Killer's use of *shall* and *will* as modals of determination and intent in "I *shall* (on top of every thing else) torture all 13 of my slaves" and "I *will* do something nasty" versus the killer's use of the possibility modal *may* in "As some day it *may* hapen that a victom must be found" (Academy Group, 2009). Furthermore, working from the idea that when interpreting intentionality there is a great difference "between actual intentions and clues to such intentions" (Shuy, 2003, p. 444), Gales (2011) found that by applying rigorous forms of discourse analysis such as appraisal (Martin & White, 2005), analysts can move beyond a focus on linguistic forms as a measurement of intent and examine a variety of linguistic manifestations of authorial meaning. For instance, in the analysis of one Army of God threat, despite the highly frequent occurrence of the possibility modal *may*, which provides a lower *perceived* level of commitment, the analytic tools of appraisal revealed a deeper connection to the documented behaviors of religious terrorists, who set aside personal doubts or objections to support a higher cause (Gales, 2011). Thus, these linguistic findings problematize current threat assessment frameworks and stress the need for further interdisciplinary research that utilizes rigorous methods of linguistic analysis.

Conclusions

The process of assessing intent in potentially dangerous threats is a vital part of the threat assessment process. Yet the linguistic features in current assessment frameworks and scholarly literature have been shown to be empirically unreliable as direct indicators of behavior (Gales, 2010), reinforcing the fact that "speakers and writers do not always directly match their words with the meaning that they intend to convey" (McMenamin, 2002, p. 74). Thus, for investigative purposes, discourse and corpus analytic methods that examine inferred meaning in other areas of forensic linguistics (e.g., topic and response analysis; Shuy, 2003) should be applied to authentic threatening language so that collaborative, interdisciplinary research can continue to nuance our understanding of the relationship between the function of linguistic forms and their application to criminal concerns.

Linguistic Analysis of Disputed Meanings: Trademarks

RONALD R. BUTTERS

Trademark (legally often shortened to *mark*) is a term used commonly to describe words and images that are intended to distinguish uniquely the commercial source of a product or service from that of competitors. Marks may designate companies (e.g., McDonald's) or noncommercial entities (Duke University); products (McDonald's McNuggets, Big Mac, etc.); or services (Federal Express); and they may be names (such as the foregoing examples), slogans (e.g., McDonald's "I'm Lovin' It"; Federal Express's "The World on Time"), or specific images (such as McDonald's famed "golden arches," Federal Express's signature red-and-blue lettering in their alternative mark, FedEx, or Duke University's blue shield logo and "Blue Devil" mascot; see Figure 1). Governments' granting of exclusive ownership of trademarks to the users confers great value to their owners, who would have little reason to invest in new product design, quality control, and advertising if they had no way to identify and promote their products to the public. The corresponding restriction upon the general public's freedom of expression likewise benefits consumers, who gain the potentially valuable assurance that they can (a) rely on familiar and established appellations as indications of the quality and nature of their purchases; and (b) readily identify and distinguish new products that they may learn about through advertising or word of mouth.

Trademarks are quite distinct from *copyrights*, which are exclusive licenses that governments grant to the creators of works of musical and visual art, and to authors of fiction and nonfiction (Butters, in press). Unlike trademarks, copyrights are granted not for purposes of product or service identification, but rather with the intent of allowing artists to control the sale and distribution of their creations, thereby controlling any profits that may come from commercial use. Trademarks never expire so long as the owners continuously use them. Copyrights, however, are granted for a finite number of years, at the expiration of which the works that they have protected move into what is called the *public domain*, which means that anyone thereafter is free use them for any purpose. Trademarks are also to be distinguished from *patents*, which governments grant to the creators of new inventions (again, for a fixed period of time, and, again, so that the inventors can profit from sale, lease, or licensing). Together, patents, copyrights, and trademarks are called *intellectual property*.

Because governments create linguistic intellectual property—and regulate its use—through systematic legal processes, the study of trademarks is of general interest to general linguists (Shuy, 2002a, 2002b, 2008; Okawara, 2006; Durant, 2008), lexicographers (Landau, 2001; Adams, 2005), onomastics scholars (Slovenko, 1984; Tamony, 1986), and the broad academic field of language and law (Richardson, 2004; Adams & Westerhaus Adams, 2005; Solan & Tiersma, 2005; Hotta, 2007b; Hotta & Fujita, 2007; Dinwoodie, 2008). Moreover, to the extent that the courts in various countries allow linguists to testify in trademark disputes (as they frequently do in the United States and some other countries), forensic trademark linguistics is a prominent strand in applied linguistics, along with other sorts of forensic applications to civil law practice such as product warnings and contract interpretation.

Figure 1 Slogans and logos: (a) McDonald's golden arches and slogan; (b) FedEx trademark and slogan; (c) Duke University shield logo; (d) Duke University Blue Devil mascot logo

Trademark disputes arise because trademark owners detect or suspect an invasion or possible invasion of their intellectual property. Through various legal channels, they can prevent competitors from encroaching on their marks in ways that could confuse the public as to origin and therefore (a) damage their reputation through the marketing of inferior or disreputable products (also a feature of *dilution*, a grounds for legal action in its own right; see below); or (b) unfairly divert customers to competitors who could benefit from the owner's advertising and respected name (technically sometimes called *deception*).

Trademark disputes take place typically between the owners of older, established marks (termed the *senior mark*), and newer, allegedly encroaching marks (the *junior mark*). The senior mark will have become the owner's legal intellectual property in one or two ways: (a) simply using a trademark in commerce in itself creates common-law rights; (b) the mark may be registered with a government agency (such as the United States Patent and Trademark Office, or USPTO). Registration affords stronger protection than common-law rights. International registration is also possible, though sometimes complex (registration in one country does not automatically confer worldwide rights).

There are also two different forums in which a junior mark may be challenged. First, when the owner of a new mark proposes the mark to the government for registration, a waiting period ensues in which owners of established marks may contest the registration, usually on the grounds of *likelihood of confusion*. The government conducts an investigation and, if necessary, what is in effect a trial (in the United States, this process is administered by the Trademark Trial and Appeal Board, or TTAB), and decides whether there is enough similarity between the two marks to warrant denial of registration.

Second, it sometimes happens that (a) the owner of the junior mark will simply start using it without having received (and sometimes without having even applied for) USPTO registration; or (b) one of the parties decides to appeal the TTAB decision to a federal court. In case (a), the senior mark owner takes the junior owner to court for trademark infringement, asks the court to order the junior owner to stop using the allegedly infringing mark, and usually demands to recover court costs and damages. Again, the fundamental basis for such a claim is likelihood of confusion.

Among the most important criteria for judgment of likelihood of confusion are (a) evidence of actual confusion, (b) competition in competing channels of trade, and (c) similarity of *sight*, *sound*, and *meaning* of the marks themselves.

Instances of actual confusion do occur; however, cases involving actual confusion do not normally require expert testimony, and actual confusion is not required to prove a case. Similarly, the competitiveness of two firms with respect to channels of trade is

not a question that linguists usually are prepared to deal with. The likelihood that, for example, Delta Airlines and Delta Faucets are not competing for the same customer pool is not a linguistic issue, nor is the relationship between Apple Music and Apple Computers, which coexisted without conflict for years in different channels of trade until Apple Computers began marketing downloadable music on the Internet (at which time a trademark conflict arose).

Linguists are, however, professionally qualified to assess similarities of competing marks to the extent that their scientific training and research interests encompass lexicography, lexicology, orthography, phonology, morphology, dialectology, and semiotics. Lawyers have called upon linguists for at least 40 years to present expert analysis of the similarities and differences between numerous marks. A very brief sampling includes the American snack foods *Frito-Lay* chips and *Jay's* chips (McDavid, 1977); English nappies or diapers *Bambino Mio* and *Bambineo* (Heffer, 2008); Chilean food products *Paltomiel* and *Palto con Miel* (Oyanedel & Samaniego, 2004); American food products *Healthy Choice* and *Healthy Selection* (Shuy, 2002b); domain names (*oracle.com* versus *oraclecontractors.com*) incorporating the trademark *Oracle* (Olsson, 2008); American retail establishments *McSleep*, a mark proposed for a chain of budget hotels, and *McDonald's* (Lentine & Shuy, 1990; Shuy, 2002b); pharmaceutical company names *Aventis* and *Advancis* (Butters, 2008b); commercial slogans *Whisper Quiet* (Butters, 2005) and *Life's Good* (Butters, 2007b); South African pharmaceutical remedies *Allergan* and *Allertac* (Sanderson, 2007); and the marks *Mobil* (Oil) and *Mobile* (for "sporting articles, games, and playthings") in Australia (Eades, 1994).

A second cause for trademark disputes in which linguistic testimony is frequently called for is technically known as *strength of mark*. A typical defense of a junior mark when challenged by a senior mark is that the senior mark is not really strong enough to be a trademark at all. Trademark law sorts trademarks into five different categories (in descending order of "strength"), two of which are considered too weak to be legitimate marks.

Fanciful marks are the strongest of all: they are made-up words (at least with respect to the perceptions of the consumers). For example, *Kodak* is a famous name used by a company and its products—originally in photography, but today also associated with computers. *Kodak* meant nothing at all in English until it was invented for use as a trademark.

Arbitrary marks will ordinarily be perceived by consumers as "real" words that can be found in a dictionary. However, they have no apparent semantic connection with the product or service to which they refer as a mark. Thus for example, *Apple Computer* and *Apple Music* are arbitrary trademarks: computers and music have nothing to do with apples. The two are thus strong marks that are fully protectable.

Suggestive marks are also strong enough to be fully protected, and they are sometimes considered the ideal mark because they have recognizable positive connotations that the owners of the mark would like to have the public associate with the product or service, even though by definition the names do not denote literally and directly an important aspect of the thing being offered to the public. For example, the trademark *Rabbit* applied to a type of Volkswagen automobile presumably was expected to convey positive associations of reliability, cuteness, endurance, and the ability to hop from place to place that the idea of a rabbit conveys.

Descriptive marks are said to be inherently weak, and they can be fully protected as legitimate trademarks if they acquire and maintain in the minds of the relevant public what is technically called *secondary meaning* (see below). *Descriptive* means that the word or words that make up the mark merely depict or refer to some inherent feature of the product or service and/or are laudatory morphemes such as *best*, *king*, *max*, or *super*. For example, *Super Suds*, a trademark used for a kind of laundry soap marketed in the mid-20th century in the United States, was arguably a descriptive mark, since *super* is a laudatory term and *suds* are what laundry soap of the era characteristically did in use.

(As the name for a car-washing service, however, *Super Suds* would arguably be more suggestive than descriptive.)

Descriptive terms cannot be afforded trademark protection unless they are adjudged to have become so famous as to have acquired *secondary meaning*: that is, the association in the minds of potential consumers between the company and the brand name is so strong that, one might say, it has become a widely recognized lexical item in its own right; *Burger King* would seem to be just such a famous mark. However, trademarks that have been registered and uncontested for several years are considered by law to have secondary meaning, regardless of how substantial their accrued fame may in reality be.

Generic terms are the weakest, and they can never be used as trademarks for the type of thing designated, for they are the name not of a brand of product or service but of the thing itself. For example, *detergent* is the generic term for substances used for cleaning purposes. Thus *Detergent* is not a legitimate trademark for detergent (though it might be a protectable suggestive mark for a puppy-training service or even, arguably, a dry-cleaning service, and it could also be a protectable arbitrary mark for a musical group). Similarly, *toothpaste* generically names a product of which there are many brands and cannot therefore ever be a brand name for toothpaste.

Many trademarks appear to have characteristics of more than one strength-of-mark category. Thus, deciding where a mark fits best with respect to the categories “suggestive” and “descriptive,” and whether or not a mark is truly generic, frequently leads to occasions for litigation in which one side argues that the other side’s mark is too weak to be afforded protection. The issues in such cases are ripe for linguistic analysis, and linguists have frequently opined under oath in expert reports and court testimony about just where particular marks fit into the continuum of trademark strength. For example, Butters (2008b) reports on a case involving semantic analysis of the mark *Zingers*, used by two rival restaurant chains as a menu term for chicken wings served in a hot sauce. The salient question was whether the meaning of *zinger* described the experience of eating the hot-sauce-covered item, or if it merely suggested it (or, indeed, had become generic for this particular product). The difference between a descriptive and suggestive classification in such cases lies significantly in the *degree of imagination or mental leap* needed to connect the mark with its referent.

The allegation of genericness is especially serious because, according to the common law, once a mark has been declared generic for a certain use, it can never become non-generic, no matter how much secondary meaning it may acquire. Furthermore, nongeneric terms may become generic through use (a process sometimes referred to as *genericide*), as was the case in the United States with such words as *aspirin*, *escalator*, *trampoline*, and *Murphy bed* (a bed that folds into a wall when not in use). The fundamental test for genericness is whether the public who are potential users of the product or service think of it as generic, or whether they relate it to some particular source or origin.

Courts allow evidence from direct questioning of the public to be introduced as evidence, but they also allow linguistic analysis based on the use of lexicographical methodology. Linguists who consult on trademark issues thus usually examine actual use of the contested marks in various media, including print documents, television, movies, and all manner of Internet sources. Earmarks of genericness include lack of capitalization (*trampoline* instead of *Trampoline*), use as a verb (*Did you trampoline today?*), use by other competitors (*Super Fun Trampolines* as well as *Nissan Trampolines*, the name of the inventor and original trademark owner), and contexts in which the mark is contextually unquestionably generic (*What brand of trampoline do you wish to buy?*). Presence of the trademark designators ® (indicating that the mark has been registered) and ™ (indicating a common-law trademark or one for which trademark registration has been applied) attached to the trademark itself can also be considered evidence that the user considers the mark to be nongeneric. Even so, the arguments

in such cases can be quite complex, owing in part to the fact that people sometimes use famous marks in a shorthand way, knowing that they are actually trademarks and differentiating if and when it becomes important to do so. Marks that fit this category may be termed *pseudogenerics*, and seem to include in the United States such famous brands as *Kleenex*, *Band-Aid*, *Google*, and *Xerox* (Butters, 2008a: 514; Butters & Westerhaus, 2004; see also Landau, 2001, on *Band-Aid*, and a useful list in Clankie, 2002). One factor that strongly discourages arguments that such marks are generic is the presence in the language of genuine generic terms for the things so designated: *Kleenex tissues*, *Band-Aid bandages*, *Google search engines*. No such ready alternative generics exist for *aspirin*, *escalator*, *trampoline*, and *Murphy bed*.

Numerous cases are reported in the forensic linguistic literature in which linguists have been consulted for reports and testimony involving genericism. Some examples are as follows (the marks written here with upper-case letters were found not to be generic by one or more courts): the airline-industry term *air shuttle* (Bailey, 1984); *kettle chips* and *steakburger* (Butters, 2007a, 2008a, 2009b); *Beany Baby* for soft dolls (Butters, 2001, 2007a); *Opry*, as the performance company *Grand Ol' Opry* (Butters & Nichols, 2009); and even one case involving only a semiotic feature, , of a trademark icon used in the labeling of a brand of cleaning products and a brand of automotive products (Butters, 2004).

There is a third source of litigation about trademarks that linguists sometimes are involved in as experts. Federal trademark law disallows registration of marks that are deemed immoral, deceptive, scandalous, or disparaging. In one such case, a group of Native Americans attempted (unsuccessfully) to cancel the registered and long-established trademark of a sports team, the Washington *Redskins*, on the grounds that it was derogatory (see Butters, 1997, 2007c, 2009a). Baron (1989) reports on a case in which "Glass Wax, a glass cleaner which contains no wax, successfully defended its trademark against a charge that the name was deceptive." He also notes, "in the early 1900s the courts refused to recognize *Madonna* as a trademark for wine because it was ruled scandalous."

One final aspect of trademark law that can call for the expertise of linguists is what is known as *dilution*, which at its simplest means only that the existence and use of one mark lowers the value of another. The damaged trademark need not even be in the same area of trade as the infringing mark, and, where it is, senior trademark owners often add "dilution" to the list of wrongs that they allege to suffer by the use in trade of junior marks.

To sustain a dilution claim, the infringed-upon mark must be "famous." For example, at least in theory, McDonald's restaurants could bring suit against the publisher of a pornographic magazine that called itself *McDonald's*. The restaurant chain also could attempt to prove dilution of their famous mark if, for example, a business even so far removed from the restaurant business as a chain of hair-styling salons began calling themselves *McDonald's*. Dilution has interested some forensic linguists and specialists in language and law, and applications of linguistic expertise to questions of dilution include (a) whatever a linguist might contribute to the discussion of fame; (b) the potential evaluation of likelihood of confusion that might come about through use of semiotic similarities between the putative infringer's use of the mark and that of the infringed-upons, as for example in color and typeface of the mark itself; and (c) whether the use of the mark is really disparaging in the alleged context. For discussion, see Hotta (2007a), Butters (2008a), and Shuy (2008).

Linguistic Approaches to Translation

DOROTHY KENNY

Introduction

This entry is concerned with how linguistic theory has been applied in translation studies. In some cases, scholars have sought to explain translation using an existing, more or less complete linguistic theory. In other cases, linguistically informed commentators have drawn on an often eclectic range of sources to elucidate aspects of the relationship between a given source language (SL) and target language (TL), or source and target text, or to highlight features of source texts that may have to be attended to in translation. Linguistic theory has also informed discussions of how translated texts can differ from other texts in the same (target) language, and of how decisions made by translators can impact on relations, including power relations, between addressor and addressee.

The broad uses to which linguistic theory has been put in translation studies are discussed below roughly in chronological order. In the course of our discussion we introduce some of the linguists whose theories have been influential in translation studies and address a number of issues that become particularly acute in translation situations and about which linguistic theory has something to say. These issues include equivalence, translatability, translation shifts, and the unit of translation. We start, however, with an issue that is singularly relevant to most linguistic approaches to translation: their pedagogical import.

Translation Pedagogy

More so than any other (e.g., cultural, sociological, or computational) approach to translation, linguistic approaches have been associated with the training of translators. This may be partly explained by the institutional contexts in which translation was taught in the mid-20th century, namely university departments of language and linguistics (Pym, 2010, p. 49). But linguistic approaches offer benefits to translation teachers regardless of institutional context: linguistics as a discipline attempts to deal systematically with language data, allowing more or less exhaustive analyses of linguistic structure at varying levels (phonological, morphological, syntactic, semantic, textual, discourse). Because of its systematic, hierarchical nature, linguistics lends itself to pedagogical application, allowing teachers to adopt a “building block” approach to the discussion of language and text. Even if such an approach might be ultimately considered “naïve” (Baker, 1992, p. 5), it still allows a clarity of exposition that is welcome in educational contexts. Indeed, it is an approach adopted, wholly or in part, in a number of highly regarded textbooks in translation including Baker (1992), Malmkjær (2005), and Routledge’s *Thinking Translation* series.

Linguistics also provides a fairly comprehensive metalanguage with which teachers and students can explain translation phenomena and justify their own translation decisions. Thus, while few people would argue that successful translation practice relies on knowledge of linguistics or any particular theory of translation, such knowledge does enable translators to become more self-reflexive and better able to take responsibility for their actions, thus contributing to their professionalism.

The close association of linguistic approaches with translation pedagogy has its downside, however. It is perhaps responsible for the labeling of some linguistic approaches as “prescriptive,” as the educator’s desire to inform and guide practice (Baker, 1992, p. 5) is sometimes supplanted by an impulse to prescribe practice, an impulse that has been identified in the linguistically oriented work of Vinay and Darbelnet (1958, 1995), Nida (1964), Nida and Taber (1969), and Newmark (1988), for example. The irony here is, of course, that linguistics itself endeavors to be descriptive rather than prescriptive and there is no natural link between linguistic approaches to translation and prescriptivism.

Early Linguistic Approaches to Translation

Discussions of translation that draw on linguistic theory generally began to emerge in the late 1950s against the backdrop of structuralist linguistics (Pym, 2010, pp. 9–11). Structuralists argued that each language is unique, that the formal categories with which we analyze two different languages rarely coincide, and that each language reflects its own view of the world. These views suggested that translation between languages would be impossible, yet translation was an empirical fact. To account for this empirical fact, early linguistic approaches to translation shifted the focus away from language *systems*, with all their unactualized meaning potential, to language *use*, in which individual words actually signified something more tractable, even if momentarily. They showed how translations could operate at different linguistic levels, so that if it was impossible to use a feature of English grammar, for example, to translate something that had been said using a feature of Russian grammar, then it might still be possible to use a lexical item in English to get the meaning across (see Catford, 1965). Another way to “defend” translation (Pym, 2010, p. 12) was to catalog the techniques used by translators to overcome difficulties that arise precisely when languages do not match up structurally, or a source-culture item has no obvious counterpart in the target culture. The best known such catalog is that developed by the comparative linguists Vinay and Darbelnet (1958, 1995). Among the most useful techniques they list (Vinay & Darbelnet, 1995, pp. 31–42) are:

transposition, which involves replacing a word (or words) of one class with a word (or words) of another class. Hence the nominal *son lever* “his rising” in *Dès son lever . . .*, literally “From his rising . . .” becomes a verbal structure in the translation “As soon as he gets up/got up”; and

modulation, which involves a change of point of view. Hence the negative expression “It is not difficult to show . . .” becomes the more positive *Il est facile de démontrer . . .* “It is easy to show . . .”

Other theorists developed detailed taxonomies of translation procedures that attempt to capture systematically the ways in which source and target text fragments can differ, for example, in terms of their structure, or completeness (something might be added or taken away in the translation), or in terms of the elements of a situation that they represent. Fawcett (1997, pp. 27–52) provides a useful overview of the relevant literature and frequent criticisms of the approach. One criticism is that “translation techniques” are more about contrastive differences between languages—which experienced translators have internalized anyway, and hardly need to be reminded of—than actual translation practice.

Catford

The work of J. C. Catford stands out as probably the most exhaustive attempt to date to apply an existing general linguistic theory to translation. His approach is based on an early version of M. A. K. Halliday's systemic functional grammar (SFG), although the influence of J. R. Firth is also acknowledged. Central to Catford's theory of translation is the idea that meaning is language specific. This language specificity arises from the Firthian view of meaning as "the total network of relations entered into by any linguistic form" (Catford, 1965, p. 35), where such relations are either formal or contextual. Formal relations arise between a linguistic form and other linguistic forms in the same language, and are necessarily language specific. Contextual relations arise between grammatical or lexical items and linguistically relevant elements in the situations in which those items are used. What is "linguistically relevant" differs from language to language: French, for example, signals the gender of the speaker/writer in sentences like *Je suis arrivée* (where the final *e* on *arrivée* shows that the speaker/writer is feminine) while English can remain neutral with regard to gender in the "equivalent" *I arrived*.

The language specificity of meaning posited by Catford means that translation cannot be viewed as a "transference of meaning" (Catford, 1965, p. 35) or a "transcoding" of language-independent messages, an idea that had been popularized by the information-theory inspired approach of Warren Weaver (Catford, 1965, p. 41). Catford opts for a seemingly more prosaic definition of translation as "the replacement of textual material in one language (SL) by equivalent textual material in another language (TL)" (p. 20). This is a definition in which the word "equivalent" comes to bear a heavy load, but as Catford later explains (p. 50), as long as SL and TL texts (or other linguistic items) are relatable to at least some of the same features of "situation substance" (a construct akin to an extralinguistic reality), then they can be considered as translation equivalents.

Catford discusses two types of relationships relevant to translation equivalence: formal correspondence and textual equivalence. Formal correspondence is said to exist between categories (e.g., word classes, clausal structures, etc.) which are seen as occupying more or less the "same" place in the "economies" of a given SL and TL. Formal correspondence is always only approximate, and sometimes it makes little sense to seek it at all (p. 82), but the notion allows Catford to develop a further concept, that of translation shifts, to which we return below. Catford's textual equivalence is "an empirical phenomenon, discovered by comparing SL and TL texts." A textual translation equivalent is thus defined as "any TL form (text or portion of text) which is observed to be the equivalent of a given SL form (text or portion of text)" (p. 27). Textual translation equivalents often provide evidence of departures from formal correspondence, and it is these departures that Catford labels "translation shifts" (p. 73). Thus when a subject–predicate–complement sequence in English becomes a predicate–subject–complement–adjunct sequence in Scottish Gaelic, we are dealing with what Catford (p. 77) labels a "clause-structure shift." Catford goes on to develop a typology of translation shifts that occur at or below clause level, and then opens out his analysis to include issues of dialect and register in translation, and linguistic and cultural untranslatability. Linguistic untranslatability occurs where formal features of the source text are functionally relevant but cannot be matched by corresponding formal features in the target text (p. 94). This happens, for example, in the case of some puns. Cultural untranslatability occurs where a situational feature that is completely absent in the target culture is functionally relevant for the source text (p. 99). Translators can overcome this problem by transferring the source text item into the target text—a procedure Vinay and Darbelnet (1958, 1995) call "borrowing"—with or without further explanation (Catford, 1965, p. 100). Catford concludes by claiming that in some cases of apparent cultural untranslatability, translation solutions are possible, although they may produce

abnormal collocations in the target language. Thus cultural untranslatability may be reducible to linguistic untranslatability (p. 101).

Although Catford's theory has come in for some criticism in translation circles (see Fawcett, 1997), his legacy is nonetheless important: the notion of translation equivalence as an empirical phenomenon was to be taken up again, most influentially by Toury (1980, 1995). Translation shifts remained important as descriptive categories in (human) translation studies (Pym, 2010), although they took on greater complexity in subsequent treatments, and they never lost their relevance for rule-based machine translation (MT). Likewise, the relevance to MT of the probabilistic textual translation equivalents that Catford wrote of has grown as statistics-based MT has developed. Finally, Catford blazed a trail in applying Hallidayan grammar to translation analysis.

Nida

While Catford drew predominantly on a single linguistic theory to account for translation, his contemporary, the Bible translator Eugene Nida, was more eclectic in his approach. Among the many sources Nida draws on, Noam Chomsky's early transformational generative grammar is described as "particularly important" (Nida, 1964, p. 9). Chomsky (1957) theorized that the sentences of a particular language could be represented at two levels: a deep structure (or "kernel"), which represented the basic semantic relations of the sentence; and a surface structure, which could be generated from deep structure through a series of "transformations." Chomsky (1965) further proposed that deep structures might reveal properties that were common to all languages, but warned that the existence of such universals did not have any implications for translation. Nevertheless, Nida proposed that when translating complex SL sentences or phrases, translators should first reduce those sentences to simplified kernels, in which objects, events, abstractions, and relations would be represented. Such kernels could then be "transferred" into the TL, and translators could "generate" appropriate surface structures through a series of transformations. Such a procedure appeared attractive to Nida because he held that:

languages agree far more on the level of the kernels than on the level of the more elaborate structures. This means that if one can reduce grammatical structures to the kernel level, they can be transferred more readily and with a minimum of distortion. (Nida & Taber, 1969, p. 39)

Nida's application of early Chomskyan linguistics has been roundly criticized in the translation studies literature. Fawcett (1997, p. 67) finds Nida's approach to kernel analysis complex, vague and unnecessary in much translation, while Gentzler (1993) argues that it reveals a mindset in which the (Bible) translator has privileged access to the deep meanings of God's truth, and that the use of Chomskyan linguistics thus serves Nida's evangelical mission more than his attempt to put the study of translation on a scientific footing. Indeed, although Chomsky's early work found application in other declaredly "scientific" approaches to translation (e.g., Malone, 1988), Chomsky's influence on translation studies has been short lived.

Nida's work is more notable for its sociolinguistic orientation and its incorporation of reader response, however. Nida (1964) distinguishes between two basic orientations in translating: the first privileges "formal equivalence" by focusing attention on the source message in both its form and content; such a translation might involve literal translations and explanations of source-culture customs in the form of footnotes, for example. The second privileges "dynamic equivalence" (renamed "functional equivalence" in Nida &

Taber, 1969) and aims to reproduce on the TL addressee the effect that was originally produced on the SL addressee. Thus rather than insisting that readers understand source-culture practices in order to understand biblical messages, the translator may opt for a more natural TL rendering that will be understood more readily in the target context. Hence the New Testament translator, J. B. Phillips, translates a phrase that literally means “greet one another with a holy kiss” (Rom. 16:16) as “give one another a hearty handshake all around” (Nida, 1964, p. 161). Criticisms of Nida’s dynamic equivalence are many and varied (Fawcett, 1997, pp. 56–60): it is often impossible to check reader responses for equivalent effect, for example, and translations that aim for dynamic equivalence may suppress the “Otherness” of the source text. The general concept of reader response remains an important one in much of translation studies, however.

A final word is said here about Nida’s approach to meaning. Like Catford (1965), Nida (1964) appears to be clear that there can be no language-independent meaning. Nevertheless, he does appear to endorse the possibility of universal *messages* (Nida, 1964, pp. 182–3), a position that is no doubt relatable to his activity as a Bible translator.

Textual and Contextual Approaches

While some of the linguistic approaches to translation discussed so far concentrate primarily on lower linguistic ranks, rarely moving above the level of sentence, later linguistic approaches focus on whole texts, integrating insights from text linguistics, genre, and register analysis in particular. A genre is understood here as a conventionalized text form associated with a particular social occasion or communicative event (e.g., a death notice, or a letter to the editor). Register is generally understood in Hallidayan (Halliday, 1985) terms, and denotes features of texts that are related to the context loosely in terms of the subject being addressed (the field), the relationship between addresser and addressee (the tenor), and the medium in use (the mode, e.g., informal spoken vs. formal written). Reiss (1981, 2000), for example, classifies texts using Bühler’s (1933) three functions of language (informative, expressive, operative) and claims somewhat prescriptively that it is primary text function that determines the general method of translation, while the genre also influences translation decisions. Text function is also addressed by House (1977/1981, 1997), who draws on Halliday’s three metafunctions of language (ideational, interpersonal, and textual), as well as register analysis, to devise a scheme for translation quality assessment. A number of theorists (e.g., Baker, 1992; Fawcett, 1997; Malmkjær, 2005) consider text linguistic concepts such as cohesion, coherence, and thematic structure, in their discussions of how “texture” is created in translation and the same theorists also go beyond the “words on the page” to consider what is implied (conventionally or otherwise) in source texts and their actual or potential translations, thus extending their analyses to the realm of pragmatics. The work of Hatim and Mason (1990, 1997) is particularly focused on higher linguistic levels and integrates insights from pragmatics, rhetoric, sociolinguistics, and ideologically oriented studies of discourse. Their analyses demonstrate, for example, how variables such as politeness and power impact upon strategies used in counter-argumentation in English and Arabic.

Close attention to linguistic choices and their ideological import is a hallmark of approaches to translation based on critical discourse analysis (CDA). Scholars in this area may, for example, analyze how the translator’s choice of particular lexical items or transitivity patterns (the ways in which the participants in a process are represented in a clause) can perpetuate or depart from a particular institutionalized discourse. The survey of relevant work in Saldanha (2009) shows that CDA-influenced research has been a growth area in translation studies since the 1990s.

Over much the same period, corpus linguistics has also made its mark. While it is mainly corpus linguistic methodologies that have been incorporated into translation studies, the linguistic theory of the lexicographer John Sinclair (1991), which builds on Firth's (1957) notion of collocation, has also been influential (see Kenny, 2001, 2006; Malmkjær, 2005). Finally, cognitive approaches to translation (see articles in Alves, 2003; Halverson, 2003) share a number of concerns with linguistic approaches. These include the extent of "translation units" (the textual units with which translators work, whether these are individual words, whole clauses, or even whole texts) and "translation universals," understood as recurrent features of translation (such as relatively high levels of explicitness) that can be detected by linguistic or corpus linguistic analysis.

Conclusion

Linguistic approaches to translation have evolved in line with linguistics itself, and nowadays tend to be more critical and contextually aware than they were in the early days. Contemporary linguistically oriented translated scholars are generally alert to how their approach relates to complementary or competing approaches (see Saldanha, 2009), and are unlikely to claim that linguistic theory can account for all translation phenomena, as Catford appeared to do in the 1960s. The enduring strength of linguistic approaches lies in their ability to link facts about texts to elements of the contexts in which those are translated and received, using a rich array of analytical categories.

Linguistic Creativity and World Englishes Literatures

YAMUNA KACHRU

Introduction

A three-year-old asks her mother to push her swing higher. The mother pushes the swing a little more vigorously. The child yells, *High, mummy*. The mother asks, *You want it higher?* The child says, *Yes, bi . . . g high*, with a long [iy] sound.

That is one example of linguistic creativity. Another one is: The mother asks, *Do you like your new teacher?* Her six-year-old says, *Yes*. The mother asks, *Just a little or a lot?* The child says, *Super lot*.

The constructions *big high* and *super lot* are novel collocations in place of a comparative, perhaps never before encountered by most speakers of English. But they are readily interpretable in the context. Children as young as three to six are creative in their language use for everyday interaction. In any mode of language use for societal function, creativity is involved. What do we mean by the concept of *creativity*?

Creativity is hard to define: Every discipline has its own definition of the construct. In linguistics, the term has been used in many domains. Creativity has been discussed in the context of syntactic rules that are capable of generating infinite number of novel utterances, for example, in Noam Chomsky's work. It has been used for characterizing idioms, metaphors, and proverbs exemplifying creative use of language in context. It has been employed to describe bilingual people's linguistic behavior of blending two or more languages to create multiple communicative effects. This is evident not only in conversation, but also in advertising, popular culture, fiction, poetry, and other literary genres. Creativity in the area of word formation and derivation of words has been discussed extensively. One can add many more domains to this list.

Linguistic creativity may be defined as the ability to extend the "meaning potential" of language. That is, the speaker/writer exhibits the ability to make new meanings by combining known elements in novel ways or creating new expressions in specific contexts of language use. However, such creativity should make meaning in the given sociocultural context, that is, its expression should be interpretable by participants.

Linguistic Creativity in Everyday Interaction

It is evident that young children demonstrate creativity in language use in everyday interactions with their caregivers. The same is true of all age groups and all human language speakers and writers, including users of other non-oral modes of linguistic communication such as sign language (Joachim, Prillwitz, & Hanke, 1993). The examples below are drawn mostly from Outer and Expanding Circle varieties of World Englishes (Kachru, 1985).

Linguistic creativity in everyday interaction is well illustrated by the following example between colleagues in Malaysia. Two teachers, one Malaysian, one Tamil, are outside a shopping complex in Kuala Lumpur, Malaysia.

Khadijah: Eh Mala, where on earth you went *ah*? I searching, searching all over the place for you—no sign till one o'clock, so I *pun* [also] got hungry, I went for *makan* [to eat; for some food; for a meal].

Mala: You were *makaning* [eating] where? My sister, she said she saw you near Globes—when we were searching for parking space. So *susah* [difficult] one, you know? Went roun(d) and roun(d) nearly six times *pun* [also], no place. That's why so late *lah* I!

Khadijah: So, you ate or not?

Mala: Not yet *lah*—just nibbled some *kari paps* [curry puffs] at about eleven, so not really hungry. (Baskaran, 1994, p. 28; italics added)

These exchanges may be problematic for speakers/readers of English not familiar with the Singapore-Malaysian variety of colloquial English since some items such as *lah*, *pun*, and *makan* are not familiar to them. However, the context makes the meaning of *makan* clear. It seems reasonable to assume that the other items are particles of various kinds with discourse significance (see Pakir, 1992). Other notable features of this fragment of conversation are the grammatical form of the questions in the text, use of tense forms, repetition, missing subjects, and so forth. None of these features are barriers either to comprehending the fragment in question or interpreting it (see Kachru & Smith, 2008, pp. 59–70 for a discussion of *intelligibility*). These innovations make English a local variety for interpersonal communication in the setting in which it is being used.

Such grammatical, lexical, and discourse strategic features (e.g., use of specific particles) have been characterized as “bilinguals’ creativity” in all varieties of World Englishes (Kachru, 1986). The excerpt cited above is different from other varieties of English precisely because the participants in the interaction are bilingual. They are drawing from both the languages in their repertoire, namely, Bahasa Malaysia and English. This is not a 20th- or 21st-century phenomenon. It has occurred repeatedly in the history of the English language. In fact, it is a natural feature of all human languages in contact with other languages.

Contact influences from other languages are no longer so obvious in Inner Circle Englishes (i.e., English spoken in Britain, Ireland, Canada, the United States, Australia, and New Zealand). English speakers in England are no longer necessarily aware of the linguistic impact of the Norman Conquest of the eleventh century. Speakers of General American English are usually no longer conscious of the influence of Spanish, or other European, Native American, and African languages on their English. In Australian and New Zealand Englishes, the process is still ongoing. Therefore, how the resources of Māori and other indigenous languages are being utilized to give these varieties their unique characteristics is a vigorous field of research. The process is no different in African, Asian, Caribbean, European, or Latin American Englishes. English in these regions is in contact with other indigenous languages. The speakers, who are bilingual or even multilingual, blend the languages in their repertoire with English in their own regional settings. Some of these varieties of English have a long history, for example, Indian English has a history at least as long as the American variety, if not longer (Bolton & Kachru, 2007). The modifier “Indian” in this context includes Bangladesh and Pakistan. These countries did not exist in the early 18th century.

Research reports on various aspects of face-to-face interaction in World Englishes are available. They include the concept and strategies of politeness and speech acts, and on structural features such as turn taking, back channeling, and rhetorical organization of discourse (see Kachru & Nelson, 2006; Kachru & Smith, 2008). The influence of language and cultural contact is discernible on all these aspects. The following example from Indian English illustrates how the bilingual participants move between conventions of various codes in their repertoire smoothly:

A phone conversation between a manager and her employee, of which the author could hear only the manager's part:

A: I am here *only*.

B: . . .

A: We can do this *right* now.

B: . . .

A: I should do this again, *na*? (Recorded by the author on December 25, 2010)

The use of *only* in the first turn followed immediately by *right* in the next turn is puzzling unless one realizes that for the speaker, the use of either the Indianized limiter particle or the Inner Circle English one is equally grammatical and acceptable. In this context, *only* is equivalent to the limiter particle *hii* 'only' in Hindi. The use of *na* in the last turn is similarly motivated by the Indian context of interaction: It is equivalent to the confirmation-seeking use of *right?* in Inner Circle Englishes.

The speaker is a young woman who was educated through the medium of English, majored in English at a prestigious college in Delhi, and has had higher education at the University of California at Berkeley. She has also traveled and lived in England, Scotland, and Continental Europe. Thus her competence in English is not an issue; she is following what will be the norms of interaction in her own sociocultural setting no matter which code she uses—English or Hindi.

An example from Chinese English is reproduced here to illustrate what is meant by *rhetorical organization of discourse*. Following a talk given by a Chinese visiting professor of nutrition from Beijing, an American in the audience raised a question. The following exchange took place:

American: How does the Nutritional Institute decide what topics to study? How do you decide what topic to do research on?

Chinese: **Because**, now, period get change. It's different from past time. In past time, we emphasize how to solve practical problems. Nutrition must know how to solve some deficiency diseases. In our country, we have some nutritional diseases, such as x, y, z. **But**, now it is important that we must do some basic research. **So**, we must take into account fundamental problems. We must concentrate our research to study some fundamental research. (Young, 1982, p. 76)

An Inner Circle listener expects an answer to the question followed by any justification for the point made. However, the Chinese professor is following the rhetorical strategy he is familiar with. In his conception of persuasive interaction, one must first provide the background, which generally consists of the history of the endeavor, and then slowly unfold the main point. The historical facts justify the point being made. The linkers in bold face above (**Because**, **But**, and **So**) are the markers of this organization. The statement in italics constitutes the answer to the question, which comes at the end of the discourse rather than at the beginning.

Linguistic Creativity in Writing

Writing in World Englishes exhibits the same characteristic: hybridization motivated by sociocultural factors. This is not the place to go into the details of text types and their characteristics. All written texts, just as spoken texts, convey sociocultural meaning. These meanings are imparted by the choice of linguistic items as well as the overall structure of

texts. Written texts communicate not only the content of the text, but also the writers' beliefs and attitudes toward the content and the sources from which the material for the content are drawn.

The varieties of World Englishes exploit essentially the same linguistic items to express contextually appropriate cultural meanings in various genres. An example of an identical speech situation calling for various subgenres is a wedding. One subgenre associated with weddings is that of a written invitation to the event. In the American context, the invitation may be from the bride and the groom themselves, sometimes with no mention of their parents. In the Indian context, a wedding invitation printed in English has to be preceded by an oral, face-to-face invitation, or a written apology for extending the invitation through the written medium only. Invitations are sent out to two sets of invitees, that is, to their respective kin and friends, by the bride's and the groom's families. The elders in the family, usually the grandparents of the bride and the groom, are projected as hosts. The parents, and usually all uncles and aunts, are listed as hosts. The invitations are usually very elaborate, with several cards giving details of all social rituals and their dates and timings.

These two differing conventions follow from the goal of invitations in the two sociocultural settings. In the Inner Circle, the extending of invitations is for maintaining solidarity with family and friends, for celebrating the event, and for inviting people to wish the couple well. In the Indian context, the purpose is also to identify the extended family unit and reinforce family solidarity for internal as well as external acknowledgment. Weddings are between families, not between individuals. It is a social event for reaffirming the families' position within their social network. The genre of written invitation, nativized to reflect these values of Indian culture, thus differs from the Inner Circle genre in crucial respects.

In persuasive writing, there is a difference between how the texts are to be structured. In the Inner Circle context, the texts usually have a direct, linear form. In the Asian context, that may not be the preferred way of constructing one's arguments. In academic writing, the emphasis is on objectivity in the Western tradition and arguments are based on facts and logic. In the Asian context, texts frequently carry markers of personal involvement of the writer with the topic as well (Kachru, 1992; Kachru, Kachru, & Nelson, 2006, pp. 347–402).

Literary Creativity in World Englishes

Literatures in World Englishes, such as Indian, Southeast Asian, Caribbean, have given rise to multiple canons in addition to the American, Australian, Canadian, English, Irish, and other Inner Circle ones. That is, again, due to the sociocultural contexts of the Outer and Expanding Circle Englishes. As Kachru (2006) explains, World English literatures share the *medium*, but not the underlying *message*, since the messages of these literatures are in accord with their individual ecosystems (Thumboo, 1985). The following three crucial realities dictate the distinct identities of African, Caribbean, Indian, Philippine, or Singaporean, English literatures:

- First*, . . . the medium is shared by two distinct types of speech communities: those that perceive themselves as monolingual and those that are *multilingual* and *multicultural*.
- Second*, . . . there is a long tradition of distinct literary and/or oral traditions and mythologies associated with these communities; and
- Third*, . . . they represent distinct repertoires of stylistic and literary creativity. (Kachru 2006, p. 456)

One needs to know something about the salience of certain cultural themes (Spradley, 1979) for a people to interpret even the titles of literary works, for example, *The Bone People* by the New Zealand Māori writer Keri Hulme (see Tawake, 1993, for an explanation). The following excerpt from a South Asian novel needs familiarity with Indian sociocultural conventions to interpret the text:

"This heat has given me a headache," he complained and stood up. "I am going to bed."
 "Yes, you must be tired," agreed his mother. "Champak, *press* his head, he will sleep better."
 "I will," replied Champak, standing up. She bent her head to receive her mother-in-law's blessing. "*Sat Sri Akal*."
 "*Sat Sri Akal*," replied Sabhrai lightly touching Champak's shoulder.
 "*Sat Sri Akal*," said Sher Singh.
 "Live in plenty. Live a long age," replied Sabhrai taking her son's hand and kissing it.
 "Sleep well." (Singh, 1959, p. 17)

All the words, except *Sat Sri Akal*, are familiar, and so is the context: a son declaring he is going to bed and uttering a greeting (leave-taking) such as "good night," and his mother giving an appropriate response. Other elements of the text, however, may not be as interpretable. For some readers, the mother-in-law's presence in the scene may be puzzling. Other unfamiliar features may be the command that the mother-in-law issues to the daughter-in-law to "press" the son's head. In this Indian context, *press* means 'massage' and is equivalent to the word in an Indian language, for example, *sir dabaanaa* 'to press one's head' in Hindi.

The greeting *Sat Sri Akal* identifies the family as belonging to the Sikh community, and the son's use of this phrase followed by the mother's blessing represent the traditional pattern of such exchanges in South Asia (Kachru, 1995). In traditional Indian joint families, married sons live with their parents, which explains the mother-in-law's presence. The command by the mother-in-law to her daughter-in-law is normal: Daughters-in-law are treated no differently than daughters. They are expected to obey their parents-in-law. What is essential to arrive at a rich interpretation of the text is familiarity with the institution of "family" as it functions in India, and the patterns of interaction that are attested in that context.

Literary creativity in the Outer and Expanding Circle has had a significant and lasting impact on the literary scene of World Englishes. This is confirmed by the fact that in recent years a number of the prestigious literary prizes have been awarded to writers from these circles. The list includes the Nobel Prize in Literature, awarded to Wole Soyinka (Nigeria) in 1986, Derek Walcott (Trinidad) in 1992, V. S. Naipaul (Trinidad) in 2001, J. M. Coetzee (South Africa) in 2003; the Neustadt Award to Raja Rao (India) in 1988; the Booker Prize, awarded to Naipaul in 1971, Salman Rushdie (India) in 1981, Coetzee in 1983 and 1999, Michael Ondaatje (Sri Lanka) in 1992, Ben Okri (Nigeria) in 1991, Arundhati Roy (India) in 1997, Kiran Desai (India) in 2006, Arvind Adiga (India) in 2008.

Conclusion

It is not possible to explore all facets of linguistic creativity in this short entry. For lack of space, the entry has not touched upon the domains of print, audio and video media, commerce, and pop culture (see Kachru et al., 2006, pp. 271–346). However, research in all these areas is continuing and new insights are being gained in linguistic form and language use.

Linguistic creativity in World Englishes is a fascinating topic of study as it has wider implications for investigations in human linguistic competence, sociolinguistics, and language education (see Bolton & Kachru, 2006, 2007; Kachru et al., 2006; Kachru & Smith, 2008).

Linguistic Disadvantage of Children in Legal Contexts

MICHELLE ALDRIDGE

Talking with anyone in authority is a challenging prospect for most people. This claim is true for all in the legal setting but especially so for those who, for whatever reason, are not competent in language and communication. In this entry, we review the experiences of people who are linguistically disadvantaged within the legal setting. Our focus will be on children, but much of our discussion is also relevant for people with communication disabilities and non-native speakers. We focus on witnesses and victims rather than offenders and consider how they cope in investigative interviews and cross-examination.

We investigate cases of sexual abuse for, in this crime, there is often no corroborative evidence and therefore the case will rest solely on the linguistic accounts given. Our discussion is based on those countries with common law where justice is decided by the adversarial system. Here, a verdict is given by the jury based on the account of the prosecution for the victim/witness and the defense for the accused. A guilty verdict will be given if the jury decides “beyond reasonable doubt” that the prosecution is telling the truth. The adversarial system is thus a war of words where the witness/victim’s account has to be persuasive.

Historically, children have not had a fair hearing within the criminal justice system: they were considered the “most dangerous of all witnesses” (Whipple, 1911, p. 308); sexual abuse of them was not recognized, and even in cases where it was, they were thought to be “highly suggestible, unable to differentiate fantasy from reality” and possessing what today we would call very “malleable memories” (Goodman, 1984, p. 2). The situation, however, has improved in many countries; as Bussey (2009, p. 212) noted, “the lack of regard for children’s special needs in justice systems was formally acknowledged by the Union Nation’s convention on the rights of the child (1989). This charter challenged legal systems throughout the world to focus on the rights of child witnesses without negating the rights of the accused”.

Following this charter, in many countries a great deal has been done to improve the rights of all within the criminal justice system, and special attention has been paid to vulnerable witnesses (see *Achieving Best Evidence [ABE]*, Home Office/Department of Health, 2007 for a definition and review of the system in England and Wales as an example) with the aim of giving them the opportunity for a fair hearing. There remain, of course, cultural differences: some countries in Asia and China, for example, do not recognize abuse within families; in Australia, cultural sensitivities have largely precluded investigating within the Aboriginal communities (see Eades, 2002, 2003, 2004 for more detail); and in the USA the rights of the accused remain paramount, making many changes made by common law jurisdictions harder to achieve (Bussey, 2009, p. 212).

In any legal case, and certainly within the adversarial system, justice depends on the participants being willing to give an account of events. This first hurdle is especially hard in cases of sexual abuse, where very often the perpetrator has frightened the victim into silence by warning them that something terrible will happen if they “tell anyone their secret” (Alaggia, 2005).

2 LINGUISTIC DISADVANTAGE OF CHILDREN IN LEGAL CONTEXTS

The next issue is whether the witness is able to talk about the abuse in an interview setting, and much has been written about the cognitive (in)abilities of children and the questioning style of investigative officers. With regard to the role of the witness within an investigative interview, people who are linguistically disadvantaged have been deemed, until recently, to be unreliable because

- they have a short memory,
- they lack sufficient vocabulary,
- they can't construct a full narrative account of events and therefore provide insufficient evidence,
- they are suggestible to questioning.

It is now well established, however (see Bottoms, Najdowski, & Goodman, 2009 for a review), that children as young as four possess the necessary moral and cognitive capacities to be interviewed if done so appropriately (e.g., Lyon & Saywitz, 1999; Burgwyn-Bailes, Baker-Ward, Gordon, & Ornstein, 2001). Until recently, however, interviewing techniques have not been appropriate. Many interviews, for example, have been interrogative rather than investigative in nature; the police officer has dominated the interview with complex, hostile, and leading questions; there have been long delays between the reported crime and the investigative interview; and the witness statement often was not a true reflection of what the victim said but rather was a summary reflecting the police's agenda. Clearly, changes had to be made.

Much scientific research was done in analyzing the linguistic interactions in real-life interviews and through linguistic experiments with children and mock juries to (i) evaluate the developmental perspective of the child (Cronch, Viljoen, & Hansen, 2006; Goodman & Melinder, 2007); and (ii) establish a wide range of techniques and practice in interviewing styles (see Saywitz & Camparo, 2009 for a review). A consensus was reached, and, from these recommendations, many countries now have professional interviewing guidelines and protocols. Some of the best known are:

- the cognitive interview (Geiselman, Fisher, Firstenberg, Hutton, Sullivan, & Avetissian, 1984);
- the step-wise interview (Yuille, 2002);
- ABE (Home Office/Department of Health, 2007);
- NICHD (National Institute of Child Health and Human Development) (Lamb, Orbach, Hershkowitz, Espin, & Horowitz, 2007).

While these protocols vary, they share similar recommendations, with many of them following a phased approach to the interview. We summarize here some of ABE for illustrative purposes. The guidelines within ABE recommend that the interview should take place in a nonhostile, supportive, environment (often a purpose-built interview suite). Time should be made for rapport, where the interviewer empowers the witness to gain some control of the process and content of their disclosure (Shepherd & Milne, 1999, p. 132) by asking nonthreatening neutral questions such as "I don't know you very well yet, so please tell me something about what you do after school"; and giving working guidelines such as it is all right to say "don't know" to a question and to have a break at any time. During this phase the interviewer should be listening to the witness's language skills and establishing that she understands the importance of telling the truth, because in England and Wales children do not take the oath. Care must be taken here to explain the procedure and terms to the witness. For example, a child who believes that "judges

give money away at pet shows" and that "the police put people in prison" (Aldridge, Timmins, & Wood, 1997) is not going to be willing to give an account of events.

Once rapport has been achieved, the interview will move into the free narrative phase, where the aim is to get the witness to tell her story. Initially, the "TED" questions should be asked:

Please tell me what happened? (T)

Please explain what happened? (E)

Please describe what happened? (D)

Davies and Westcott (1999) claim that this phase is crucial to the outcome of the case, since juries find free narratives persuasive because they present the child's rather than the interviewer's account and, in providing a monologue, children are free from any suggestions that adult questions may offer. The interviewer should provide a framework for the child to build his own account around with lines such as "I want you to start at the beginning, take your time and tell me what happened."

This phase, though, is not without difficulty because young children can find account giving difficult. We know, for example (Goodman & Melinder, 2007, p. 12), that "open-ended questions typically elicit the most accurate, albeit often the most skeletal, reports from children." The following is a typical account from a police (IR) interview with a child witness (IE) aged 10 years:

IR: It's ok to tell me.

IE: He said lie down for a minute and I said no and then I lied down and he got it in and he put it in here and he turned me over and licked my bum and that's all of it

An adult witness would be most unlikely to answer in this way; a lot of information is missing and the interviewer will need to ask questions to supplement the very short account given. In brief, the younger the child, the more the interviewer is likely to have to prompt. As shown below, a young child might offer a single piece of information while an older child can link events together:

Police interview with a child witness aged 5

IR: Tell me what happened?

IE: Jimmy put mummy's tights on

Police interview with a child witness aged 9

IR: Tell me what happened

IE: I was sitting on the van and what he done, he touched my bum and then after that he put his hand under my shirt, this shirt.

Problems with vocabulary occur in this phase too, simply because a young child will not have the rich vocabulary necessary to recount what has happened. Compare (a) with (b).

(a) *Police interview with a child witness aged 4*

IE: He touched my leg

IE: Phil put his fingers in my private

(b) *Police interview with a child witness aged 9*

IE: He rubbed my leg

IE: He pushed his fingers into my private parts

Bell and Loftus (1985) report (amongst others) that juries are more influenced by vivid and powerful language than by powerless language (for the concept of powerful vs. powerless language see O'Barr, 1982), so we might anticipate (b) having a greater impact on a listener than (a), even though they are describing similar events. The interviewer will therefore have to work harder to elicit accounts from younger children.

After the TED questions, the interviewer should ask *wh*-questions in the order in which they are acquired by children, namely: what, where, who, when, how. "Why" should be avoided as it tends to attribute blame. Finally, if it is the only means of eliciting missing information the interviewer can use focus questions such as "Was it a red or white car?" and yes/no questions. These questions should be delayed as long as possible as children are more likely to give inaccurate responses to them (Lamb et al., 2007). It is known, for example, that in order to please, young children will typically answer "yes" to yes/no questions and adopt a recency strategy in an option question, offering the last option heard.

Finally, the interviewer must make time for closure so that the child can ask any questions and understand what has happened and what will happen next. The child should also be thanked for his contribution.

It is now recommended that this interview be audio or video recorded. In England and Wales, the norm is for video interviewing. The video evidence will be passed to the Crown Prosecution Service and, if thought appropriate, will be shown in court as the child's evidence-in-chief (the case for the prosecution).

To achieve best practice, it is essential that interviewers receive specialized training on interviewing techniques and child development so that they avoid biasing the child's account. Regular monitoring of the interviewer's performance is also advised.

Just as there have been changes in procedure for the police interview, so there have been changes in legislation for vulnerable witnesses in court in England and Wales. More specifically, in 1999 the Youth Justice and Criminal Evidence Act was passed. Part 2 of this Act embodied the legislative provision of "Speaking Up for Justice" (1998), which included a number of special measures intended to address the problems of vulnerable and intimidated witnesses within the court process (Burton, Evans, & Sanders, 2007, p. 1). *Achieving Best Evidence* (Home Office/Department of Health, 2007) gives a definition of vulnerable and intimidated witnesses, and people who fall into these categories can apply for special measures, which include

- screening the witness from the accused,
- giving evidence by live link,
- the removal of wigs and gowns,
- giving evidence in private,
- video recording of evidence-in-chief,
- video recording of cross-examination and reexamination,
- examination through intermediary, and
- provision of aids to communicate.

Witnesses are also protected from cross-examination by the accused in person and there should be no mention of sexual history in court. Similar "special measures" are found in Australia, Canada, Hong Kong, Ireland, Israel, New Zealand, Scotland, South Africa, and the USA.

When a case goes to court, the police interview is shown in the courtroom as the witness's evidence-in-chief. Unfortunately, however, the witness still has to go to court for cross-examination, although, in many countries, this will typically happen in a link room or behind a screen. It has been suggested that this experience may, in fact, be worse for witnesses than giving their entire evidence live because under this system they "are plunged

directly into hostile cross-examination at trial without the ‘warm up’ that examination-in-chief arguably provides” (Ellison, 2001, p. 57). In court, the witness is subjected to the well-known linguistic strategies used by defense lawyers, such as coercive questioning and intimidation tactics (Conley & O’Barr, 2005) which distress the witness and potentially distort the evidence by discrediting the prosecution case and diverting the focus of the jurors away from the central issues (Ellison, 2001, p. 111).

The changes in legislation and the introduction of interviewing protocols have no doubt improved opportunities for witnesses. Many surveys in the UK (Hamlyn, Phelps, Turtel, & Sattar, 2004; Plotnikoff & Woolfson, 2004; Aldridge & Williams, 2006) report that witnesses and interviewing officers have benefited from the changes but, as with all progress, there are reported disadvantages such as the following:

- Public awareness. Officers felt that they, the lawyers, the judges, and the public needed awareness-raising exercises to understand how special measures worked and to dispel common myths and prejudices that all children and people with disabilities will be unreliable witnesses. Many felt that calling these witnesses “vulnerable” added to the stereotype of limitations rather than empowering them.
- Impact. Some officers expressed doubts that giving evidence via video or link room was as effective as giving live evidence in the courtroom (Cashmore & Trimboli, 2005; Aldridge & Williams, 2006), though some research in England and Wales and in Australia does not support this concern (Taylor & Joudo, 2005). For this reason, however, child witnesses in America still present live for cross-examination.
- Changing laws does not guarantee their effective implementation. Some officers fear that the quality of video evidence is poor and many cases are being thrown out because of sound quality issues rather than the witness’s account.

The overriding problem still seems to be the nature of the adversarial system itself. A quote from one of our officers (Aldridge & Williams, 2006) summarizes the current position:

The criminal justice system struggles to provide an adequate stage on which vulnerable witnesses can perform. The court doesn’t accept [that] the young child or the disabled witness can be reliable. Special measures do not provide an equal footing for such witnesses. The burden of proof is beyond most witnesses.

As Ellison (2001, p. 12) notes, “there is a clear and seemingly irreconcilable conflict between the needs and interests of vulnerable witnesses and the basic assumptions and resultant evidentiary safeguards of the adversarial trial process.” Similarly, Aldridge and Luchjenbroers (2008) report that there remains a problem with the dual function of the video interview since it has both to gather evidence for use in criminal proceedings and to act as the prosecution case. These tasks may be incompatible. Combining this with the fact that cross-examination still goes on linguistically unchecked, we wonder whether tinkering with the system can ever work. It seems that the adversarial system cannot easily offer justice for people who are linguistically disadvantaged and that research should turn to examining whether the inquisitorial style of criminal proceedings holds inherent advantages for such populations.

Linguistic Diversity

LENORE A. GRENOBLE

Although it is somewhat difficult to count languages and to measure linguistic diversity with exact precision, there are estimated to be between 6,000 and 7,000 languages spoken in the world today. Languages can be classified genetically or typologically. Genetic classification involves the relationships of languages from a common ancestor, how they are related in terms of linguistic families. Typological classification involves how languages are more or less similar in terms of type of linguistic structures. Finally, diversity can also be found within a single language, with differences due to geography or social factors. Even monolingual speech communities are not homogeneous; speakers exhibit differences according to region, age, gender, level of education, and socioeconomic status. Yet the majority of people in the world are bilingual or multilingual, a critical factor to be taken into account in formulating educational and linguistic policies in many parts of the world. Linguistic diversity is an important factor in language planning and policy making, and in educational methods and policies. At present one of the major concerns for many linguists and speakers alike is language endangerment and the potential loss of much of the world's linguistic diversity. Thus language diversity is an issue of utmost importance in applied linguistics.

Genetic Groupings and Diversity

Genetic linguistics classifies languages which can be traced to a common ancestor in terms of family trees. Genetic groupings can be made at many different levels, with smaller groupings of just two or three languages whereas the largest grouping, a language stock, consists of many languages. These languages are typically arranged on a language tree, with more closely related languages grouped together on a single branch; branches are then grouped together on nodes, where a node again represents a common ancestor. The Indo-European family is the most studied. There are no records of the earliest form of the ancestral language, proto-Indo-European, but it has been reconstructed through the comparative method.

In order to establish a genetic relationship between two or more languages, a large number of similarities must be established at different linguistic levels (phonological, morphological, and syntactic). It is important to have sufficient data to rule out similarities from parallel but separate changes, those due to contact and borrowing (such as loanwords but other kinds of contact-induced change as well), and others due to typological similarities. There have been attempts to group language families into larger groupings, sometimes in search of a common ancestor for all human languages. Such groupings are highly controversial because they are reconstructions based on reconstructions, not attested languages, and need to be approached with serious skepticism.

Typological Diversity

Languages can also be classified in terms of type, or structure. This system ignores genetic relatedness and instead looks for correlations between structures. A very common system

DOI: 10.1002/9781405198431.wbeal0716

is word order classification, grouping languages together on the basis of the order of the basic constituents of subject (S), object (O) and verb (V). English is an SVO language and Turkic SOV. Certain other characteristics correlate with basic word order. For example, SVO languages have a strong tendency to use prepositions, while SOV languages use postpositions. As this characterization suggests, typology is concerned not only with finding which structures are useful for classification but also how they correlate with one another. Part of this involves the search for linguistic universals—absolute universals are true of all languages, while those that are widespread but not absolute are considered to be tendencies, not universals.

Typology classifies languages according to a variety of structure—phonological, morphological or syntactic—and therefore it is impossible to determine just how many different types of languages there are. That said, some structures or patterns provide more insight into human language than others. For example, it is not particularly useful to classify languages with the vowel /o/, as a great many languages have it, but it can be useful to classify languages in terms of the number of vowel (or consonant) phonemes. The *World Atlas of Linguistic Structures*, or WALS, (Haspelmath, Dryer, Gil, & Comrie, 2005), is one attempt to map a multitude of different structural variables geographically to uncover what, if any, patterns exist through space. The sampling in WALS shows that the most common vowel inventory is five vowels; only four languages have inventories with only two vowel phonemes, and only one (German) hits the high end of 14 vowel phonemes (Maddieson, 2005, p. 14). Within the category of word order types, SOV is somewhat more common than SVO. But if one looks at the position of just the subject relative to the verb, the subject precedes the verb in a much larger percentage of known languages. Moreover, languages in which the object is the first element are very uncommon, both OVS and even more so OSV are quite rare (Dryer, 2005, pp. 330–5).

Structural diversity is extremely difficult to calculate. In contrast to genetic diversity, where languages can be grouped into stocks and compared, there is no comparable measure for structural diversity. Moreover, structural diversity in fact refers to a range of different features which are independent of one another. Languages can be similar according to one parameter (such as phonology) and very different according to another parameter (e.g., morphological marking). Work in linguistic typology is advancing in terms of determining what, if any, correlations exist between these different variables, and the extent to which they pattern with genetic relations emerges. One classic system is according to morphological type. There are four basic categories: *fusional*, *agglutinating*, *isolating* (or *analytic*), and *polysynthetic*. In isolating languages (like Chinese), there is a strong to absolute correlation between the word and a grammatical morpheme. In agglutinating languages (e.g., Turkish), morphemes tend to have a single, identifiable function. Such morphemes are typically suffixes added to a lexical base and can be readily segmented. Fusional languages (such as Latin) combine more than one function in a morpheme, such that the marking of plural and case are found in a single morpheme. In agglutinating languages, in contrast, these would be encoded in two separate morphemes. Polysynthetic languages are less common than the other three types and are characterized by words with a large number of morphemes, lexical and inflectional; the long strings of morphemes often better correspond to sentences than words in other types of languages.

Sociolinguistic Typology

Both typological and genetic classification systems look at linguistic diversity across individual languages and see how they compare to one another. But languages also exhibit diversity, or variation, across dialects and sociolects. Such differences are generally treated

under the rubric of dialect diversity, although they extend beyond regional variation. Dialect diversity and sociolinguistic variation consider how language differs and changes in speech communities with particular emphasis on the interaction of social factors (such as gender, ethnicity, age, and so on) and linguistic structures. Foundational work in sociolinguistic typology argues that the distribution of linguistic features over language is not random or areal but to a certain extent predictable, based on the hypothesis that there is a correlation between social structure and linguistic structure (see Trudgill, 2009, for an overview). There are also differences according to the speech situation itself: language varies across different genres and registers. The teaching of dialect awareness and sensitivity to dialect diversity has attracted greater attention as linguists make the case for the importance of such information in teaching literacy skills and basic education (see Wolfram & Schilling-Estes, 2006, pp. 329–60).

Measuring Language Diversity

Given the vast number of different languages in the world, we can ask how they are geographically situated and whether certain areas of the world show greater language density (and thus diversity) than others. Taking Lewis (2009) as a starting point for identifying languages and numbers of speakers, we see that there is great variation in language density. Papua New Guinea, with only approximately 0.6% of the world's speakers and 0.4% of the world's land, is home to 830 languages, or 13–14% of all languages. In contrast, Haiti has only two languages with a total population of 6,960,000 speakers, so linguistic diversity is very low.

One well-known measure is Greenberg's (1956) diversity index—the probability that any two random members of a given population speak the same language. By this measure, the diversity index for Papua New Guinea is 0.99, the highest in the world, and Haiti is very low, 0.03 (Lewis, 2009). Greenberg himself is quick to point out that this measure fails to take into account the diversity of the languages themselves in a given region. Most would agree that a region where a large number of closely related languages are spoken is somehow less diverse than a region where a smaller number of unrelated languages are spoken.

In order to determine just how much genetic diversity there is, it is important to compare the same levels of trees with one another. The most clearly established comparison is found in Nichols (1992). Nichols examines linguistic diversity at the level of a language stock. She makes a rigorous distinction between these two classifications, family and stock, which in turn enables her to compare similar levels of genetic classification to assess linguistic diversity. A language stock is a group of languages which can be traced to a common ancestor. Using this methodology, one arrives at a figure of 250 different language stocks; their geographic distribution can be computed to provide a picture of language density by determining the number of language stocks per square mile, dividing the world into 10 continental and subcontinental regions (Nichols, 1992, p. 233). Nettle (1999, p. 117) augments this by adding the number of families per stock. They do not pattern exactly, since some stocks have more languages than others. Thus, for example, New Guinea has a language density of 1,197.6/km² with 27 stocks and a genetic density of 227.3; Oceania is second highest with a language density of 322.1/km² but has only 4 stocks. North America is on the low end with a language density of 12.3/km² but 50 stocks.

One clear pattern emerges from these calculations. Genetic density is low for the "Old World" regions (Africa, northern Eurasia, South and Southeast Asia) and higher for the colonized regions of the world, or the "New World" (the Americas, New Guinea, and Australia). Language density can also be correlated with relation to the equator: language

4 LINGUISTIC DIVERSITY

diversity is greatest along the equator and thins out further away. In addition, there are two belts of great linguistic diversity in the Old World. One of these extends from the Ivory Coast along West Africa and into Zaire, while the other stretches from southern India through the Indonesian islands, New Guinea, and into the Western Pacific (Nettle, 1999, p. 61).

The picture is further complicated if we calculate not only genetic relatedness but add the factor of structural diversity, although this is challenging because such diversity can be assessed along so many different parameters. Yet another measure would be to take into account the number of indigenous versus immigrant languages. Two linguistic families dominate in terms of number of speakers worldwide and in terms of geographic range. The Sino-Tibetan family has the most speakers as Mandarin (Chinese) is by far the most widely spoken first language. The Indo-European language family, due to a history of geographic spread, colonization and conquests, is spread throughout the globe.

Linguistic Human Rights

TOVE SKUTNABB-KANGAS

Introduction: What Are Linguistic Human Rights?

If the search engine Google had existed some 30 years ago, searching on the term “linguistic human rights” (in English) would probably have given maximally a dozen hits or so, if any. Today (October 2011), there were around 9,260,000 hits. Even Google Scholar returns 579,000 entries. It seems that the concept resounds with many people. Language endangerment, maintenance, and revitalization and general protection of both users of various languages and the languages themselves are central topics, with both Indigenous peoples and various minorities (urban, rural, national, immigrant, refugee, asylum-seekers, etc). Linguistic human rights (LHRs) in education combine many of the interests in this multi- and transdisciplinary area.

Linguistic rights or *language* rights (LRs), terms often used as synonyms, are all rights related to the learning and use of languages. Some researchers regard linguistic rights as a somewhat broader concept than language rights. In this case they are often discussing rights not only to various languages but also to varieties *within* the “language” label, for example regional, gender-based, or class-based varieties. LRs have been discussed for centuries, and the first multilateral treaties about LRs date from the 1880s (see Capotorti, 1979; Skutnabb-Kangas & Phillipson, 1994a; de Varennes, 1996; Thornberry, 1997; Skutnabb-Kangas, 2000; and May, 2001 for overviews). Our present human rights (HRs) date from the period after World War II, but there were many HRs treaties already under the League of Nations after World War I.

But only those language-related rights are linguistic *human* rights (LHRs) that are so basic that every human being is entitled to them because of being human. They are as necessary to satisfying people’s basic needs as food and shelter are; they are necessary to live a dignified life. They are so fundamental that no state (or individual or group) is supposed to violate them. LHRs combine some LRs with human rights. The first full book about LHRs was published in the mid-1990s (Skutnabb-Kangas & Phillipson, 1994b), and the scope of LHRs is still discussed. There are many LRs that are not LHRs. It would, for instance, be nice if everybody could, even in civil court cases, have a judge and witnesses who speak (or sign) this person’s language, regardless of how few users the language has. Today, it is in criminal cases only that one has any LHRs (see below). In all other court contexts, people may or may not have a *language* right.

Negative and Positive Rights

Some basic rights prohibit discrimination on the basis of language (negative rights); others ensure equal treatment to languages, individuals, or language groups (positive rights). Most LHRs are negative rights. Negative rights have been defined by Max van der Stoep (1999, p. 8) as “the right to non-discrimination in the enjoyment of human rights,” whereas positive rights have to do with “the right to the maintenance and development of identity through the freedom to practise or use those special and unique aspects of their minority life—typically culture, religion, and language.” Negative rights must

2 LINGUISTIC HUMAN RIGHTS

ensure that minorities receive all of the other protections without regard to their ethnic, national, or religious status; they thus enjoy a number of linguistic rights that all persons in the state enjoy, such as freedom of expression and the right in criminal proceedings to be informed of the charge against them in a language they understand (i.e. not necessarily the mother tongue), if necessary through an interpreter provided free of charge. (van der Stoel, 1999, p. 8)

Positive rights are those

encompassing affirmative obligations beyond non-discrimination . . . [They] include a number of rights pertinent to minorities simply by virtue of their minority status, such as the right to use their language. This pillar is necessary because a pure non-discrimination norm could have the effect of forcing people belonging to minorities to adhere to a majority language, effectively denying them their rights to identity. (van der Stoel, 1999, p. 8)

Negative rights (instrumental rights) are not sufficient for an Indigenous people or a minority to reproduce themselves as a people or minority and they may lead to forced assimilation. In some interpretations, only positive rights (which can also be called affective rights) are LHRs proper.

Who or What Can Have LRs? Languages, Individuals, and Collectivities

Languages themselves may have rights to be used, developed, and maintained. The Council of Europe's *European Charter for Regional or Minority Languages* grants rights to languages, not speakers of the languages concerned: they are LRs, not LHRs. The basic human rights instruments can be found at the Web site of the Office of the United Nations High Commissioner for Human Rights (<http://www2.ohchr.org/english/law/>).

Many HRs instruments, especially those that were the first to emerge after World War II, are concerned with rights of *individuals* (e.g., the United Nations' *Universal Declaration of Human Rights*, or the UN *Convention on the Rights of the Child* (CRC) of 1989, <http://www2.ohchr.org/english/law/crc.htm>). Some of these are LRs, some may be LHRs. An *individual* from a certain group or with specific characteristics in a specific country may, for instance, have the right to use her or his *mother tongue* in various contexts (e.g., in dealing with the authorities, local, regional or state-wide), orally or signing it, in writing, or all of these. However, the authorities do not necessarily need to reply in the same language.

The *mother tongue* is often for legal purposes defined in a strict way, as the first language that a person learned, and still speaks, and with which she identifies. In most cases both a degree of competence and use of the language is demanded, together with identification; in some (few) cases identification with the language is enough. If those Indigenous peoples whose parents or grandparents were forcibly assimilated are to have a chance to reclaim or revitalize their languages, a definition based on identification only, with no demands of competence or use, is necessary. Educational LHRs, especially the right to mother-tongue-based multilingual education, are among the most important LHRs (see Skutnabb-Kangas, 2000; Skutnabb-Kangas, Phillipson, Mohanty, & Panda, 2009; Heugh & Skutnabb-Kangas, 2010).

Individuals may also have rights in relation to *languages other* than their mother tongue/ first language. Mostly these rights relate to a dominant, official, or national language in the country. Some people have also started to demand that access to an international language, in most cases English, should be seen as a language right.

Alternatively, *collectivities* of people (individuals, groups, peoples, organizations, or states) may have rights to use, develop, and maintain languages or duties to enable the use, development, or maintenance of them. The Council of Europe's *Framework Convention for the Protection of National Minorities* grants rights to (national) minorities (i.e., groups). Once a state has both signed (promised to start the process which enables ratification) and ratified one of these human rights instruments (changed their laws and regulations and put processes in place that enable them to fulfill the obligations that they have promised to undertake), these are binding for the state. States usually have a duty to report at specified intervals how they have acted to guarantee the rights, and there is also normally some kind of monitoring body that scrutinizes the reports and gives feedback and guidance to the states. The human rights regime of the League of Nations between the two "World" Wars contained many *collective* rights; in principle most minority rights should be collective rights (see Thornberry & Gibbons, 1997). In the United Nations regime after 1945, it was claimed that no collective rights were necessary since every person was protected as an individual, by individual rights. Collectivities like "minorities" were seen by many negotiators (e.g., the US human rights negotiator Eleanor Roosevelt) as "a European problem," in other words, not universal. The Council of Europe's 1950 *Convention for the Protection of Human Rights and Fundamental Freedoms* (see <http://conventions.coe.int/treaty/EN/Treaties/html/005.htm>) and the corresponding African and American instruments (the *African Charter on Human and Peoples' Rights* of 1981, see www.achpr.org, and the *American Convention on Human Rights* of 1969, see www.wcl.american.edu/pub/humright/digest/index.html) are regional rights. Universal collective rights reemerged later and few of these are language-related. Some new universal instruments include language-related rights, though, such as the *United Nations Declaration on the Rights of Indigenous Peoples* (UNDRIP, 61/295, 2007, see <http://www.un.org/esa/socdev/unpfii/en/drip.html>) and the *UN Convention on the Rights of Persons with Disabilities* (2007, see <http://www.un.org/disabilities/convention/conventionfull.shtml>). Language is mentioned in many articles in the latter; this is especially important for the Deaf. In the former, Articles 13 and 14 have several LHR-related formulations—but since it is "only" a Declaration, it is not legally binding on states:

Article 13

1. Indigenous peoples have the right to revitalize, use, develop and transmit to future generations their histories, languages, oral traditions, philosophies, writing systems and literatures, and to designate and retain their own names for communities, places and persons.
2. States shall take effective measures to ensure that this right is protected and also to ensure that indigenous peoples can understand and be understood in political, legal and administrative proceedings, where necessary through the provision of interpretation or by other appropriate means.

Article 14

1. Indigenous peoples have the right to establish and control their educational systems and institutions providing education in their own languages, in a manner appropriate to their cultural methods of teaching and learning.

Some important language-related instruments try to combine individual and collective rights, by using "persons belonging to a minority" or a similar phrase. This is what, for instance, Article 27 of the UN *International Covenant on Civil and Political Rights* (ICCPR, see <http://www2.ohchr.org/english/law/ccpr.htm>) uses. Article 27 is still the most far-reaching article in (binding) human rights law granting linguistic rights:

4 LINGUISTIC HUMAN RIGHTS

In those states in which ethnic, religious or linguistic minorities exist, persons belonging to such minorities shall not be denied the right, in community with other members of their group, to enjoy their own culture, to profess and practise their own religion, or to use their own language.

Article 30 in the *CRC* (see above) is almost the same except that it has added “or is indigenous,” and it uses “he or she”—Indigenous people and females have become subjects in international law.

Many international organizations and most states have a language policy which spells out the official languages of the organization or state and, by implication, the LRs of the people, groups, and states dealing with, and working within, that entity. The United Nations have six official languages, the Council of Europe only two. The European Union has several times increased the number of its official languages, such that after its latest expansion the Union now (2011) has 25 official languages; all official documents have to be made available in all of these. Many organizations also have working languages; their number may be more restricted. A number of states have only one official (or state) language; most have two or more.

In addition, many states specify one or several national, additional, link, or national heritage languages in their constitutions; in most cases, speakers of these have fewer rights than speakers of the official languages have (see de Varennes, 1996). Most states have spelled out some kind of minority protection for linguistic minorities, either with only negative or with both negative and positive rights. Some countries which do have linguistic minorities deny this fact (e.g., Turkey), therefore the definition of a minority is important. There is no legal definition in international law of what a minority is, even if the issue has been discussed extensively (e.g., Capotorti, 1979; Andrysek, 1989). Most definitions are fairly similar, though, and resemble the definition below (from Skutnabb-Kangas & Phillipson, 1994a, p. 107, note 2):

A group which is smaller in number than the rest of the population of a State, whose members have ethnic, religious or linguistic features different from those of the rest of the population, and are guided, if only implicitly, by the will to safeguard their culture, traditions, religion or language.

Any group coming within the terms of this definition shall be treated as an ethnic, religious or linguistic minority.

To belong to a minority shall be a matter of individual choice.

If a group claims that they are a national minority and individuals claim that they belong to this national minority, the state may claim that such a national linguistic minority does not exist, resulting in a conflict. The state may refuse to grant the minority person or group rights which it has accorded or might accord to national minorities. In many definitions of minority, minority rights thus become conditional on the acceptance by the state of the existence of a minority in the first place. According to my definition of a minority (see above), minority status does *not* depend on the acceptance of the state, but is either “objectively” (“coming within the terms of this definition”) or subjectively (“a matter of individual choice”) verifiable, or both. This interpretation was confirmed by the UN Human Rights Committee in 1994. They reinterpreted Article 27 above in General Comment No. 23 of April 6, 1994 (UN Doc. CCPR/C/21/Rev.1/Add.5, see <http://www.unhchr.ch/tbs/doc.nsf/0/fb7fb12c2fb8bb21c12563ed004df111?Opendocument>). The UN Human Rights Committee saw the Article as (a) protecting all individuals on the state’s territory or under its jurisdiction (i.e., also immigrants and refugees), irrespective of whether they belong to the minorities specified in the Article or not; (b) stating that the existence of a minority

does not depend on a decision by the state but requires to be established by objective criteria; (c) recognizing the existence of a “right”; and (d) imposing positive obligations on the states.

For Deaf people this means that various countries minimally have to see the Deaf as a (linguistic) minority, protected by Article 27. Likewise, the reinterpretation means that minorities, including the Deaf, are supposed to have positive language rights, not only the negative right of protection against discrimination.

Numbers also matter. A group has to have a certain size in order to have language-related rights. It often depends on how many individuals there are in the unit under consideration (country, area, region, municipality, etc.) whether individuals (speakers or signers) belonging to that group have any LRs, let alone LHRs. Two of the most important European LRs documents use group size as a criterion, but do not in any way define it. The *European Charter* and the *Framework Convention* (see above) use formulations such as “in substantial numbers,” or “pupils who so wish in a number considered sufficient,” or “if the number of users of a regional or minority language justifies it.” It is obviously necessary to limit the size to adjust to various contexts and also for economic reasons, but it is also possible for reluctant states to use lack of what they claim are “sufficient” numbers as a legitimization for lack of political will.

Linguistic Genocide and Educational LHRs

Many political scientists seem to think that only (large) national minorities should have their languages promoted by the state (i.e., have positive rights), whereas small national minorities, small Indigenous peoples, and, especially, immigrant minorities, cannot expect more than toleration-oriented negative rights. On the other hand, toleration and non-discrimination, understood in liberal terms (a state should not interfere on behalf of a group’s special characteristics, such as religion), does not work in relation to language. A state has to choose *some* language(s) as the language(s) of administration, courts, education, possibly the media, and so on, and this necessarily privileges some language(s) (see Rubio-Marín, 2003).

For proper integration of linguistic minorities and Indigenous peoples, positive *promotion-oriented rights* are thus necessary. Negative toleration-oriented rights are not sufficient and often lead to forced assimilation or even linguistic genocide, according to two of the definitions of genocide in UN *International Convention on the Prevention and Punishment of the Crime of Genocide* (E793, 1948; 78 U.N.T.S. 277, entered into force January 12, 1951; for the full text, see <http://www1.umn.edu/humanrts/instreet/x1cprpgc.htm>). The *Convention* has five definitions of genocide. Three of them are about physical or biological killing, but the remaining two fit most of today’s (and earlier) Indigenous and minority education:

Article II(e): “forcibly transferring children of the group to another group,” and Article II(b): “causing serious bodily *or mental* harm to members of the group” (emphasis added).

Most speakers of numerically large languages in countries that have not been colonized are probably not even aware of the privilege that they are enjoying, when they can have their education through the medium of a language that they know and understand, and teachers with whom both they and their parents can communicate easily. But for almost all the world’s Indigenous and tribal peoples and many if not most minorities (ITMs), and for most children in former colonies in Africa and Asia (regardless of their minority

or majority status), this is a dream that they have been and are still fighting for. ITMs are mostly forced to accept education (if they can attend school at all) in an alien dominant language. Their access to education is denied because of the wrong medium of education (see Tomaševski, 2003; Magga, Nicolaisen, Trask, Dunbar, & Skutnabb-Kangas, 2005; Skutnabb-Kangas & Dunbar, 2010). The controversy about the medium of education is, interestingly, not anymore about the research evidence. It is fair to say that all solid research evidence shows that

- teaching ITM children through the medium of an alien dominant language can and in many cases does lead to negative results in terms of linguistic and cognitive competence, school achievement, self-confidence and identity development, and, later, access to the labor market (see, e.g., Skutnabb-Kangas, 2000; Panda & Mohanty, 2009; Skutnabb-Kangas & Dunbar, 2010); and
- teaching ITM children mainly through the medium of their mother tongues minimally for 6–8 years, preferably longer, with good teaching of a dominant language as a second or foreign language, and possibly having one or several other foreign, often “international” languages, as subjects, can lead to high levels of bi/multilingualism and positive results in terms of the issues mentioned above (see, e.g., Cummins, 1989, 2000; Thomas & Collier, 2002; articles in Heugh & Skutnabb-Kangas, 2010). The increasingly fewer counterarguments are political and not research-based.

According to Nobel Prize laureate Amartya Sen (e.g., Sen, 1985), poverty is not only about economic conditions and growth; expansion of human capabilities is a more basic locus of poverty and more basic objective of development. Dominant-language-medium education for Indigenous children often curtails the development of the children’s capabilities (Misra & Mohanty, 2000; Mohanty, 2000). Thus it perpetuates poverty, may cause serious mental harm, and transfers children to another linguistic group through enforced language shift (see Magga et al., 2005; Skutnabb-Kangas & Dunbar, 2010, for references and arguments). Indigenous and minority students (and their parents and communities) need LHRs as one of the necessary (but not sufficient) measures to stop linguistic genocide. And for LHRs, both individual and collective positive promotion-oriented (i.e., not negative and toleration-oriented) rights are necessary. One or the other type alone is not sufficient. It is not a question of either/or, but both/and/and. The debates about the scope of LHRs continue.

Linguistic Imperialism

ROBERT PHILLIPSON

The study of linguistic imperialism focuses on how and why certain languages dominate internationally, and attempts to account for such dominance in a theoretically informed way. Many issues can be clarified: the role of language policy in empires (British, French, Japanese, etc.); how languages from Europe were established on other continents, generally at the expense of local languages; whether the languages that colonialism took to Africa and Asia now form a useful bond with the international community, and are necessary for national unity internally, or are a bridgehead for Western interests, permitting the continuation of marginalization and exploitation. In a globalizing world, has English shifted from serving Anglo-American interests into a more equitable instrument of communication for diverse users? Or do US corporate and military dominance worldwide and the neo-liberal economy constitute a new form of empire that consolidates a single imperial language? Can the active suppression of languages such as Kurdish in Turkey or of Tibetan and Uyghur in China be seen as linguistic imperialism? With the increasing importance of China globally, will the vigorous promotion of Chinese internationally convert into a novel form of linguistic imperialism?

The evidence for or against linguistic imperialism can be investigated empirically in a given context. Linguistic imperialism entails the following (Phillipson, 1992, 2009):

- Linguistic imperialism interlocks with a *structure of imperialism* in culture, education, the media, communication, the economy, politics, and military activities.
- In essence it is about *exploitation*, injustice, inequality, and hierarchy that privileges those able to use the dominant language.
- It is *structural*: More material resources and infrastructure are accorded to the dominant language than to others.
- It is *ideological*: Beliefs, attitudes, and imagery glorify the dominant language, stigmatize others, and rationalize the linguistic hierarchy.
- The dominance is *hegemonic*: It is internalized and naturalized as being “normal.”
- This entails *unequal rights* for speakers of different languages.
- Language use is often *subtractive*, proficiency in the imperial language and in learning it in education involving its consolidation at the expense of other languages.
- It is a form of *linguicism*, a favoring of one language over others in ways that parallel societal structuring through racism, sexism, and class: Linguicism serves to privilege users of the standard forms of the dominant language, which represent convertible linguistic capital.
- Linguistic imperialism is invariably *contested and resisted*.

The term imperialism derives from the Latin *imperium*, covering military and political control by a dominant power over subordinated peoples and territories. A panoramic history of language empires reveals great variety in the role of languages (Ostler, 2005). In the period of global European dominance, a combination of military, commercial, and Christian missionary activities facilitated the transplantation of Western cultural and educational norms and languages (Fanon, 1952, Mühlhäusler, 1996, Rassool, 2007). Using

2 LINGUISTIC IMPERIALISM

terms like imperialism is contentious, because “Defining something as imperial or colonial today almost always implies hostility to it, viewing it as inherently immoral or illegitimate” (Howe, 2002, p. 9), although the dominant tend to have no illusions about the workings of empire. In the Roman empire that covered much of Europe and North Africa, the strategy for co-opting a conquered people was insightfully analyzed by Tacitus 2000 years ago:

in place of distaste for the Latin language came a passion to command it. In the same way, our national dress came into favour and the toga was everywhere to be seen. And so the Britons were gradually led on to the amenities that make vice agreeable—arcades, baths and sumptuous banquets. They spoke of such novelties as “civilization” when really they were only a feature of enslavement. (Tacitus, trans. 1948, p. 72)

The significance of language for the colonial adventure was appreciated from its inception. In 1492 Queen Isabella of Spain was presented with a plan for establishing Castilian “as a tool for conquest abroad and a weapon to suppress untutored speech at home”: for its author, Antonio de Nebrija, “Language has always been the consort of empire, and forever shall remain its mate” (Illich, 1981, pp. 34–5). The language was to be fashioned as a standard in the domestic education system, as a means of social control, and harnessed to the colonial mission elsewhere.

When French became a lingua franca for secular purposes in Europe, there was widespread belief in the intrinsic superiority of the language. The Academy of Berlin held a competition in 1782 on the theme of why French was a “universal language.” A winning essay argued that languages which do not follow the syntax of French are illogical and inadequate. Maintenance of a linguistic hierarchy typically involves a pattern of *stigmatization* of dominated languages (mere “dialects,” “vernaculars”), *glorification* of the dominant language (its superior clarity, richer vocabulary), and *rationalization* of the relationship between the languages, always to the benefit of the dominant one (access to the superior culture and “progress”). The ancient Greeks stigmatized non-Greek speakers as *barbarian*, meaning speakers of a nonlanguage. The term *Welsh* was used by speakers of English to refer to people who call themselves *Cymry*. “Welsh” in Old English means foreigners or strangers, a stigmatizing categorization from the perspective of the dominant group and in their language. A dominant language is projected as the language of God (Sanskrit, Arabic in the Islamic world, Dutch in South Africa); the language of reason, logic, and human rights (French both before and after the French Revolution); the language of the superior ethnonational group (German in Nazi ideology); the language of progress, modernity, and national unity (English in much postcolonial discourse). Other languages are explicitly or implicitly deprived of such functions and qualities.

Colonial governments implemented linguistic policies that discriminated in favor of European languages. Linguistic hierarchization figured prominently, alongside racism, in the legitimation of the colonial venture (Pennycook, 1998), as it does in arguments that celebrate the current dominance of English globally (Phillipson, 2009). An analysis of the links between linguistics and the furtherance of the French colonial cause documents how French “consumed” other languages by processes of linguistic cannibalism, *glottophagie* (Calvet, 1974). Linguistic genocide, as defined in work on the United Nations genocide convention, is in fact still practiced widely in the modern world when groups are forcibly assimilated to the dominant culture and its language (Skutnabb-Kangas, 2000); such policies can also be seen as a crime against humanity (Skutnabb-Kangas & Dunbar, 2010).

Expansion Through Linguistic Imperialism

The expansion of English from its territorial base in England began with its imposition throughout the British Isles. The 1536 Act of Union with Wales entailed subordination to the “rights, laws, customs and speech of England” (cited in Jenkins, 2007, p. 132). Throughout the British Isles a monolingual ideology was propagated, with devastating effects, even if some Celtic languages have survived and are currently being revitalized. A monolingual ideology was exported to settler colonies in North America and Australasia. President Theodore Roosevelt wrote in 1919: “We have room for but one language here, and that is the English language.” More differentiated policies were needed in exploitation colonies (where the climate precluded settlement by Europeans) such as the Indian subcontinent and most African colonies (Rassool, 2007).

The present-day strength of English, French, Spanish, and Portuguese in the Americas, in Africa, in Asia, Australasia, and the Pacific is a direct consequence of successive waves of colonization and of the outcome of military conflict between rival European powers. Between 1815 and 1914 over 21 million British and Irish people emigrated, the greatest number to the USA, and increasing numbers to Canada, Australia, New Zealand, and to a lesser extent South Africa. This demographic movement, also undertaken by the Dutch, French, Portuguese, and Spaniards, assumed a right to occupy territory as though it was unoccupied: the myth of *terra nullius* which assumed that aboriginals had no right of ownership of the land. The aim was to establish replicas of the “home country” in New Amsterdam (later New York), New England, New Zealand, Nova Scotia, Hispania, and so forth.

Native American languages were initially used in missionary work and education, but when competition for territory and resources intensified, conflict between the settlers and indigenous peoples increased. Education was then established on the principle “that the only prospect of success was in taking the children in boarding schools, and making them ‘English in language, civilized in manners, Christian in religion’” (Spring, 1996, p. 152). As a direct result of such policies, very few of the languages originally present in the USA, Canada, and Australia have survived. This exemplifies linguistic imperialism vis-à-vis minority languages within a polity. It is comparable to the way the languages of the peoples of the Soviet Union were treated by Stalin: “bilingual education” meant transition to monolingualism in Russian. “Under the pressure of the imperial ideology they were forced to sacrifice linguistic rights for an ideal that was clearly an attempt at linguistic genocide” (Rannut, 1994, p. 179).

Education in US colonies functioned along similar lines. In the Philippines, there was an insistence on an exclusive use of English in education from 1898 to 1940:

public education, specifically language and literature education during the American colonial period, was designed to directly support American colonialism. The combined power of the canon, curriculum, and pedagogy constituted the ideological strategies resulting in rationalizing, naturalizing, and legitimizing myths about colonial relationships and realities. (Martin, 2002, p. 210)

Despite differences in the articulation of policies in the French and British empires, what they had in common was the low status accorded to dominated languages, whether these were ignored or used in the early years of education; a very small proportion of the population in formal education, especially after the lower grades; local traditions and educational practice being ignored; unsuitable education being provided; an explicit policy of “civilizing the natives,” and the master language being attributed civilizing properties (Phillipson, 1992, pp. 127–8). These generalizations are valid, even if policies were in fact

4 LINGUISTIC IMPERIALISM

worked out *ad hoc* in a wide variety of situations. In French colonies, the goal of producing a black elite entailed using the educational content and methods of metropolitan France. In the British empire, “English was the official vehicle and the magic formula to colonial élitedom” (Ngũgĩ, 1985, p. 115).

The World Bank has played a decisive role in funding education in “developing” countries. Its policies have continued the linguistic imperialism of the colonial and early postcolonial periods:

The World Bank’s real position . . . encourages the consolidation of the imperial languages in Africa. . . the World Bank does not seem to regard the linguistic Africanisation of the whole of primary education as an effort that is worth its consideration. Its publication on strategies for stabilising and revitalising universities, for example makes absolutely no mention of the place of language at this tertiary level of African education. (Mazrui, 1997, p. 39)

Fishman, Conrad, and Rubal-Lopez’s *Post-Imperial English* (1996) has a wealth of empirical description of the functions of English in many contexts. The 29 contributors to the volume were specifically asked to assess whether linguistic imperialism was in force in the country studies they were responsible for. They all address the issue, one editor challenges the validity of the concept, but no contributors assess whether there might be more powerful or precise ways of coming to grips with theorizing the dominance of English. In his introduction, Fishman speculates on English being

reconceptualised, from being an imperialist tool to being a multinational tool . . . English may need to be re-examined precisely from the point of view of being post-imperial (. . . in the sense of not directly serving purely Anglo-American territorial, economic, or cultural expansion) without being post-capitalist in any way. (Fishman et al., 1996, p. 8)

Corporate activities and regional economic blocs have made the locus of power more diffuse than in earlier, nation-state imperialism.

Scholars who are skeptical about linguistic imperialism as an explanatory model for the way English has been consolidated worldwide tend to analyze matters as though there is a strict choice between (a) active US–UK promotion of English, supported by linguistic policies that favor it over other languages, and (b) colonized people and others actively wishing to learn English because of the economic, social, political, and cultural doors that it opens. Matters are summed up as though (a) involves imposition, whereas (b) is a “free” choice (e.g., Kirkpatrick, 2007, pp. 35–7). This is a false dichotomy: The two elements do not exclude each other, and neither imposition nor freedom is context-free. Push and pull factors both contribute to linguistic hegemony and hierarchy.

Kirkpatrick (2007) also accepts Fishman’s conclusion (1996, p. 640) that the strength of English in former British and American colonies is more due to such countries’ engagement in the modern world economy rather than “to any efforts derived from their colonial masters.” This analysis seems to ignore the fact that this engagement presupposes a Western-dominated globalization agenda set by the transnational corporations and the IMF, and the US military intervening whenever “vital interests” are at risk. The financial and economic crises of 2008 exposed instability and the increased influence of China and other expanding economies, but hitherto English has served to consolidate the interests of the powerful globally and locally and to maintain an exploitative world order that can disenfranchise speakers of other languages.

The strong position of English in former colonies represents a continuation of the policies of colonial times. It has strengthened an elite class, with the effect that in India “Over

the post-Independence years, English has become the single most important predictor of socio-economic mobility. . . . With the globalized economy, English education widens the discrepancy between the social classes" (Mohanty, 2006, pp. 268–9).

The USA and the UK coordinated efforts to promote English as a "global" language from the 1950s. English language education as propagated by the British and Americans builds on five tenets, each of which is false: English is best taught and examined monolingually (the monolingual fallacy); the ideal teacher of English is a native speaker (the native speaker fallacy); the earlier English is taught, the better the results (the early start fallacy); the more English is taught, the better the results (the maximum exposure fallacy); if other languages are used much, standards of English will drop (the subtractive fallacy) (Phillipson 1992, pp. 183–218). These underpin the profitable global English teaching business.

Ongoing Tensions Between Linguistic Imperialism and Resistance

The conceptual framework elaborated above can serve to explore the questions raised initially in this entry in more depth. Analysis can be supplemented by documentation of educational experience in devising ways of counteracting linguistic imperialism (Canagarajah, 1999). Even if the volume of academic work in the area of macrosociolinguistics and language policy has increased dramatically over the past 20 years, much of it does not engage directly with issues of inequality, social justice, and the way a neoimperial linguistic world order is being reconstituted. Most critiques of a linguistic imperialist approach fall into this category and actually misrepresent it (e.g., Joseph, 2006). Accusations that it ignores agency, is excessively structuralist, and implies that education systems should not produce competent users of English (Pennycook, 2001) are invalid (Phillipson, 2009, pp. 15–18). The study of linguistic imperialism does not argue for or against particular languages. It analyzes how linguistic imperialism functions in specific contexts in order to identify injustice or discrimination so as to provide a basis for remedying them.

It is logical that people in many countries wish to develop competence in English, but in many postcolonial countries this entails subtractive learning. For instance, a consequence of education in Singapore being exclusively through the medium of English is that more than half the population now use English as the home language. English-medium schooling that neglects mother tongues can have this effect.

One development that strengthens global elite formation is the rapid increase in the number of English-medium international schools around the world, from around 1,700 in 2001 to 5,270 in 2009. The sector is "now worth \$18bn worldwide and set to double in value by 2020" with expansion mainly in India, the Middle East, and Asia (Hoare, 2009). Presumably many graduates go on to study at universities in "English-speaking" countries. It is likely that their linguistic roots in their cultures of origin will be weaker than their identification with the global economy and international mobility.

By contrast, the governments of the Nordic countries are determined that increased proficiency in English should in no way reduce the role of national languages. This principle is enshrined in a Declaration on a Nordic Language Policy, available in eight Nordic languages and English (www.norden.org). Many universities in Finland and Sweden have thus formulated language policies that aim at ensuring that their graduates and staff are in effect bilingual: Universities have a responsibility as publicly funded institutions to promote national languages, and as participants in an international community of practice they also need to function in English and other international languages. This exemplifies governments being aware of the risk of the negative impact of linguistic imperialism and taking measures to counteract it.

The European Union advocates policies to promote multilingualism and the goal of all schoolchildren becoming trilingual, so as to strengthen all EU languages. However, the management of multilingualism in EU institutions is exceptionally complicated, and market forces are strengthening the position of English nationally as well as in the EU system (Phillipson, 2008). There is therefore a risk of other languages being displaced and dispossessed of their linguistic capital.

The immense volume of scientific publication in English also serves to consolidate a hierarchy of languages. Scholars from the Spanish-speaking world increasingly need to publish in English (Mar-Molinero, 2010).

Linguistic imperialism is a reality in many contexts worldwide. An extreme case is the oppression that linguistic minorities are exposed to in China. A 2010 education plan for the Xinjiang Uyghur Autonomous Region is designed to assimilate Uyghurs to the dominant Han Chinese language totally and rapidly, this policy dovetailing with measures to crush traditional economic, cultural and religious practices of the Uyghurs. There are comparable measures of linguistic imperialism in Tibet.

Linguistic Landscape

DURK GORTER

Introduction

Linguistic landscape research is an emerging field of applied linguistics. In recent years increasing numbers of researchers have analyzed the texts on signs in public spaces in different sociolinguistic contexts around the world. These contexts are predominantly urban and multilingual. Although there were a number of forerunners in the 1970s and 1980s, the study of the linguistic landscape was inspired by the seminal study of Landry and Bourhis (1997), who also provided a definition that has been widely quoted: "The language of public road signs, advertising billboards, street names, place-names, commercial shop signs, and public signs on government buildings combines to form the linguistic landscape of a given territory, region, or urban agglomeration" (p. 25).

Most studies of the linguistic landscape have taken place in contexts that are unmistakably bilingual or multilingual. Other studies took place in a context, such as Tokyo, that at first sight seems to be predominantly monolingual. However, Backhaus (2007, p. 71) came across no fewer than 14 languages in the linguistic landscape of Tokyo. Japanese was clearly the dominant one but he found other languages such as English, Chinese, Korean, and Latin. Backhaus (pp. 12–63) also provided a detailed overview of 26 linguistic landscape studies until 2006. Half of them were carried out after 2000. Since his overview the field has continued to grow and numerous publications have appeared in different journals and in edited books. Only a brief overview of linguistic landscape studies can be given here.

Earlier Studies

Coulmas (2009, p. 13) observes that "linguistic landscaping is as old as writing." The public display of texts is one of the earliest functions of writing, coinciding with the beginnings of urban settlements. Some important examples have been handed down through history, such as the Old Babylonian language in cuneiform script, or the Egyptian hieroglyphs, which were deciphered in modern times through the trilingual Rosetta stone (Coulmas, 2009).

Early studies took place in cities such as Brussels, Quebec, and Dakar. Another example is the city of Jerusalem, where Rosenbaum and his colleagues (Rosenbaum, Nadel, Cooper, & Fishman, 1977) studied the use of English. In Keren Kayemet Street they analyzed the signs and also collected data on spoken language. They focus on the use of Roman script (almost all in English) versus Hebrew script. The signs reflect some differences between official language policy supporting the use of Hebrew-only signs and the more common commercial use of English in signs. A second study in Jerusalem in the 1980s concerned language choice on the signs. A "conditions model" of three rules was proposed: (a) write a sign in a language you know ("sign-writer's skill"); (b) write a sign in the language which can be read by the public ("presumed reader"); (c) write in your own language or the language you want to be identified with ("symbolic value") (Spolsky, 2009, pp. 32–4,

has an update). More recently other studies in Israel have contributed to reinforce the field (see Shohamy & Gorter, 2009).

Emerging Themes

Linguistic landscapes are studied from a variety of perspectives. Different approaches lead to theorization about multilingualism and analyze the dynamics of multilingual cityscapes. Current research covers a series of innovative empirical and theoretical studies that deal with language policy, the spread of English, minority languages, multimodality, and other issues such as language ecology, tourism, graffiti, or economic analysis.

Language Policy

Official language policies may comprise regulations about the languages used in the public space. Leclerc (1989) analyzed the laws of 181 national and regional states and found no uniform pattern in the legislation. Sometimes there are no rules at all and in other cases the public display of language is regulated in detail. Usually the authorities want to maintain some degree of control over the language(s) visible in the public domain. Language Act 101 in Quebec became notorious for its aim of preferring French over any other language (i.e., English). Regulation of the linguistic landscape can have important consequences for language use, but also for moral or legal aspects or even the physical dimensions (size, color, illumination, etc.). The aim can be to stop the spread of English or it can be to encourage the use of minority languages, for example, in place-names (Hicks, 2002). As Shohamy (2006, p. 129) says “Language in the public space . . . can also serve as mechanism for resisting, protesting against and negotiating de facto language policies.”

Regulation of signage is related more generally to the design of the public space. The abundance of signage in the multilingual cityscape may lead to an exaggerated prominence of certain types, such as huge billboards, which could be called “linguistic pollution.” In some cities, such as São Paulo, there have been clean-ups of the overabundance of signage.

Spread of English

Processes of globalization influence the use of English as a language used worldwide. English has an increasing presence in the visual scenery of the streets of most urban centers across the globe, in particular for commercial messages and information for tourists. The spread of English has been one of the motivators for the study of linguistic landscape, in the journal *English Today* among others. In many studies the dissemination of English in the linguistic landscape has been taken into consideration. Law 101 in Quebec (see above) tried to ban the use of English from public signage by proscribing a French-only policy. The provisions were later relaxed to permit other languages as long as French is “markedly predominant.” English on signage may also influence the local language system. Huebner (2006) demonstrates the influence of English on the Thai language in a study of the linguistic landscape of Bangkok. It concerns lexical borrowing as well as orthography, pronunciation, and syntax.

Minority Languages

Not all language groups have equal access to the linguistic landscape. Dominant national languages are often taken for granted, but minority languages may struggle for recognition and visibility. Specific groups can use the written signs in the public space to make their presence known in a territory. The degree of presence of minority languages in different

locations can be established by systematic research. Multiple interpretations could be given, for instance, by relating this to supportive or discriminatory policies, the degree of literacy, or the vitality of a minority language. Defacing of signs is often a token of language conflict (Hicks, 2002). The presence or absence of certain languages, and thus their speakers, can be meaningful (Shohamy, 2006, p. 110). Linguistic landscape research enriches the study of minority language groups, particularly because issues of power and resistance are central.

Cenoz and Gorter (2006) compared the use of the minority language in two cities in the Basque Country, Spain, and in Friesland, the Netherlands. The researchers found an effect of a stronger and a weaker language policy reflected in the linguistic landscape, because the two regions differed significantly. Barni (2006) studied the manifestation of immigrant communities in the Esquilino neighborhood of Rome. Traces of 24 immigrant languages were found, which showed the different symbolic strength of languages in a complex urban linguistic landscape.

Multimodality

The analysis of signs in the public space includes more than just the written language. Signs use more than one mode to communicate meaning. There are complicated connections between different parts of meaning making: language, color, symbols, placement, relative size, and use of space. These parts interact and affect each other.

In their analysis of multimodal texts, Kress and van Leeuwen (2006, p. 177) point out how principles of composition bring about the meanings of an image by three interrelated systems. First, the information value is in the placement of elements. Second, salience attracts the viewer's attention through size, foregrounding, or contrast. Third, framing of elements comes through dividing lines. Scollon and Scollon (2003) argue that we can interpret the meaning of public texts like road signs, notices, and brand logos only by considering the social and physical world that surrounds them. These researchers call their approach "geosemiotics," the study of the meaning of placing signs in the material world, which concerns the interaction of spatial, individual, social, and cultural contexts. Shohamy and Waksman (2009) also go beyond the written texts of signs and include verbal texts, images, objects, and placement in time and space, as well as human beings. Shohamy and Waksman propose an inclusive view of linguistic landscape as all texts situated in a changing public space, to show how multilingual and multimodal analyses can be applied.

Other Themes

Work on linguistic landscapes also covers a wide range of other themes. Studies have been carried out with different disciplinary backgrounds, such as a historical perspective, the application of sociological theories, or economic models. Other researchers have chosen a sociolinguistic or ecology-of-language approach. The study of the linguistic landscape in an institutional context, such as education (Dagenais, Moore, Sabatier, Lamarre, & Armand, 2009), seems a promising direction and could easily be extended to other institutional contexts such as libraries, prisons, or hospitals. Other researchers have looked at phenomena such as graffiti as transgressive, hybrid forms of text and picture, or at the visibility of languages for tourism, or at mixtures of language forms. The linguistic landscape can influence language attitudes, and speakers have preferences about the way languages are represented. Shohamy and Gorter (2009) contains chapters from different perspectives. The signs in public space can also be related to issues of language acquisition (Cenoz & Gorter, 2008) or to the social distribution of multilingual resources (Stroud & Mpendukana, 2009).

Methodology

Collecting data about the linguistic landscape has become a significant research tool, as well as an important data source for studies of multilingualism. Inexpensive digital cameras have enormously facilitated the data collection of texts on signs in the linguistic landscape. Georeferencing has become much easier in recent years and offers possibilities for detailed mapping of multilingualism in urban spaces. The technology is still young and will be further developed. Not all methodological issues have been solved and there are, for instance, problems in establishing criteria for the unit of analysis or improving comparability of sampling.

Some researchers have applied well-known methods and techniques such as interviews, standard questionnaires, or focus-group discussion to collect data about signage in public space. As an effective research tool, the systematic analysis of written language in the public space can be related to other data sources such as spoken language practices or language legislation.

The linguistic landscape has obtained popularity as an attractive topic among MA and PhD students of applied linguistics because of its easy accessibility. It also has great potential for use in a class on applied linguistics, on multilingualism, or on language policy. It can be used to raise language awareness and provide insight in many language-related issues.

Outlook and Further Expansion

Landscape linguistics is a rapidly emerging field of study, which is used as a research tool and as a source of data to document, to describe, and to theorize about multilingualism. Analytical frameworks are developed to examine and explain the dynamics of multilingual cityscapes, the limitations to managing the development of a linguistic landscape, and related phenomena of identity, policy, and language use in urban areas.

Overall, the various emerging perspectives in landscape linguistics are an additional source of information about multilingual and multimodal processes and can deepen our understanding of multilingualism, urban spaces, and language users.

Though the field of linguistic landscape studies is not without problems, the sort of work done thus far demonstrates its productivity. Linguistic landscape studies will certainly get more attention in the coming years as the results of several ongoing projects become available. Many questions are still open and there is a need for further data, refinement of methodologies, foundation of theories, and useful applications of languages.

Linguistic Legislation

JOSEPH-G. TURI

Introduction

In many modern states, the coexistence and contacts of numerous—and different—languages has become a common phenomenon, which often leads to a situation of linguistic conflicts and inequalities. Where these languages coexist in a dominant–dominated relationship which is indicative of a power struggle, a situation of conflict between linguistic majorities and minorities tends to result. Linguistic conflicts were significant during the 20th century. At the beginning of the new millennium, they are still important. *Linguistic neutrality* has been relegated to the past. *Linguistic intervention* has thus become increasingly prevalent. States must tackle these conflicts and their multidimensional ramifications by means of appropriate linguistic planning policies, which currently tend to translate more and more often into language legislation. Although linguistic policies do not always require the implementation of linguistic legislation, they usually do so as a rule.

Linguistic legislation is aimed at protecting or promoting the status and usage of one or more designated or identifiable languages in a state, at different levels, through legal language obligations and language rights which have been instituted to that end.

This kind of legislation falls within the domain of a new legal science, namely comparative linguistic law (or *language law*), which focuses on the law of languages, the language of law, and the relations between law and language. To the extent that language, which is the main tool of the law, becomes both the object and the subject of law, linguistic law becomes *metajuridical law*. To the extent that linguistic law recognizes and enshrines both linguistic rights (or *language rights*) and the fundamental right of all persons to be linguistically different, it becomes *futuristic law*.

The intervention of public authorities at all levels (national, regional, municipal, local, etc.) in the field of language is a relatively recent development, since it stems from two sets of contemporary phenomena: the democratization of education and the globalization of communications (Turi, Jie, & Jinzhi, 2006).

Typology of Linguistic Legislation

Linguistic legislation is divided into two broad categories (with a fair expanse of grey areas in between), in accordance with its field of application: official (or public) legislation and unofficial (or private) legislation. In addition, linguistic legislation may also be divided into four particular categories, according to its functions: official, institutionalizing, standardizing, and liberal.

Official Linguistic Legislation

This is legislation aimed at making one or more designated or identifiable languages legally compulsory—whether explicitly or implicitly, totally or partially, symmetrically or asymmetrically—as official or national languages in the official fields of legislation, justice,

2 LINGUISTIC LEGISLATION

public administration, and education. From the linguistic point of view, education is considered to be the most important of these fields, comprising the target of the majority of modern language legislation (Turi, Nelde, & Fleiner, 2001). A national language is the historical language, or one of the historical languages, of a country or of a region. An official language is the language, or one of the languages, of a state or of a region. Actually, the difference is not always so clear from a legal perspective. In some countries, the official and national language(s) may coincide. In China, Putonghua is defined as the “common” and “national” language, as well as the written language of the country; it is also described as “official” in some translations. Generally, knowledge of official language or of one of the official languages is a condition to becoming a citizen of a country.

One of two principles is applied to official languages in a given territory: linguistic territoriality (the obligation to use one language) or linguistic personality (the public obligation of a state to use more than one language and the private right of persons to choose between available official languages).

Making one or more languages official does not necessarily entail major legal consequences. The legal definition of officialization depends on the actual legal treatment accorded to languages. In some countries, there are *de jure* and *de facto* official languages. In Morocco, the only *de jure* official language is Arabic, but French is still the important *de facto* official language, since it is regularly used in official domains. From a constitutional standpoint, many states do not have *de jure* official languages, for example, Argentina, Japan, Germany, the United Kingdom, and the United States of America (at federal level). In these countries, Spanish, Japanese, German, and English, respectively, are the *de facto* official languages, coinciding in each case with the language in which the constitution is drafted.

If a state is officially bilingual, only public authorities have the obligation to be bilingual, while citizens may use the official language of their choice. An officially bilingual state may promote bilingualism among its population. In other cases, the contrary may apply in practice, for cultural or political reasons, or if the state is really officially bilingual. However, when one official language is more important than the other, the people who speak the less important language will tend generally to speak also the other official language.

Institutionalizing Linguistic Legislation

This is legislation which seeks to make one or more languages—whether explicitly or implicitly, totally or partially, symmetrically or asymmetrically—the normal, usual, or common language(s) in the unofficial fields of labor, communications, culture, commerce, and business. These fields can be unofficially unilingual or multilingual according to the circumstances. Communication is considered the most important of these fields from the linguistic point of view.

Standardizing Linguistic Legislation

This is legislation aimed at ensuring that one or more languages, considered as objects, conform to certain language standards in some specific official and unofficial fields. In the 20th century, Afrikaans, Hebrew, Hindi, and Indonesian were standardized in certain fields. The majority of modern language legislation does not belong to this category.

Linguistic legal rules are less rigid than grammatical rules. Language, as an individual and collective way of expression and communication, is a cultural phenomenon, difficult to appropriate and define legally (and also culturally, as is the case, for example, in former Yugoslavia). While grammatical rules are based on teacher–pupil relations, legal rules are applied, and applicable, insofar as they are in keeping with local custom and the behavior of reasonable people. Thus, linguistic legal sanctions, like criminal sanctions (fines or

imprisonment) and civil sanctions (damages, partial or total illegality), which are different from linguistic social sanctions (such as low marks at school, loss of social prestige, or loss of clients), are often limited to low or symbolic fines or damages.

Linguistic terms or linguistic concepts (e.g., "mother tongue") are the focus of language legislation only to the extent that they are formally understandable, intelligible, translatable, usable, or identifiable, or have some meaning in a given language. Linguistic legislation is aimed not only, objectively, at the language itself (as a cultural heritage of a nation or of a cultural group), but also, subjectively, at the speakers of a language (as linguistic consumers and users), unless the legislation is clearly a public policy law in some specific official or unofficial fields. A public policy law consists of fundamental norms that are, in general, absolutely imperative or prohibitive; the related legal sanctions can be formidable, such as total illegality. In the *Sutton Case* of 1983, confirmed by the Quebec High Court in 1983, and in the *Miriam Case* of 1984, the Montreal Court of the Sessions of the Peace and the Quebec Court of Appeal declared that, in certain given situations, Quebec's language legislation only applies to Francophones if they explicitly request to be served in French. It was thus concluded that Francophones can renounce their language rights, which suggests that the legislation in question is not deemed to be a public policy law (*Sutton Case*, 1983; *Miriam Case*, 1984).

In the *France Quick Case*, of 1984, the *Cour d'appel de Paris* acquitted a firm accused of using the terms "giant," "big," "coffee-drink," "bigcheese," "fishburger," "hamburger," "cheeseburger," and "milkshake," on the grounds that the terms and expressions were either fanciful, or were understood by the French consumers. True, the French *Cour de cassation* declared, in the *France Quick Case*, of 1986, that the goal of the French language legislation was the protection of the French language rather than Francophones (*France Quick Case*, 1984; *France Quick Case*, 1986). But the *Cour d'appel de Versailles* declared in respect of the same case, in 1987, that terms such as "spaghetti" and "plum-pudding" were legally French terms because they were "known to the general public" (*France Quick Case*, 1987). This legislation therefore protects both the Francophones and the French language. Legally speaking, a Francophone is anyone whose mother tongue or language of use is French.

Thus, any terminology that is linguistically "understandable" or "neutral" in unofficial fields is not generally targeted by language legislation. See Quebec's regulation regarding the language of commerce and business: "Any inscription, any sign or poster, and any commercial advertising may be presented by pictographs, by figures, by any artificial combination of letters, syllables or figures, or by initials" (R.S.Q., c. C-11, r. 9, A. 20).

Liberal Linguistic Legislation

This is legislation designed to enshrine the legal recognition of language rights and language minorities, explicitly or implicitly, totally or partially, symmetrically or asymmetrically. While linguistic rights are subjective in as much as they belong to any person, linguistic law, viewed objectively (as a set of legal norms relating to language), makes a distinction between the right to "the" language and the right to "a" language. The former is the historical right to use one or more designated or identifiable languages which belong to the majorities or to some specific minorities, especially in official fields, while the latter refers to the universal right to use one's mother or native tongue or any language, particularly in unofficial fields. These linguistic rights, which belong to natural persons and also to artificial persons, are similar to the principles of territoriality and personality. They are generally individual rights from a strict legal point of view, especially in relation to members of linguistic minorities, although naturally, they are individual and collective from a cultural point of view. They are also individual rights from a political point of view,

4 LINGUISTIC LEGISLATION

since states tend to be afraid of any possible coincidence between collective linguistic rights and the right to self-determination. That being said, the linguistic rights of aboriginal peoples are generally considered to be collective ones. A peculiar situation prevails in the province of New Brunswick (Canada), where the French and English communities are legally equal and also possess collective linguistic rights.

Linguistic rights are fundamental rights. For this reason, Article 58 of Quebec Bill 101 was declared anticonstitutional, in the *Ford* and *Devine Cases* of 1998, by the Supreme Court of Canada, as far as this article stated that public and commercial signs should be “only” in French (*Ford v. Quebec*, 1988, 2 S.C.R. 712; *Devine v. Quebec*, 1988). The article was repealed after the Human Rights Committee of the United Nations, in 1993, in the *McIntyre Case*, declared it incompatible with freedom of expression (*McIntyre Case*, 1993). In the *Ford Case*, the Supreme Court declared that “language is so intimately related to the form and content of expression that there cannot be true freedom of expression by means of language if one is prohibited from using the language of one’s choice.” Moreover, the Court declared that the article was also discriminatory because the distinction based on the “language of use” had the effect of “nullifying” the fundamental right to “express [oneself] in the language of one’s choice” (*Ford v. Quebec*, 1988, 2 R.S.C. 748). According to the Human Rights Committee, article 58 was not discriminatory. However, with regard to Article 35 of Bill 101, which requires that professionals should have an appropriate knowledge of the French language, the Supreme Court, in the abovementioned *Forget Case*, declared that the provisions of this article were nondiscriminatory (*Forget v. Quebec*, 1988).

In a country or region, there may be only one linguistic majority, yet one or more linguistic minorities. Since the definition of a linguistic minority is difficult to circumscribe, the most practical and acceptable solution is to describe a linguistic minority as a national group or cultural community whose language is spoken by less than 50% of the population of a country or region. Recognized linguistic minorities are generally historical communities, that is, those with deep and lasting roots in a country or in a given territory. In 1999, Italy declared Italian as its official language, while in the same Act, 12 recognized historical linguistic minorities were declared as “protected” in some official and unofficial fields and in some territories (Act No. 482, 1999). In the French province of Quebec (Canada), only Canadian “Anglophones,” that is, children of Canadian citizens who have received their tuition in Canada in English, may attend public English schools. In contrast, in Finland, there is freedom of choice between the Finnish and Swedish public schools. The 1992 European Charter for Regional or Minority Languages applies only to historical linguistic minorities. However, the Constitutional Council of France stated that the European Charter was incompatible in France with the principle of equality among citizens and with the French Constitution, which declares that French is the language of the Republic [Decision of June 15, 1999]. The situation is now changed with the new article 75-1 of the French Constitution, amended on July 21, 2008, which states that “The regional languages belong to the Heritage of France.”

Does this mean that, ultimately, new linguistic minorities are condemned to linguistic integration or assimilation? Article 27 of the 1966 International Covenant on Civil and Political Rights applies to all individual linguistic minority rights, including those of historical minorities, new minorities, and new immigrants, according to a 1994 General Comment of the UN Human Rights Committee (UN Human Rights Committee, 1994). This article recognizes the right of persons belonging to linguistic minorities to use their own language when communicating with other members of their group. The 1996 unofficial Barcelona Universal Declaration of Linguistic Rights states that linguistic rights, including “community linguistic rights,” are historical, and are also both individual and collective. The author of this entry is one of the signatories to the Barcelona Universal Declaration and also a member of the Follow-up Scientific Council.

Some of the modern language legislations in the world are neither liberal nor equitable, as far as some linguistic minorities are concerned—not only in the official fields, but also in the unofficial fields. In Indonesia, only Latin characters are permitted on public signs. This amounts to an implicit prohibition of signs in the Chinese language. On the other hand, in some countries, good examples of linguistic tolerance and freedom can be found, for example, in Finland (which has two official languages, and where genuine protection is afforded to the Swedish minority), in South Africa (with 11 official languages, and where the right to “a” language is specifically recognized), and in Canada and Australia (where a policy of multiculturalism is upheld).

Linguistic Diversity

The linguistic diversity of our world is one of its greatest cultural assets, even though the equation *language = culture* does not always coincide in all situations. We must take care of our linguistic diversity as we take care of the biodiversity of our planet. Therefore we should, legally and explicitly, recognize and enshrine not only the right to “the” language but also the right to “a” language, as well as the protection and promotion of linguistic minorities.

There are more than 6,000 languages (and thousands of dialects) in our world, according to UNESCO, which evolve continuously. But 75% of the world population speak 23 “great” languages; each of these languages is spoken by at least 1% of the population (60 million people). Here they are, in order of quantitative importance: Chinese, Hindi-Urdu, English, Spanish, Arabic, Bengali, Portuguese, Russian, Japanese, German, French, Malay, Javanese, Telugu, Tamil, Korean, Vietnamese, Marathi, Turkish, Italian, Thai, Iranian, and Gujarati. More than 3000 languages are spoken by only 4% of the world population. The Bible has been translated into more than 2,000 languages and dialects. There are international, national, regional, and local languages and dialects. There are, from a historical point of view, *dead* languages (among them, Latin!). All languages and dialects are equally dignified. But they are not all equal. A natural and sometimes artificial hierarchy is set up among languages. This is the linguistic and cultural reality of our world.

The right to “a” language in official fields should be enshrined in one way or another in accordance with higher legal norms, and with mandatory provisions, as is generally the case in respect of the right to “the” language. These legal norms should identify the holders and the beneficiaries of language obligations and language rights, as well as the legal sanctions that accompany these obligations and rights.

It is clear that states (at all levels) must take into account, in an equitable way, the national languages spoken by their citizens and inhabitants. But it is also clear that citizens and inhabitants must take into account, in an equitable way, the official language(s) of their states (at all levels). Equity is the key word for finding acceptable solutions in this field. One good solution, among others, would be to make all the national languages of the country legally official in a state, in an equitable way, in a symmetrical or asymmetrical way, to be determined in a nondiscriminatory way, according to circumstances.

Conclusion

The recent political trend in favor of *linguistic and cultural diversity* is indeed remarkable—provided, of course, that its most extreme expression, resembling a kind of a new religion, does not lead to further warmongering among nations. However, a recent tendency has also developed toward the protection of strong historical languages that are experiencing circumstantial problems, for instance, the officialization of the French language in France.

As a matter of fact, the languages that deserve legal protection more than the others are the vulnerable ones, that is, the lesser-used languages (spoken by fewer than a million, or not more than a few million speakers), the minority languages, and the languages that are faced with a particularly difficult linguistic situation. In order to ensure the maintenance and consolidation of linguistic group rights, positive state intervention is required. A linguistic laissez-faire attitude leaves minority groups vulnerable to linguistic hegemony of one or some languages.

The increasing legal intervention of states in the field of language shows that the globalization of communications has assumed such dramatic proportions that it must be controlled by legally protecting and promoting national, regional, and local languages, that is, the linguistic and cultural diversity of our world. Language law therefore recognizes the *linguistic regionalization* of our world and as such deserves our deep appreciation.

At the beginning of the new millennium, the natural Tower of Babel fortunately seems stronger than the artificial and technical globalization of communications. However, we must remain vigilant and take appropriate action.

This is why, in June 2006, the Galway-AIDL/IALL Tenth International Conference on Language and Law unanimously adopted a call to UNESCO for an International Convention on Linguistic Diversity (2006). This call should circulate, and receive full support, among all concerned persons, organizations, and nations who feel strongly about linguistic diversity issues.

Linguistic Relativity and Second Language Acquisition

PANOS ATHANASOPOULOS

Introduction

The principle of linguistic relativity was formulated by Benjamin Lee Whorf (1940/1956), but it is also often referred to as the Sapir–Whorf hypothesis in reference to Whorf’s mentor at Yale University, Edward Sapir. Whorf contended that while we all see the same objective reality, we nonetheless interpret and classify it differently, based on the categories made available in our language. Therefore, according to Whorf, speakers of different languages think and reason about the perceived world differently. For example, speakers of a language that uses one term to refer to the colors blue and green (a so-called grue term) evaluate the perceptual difference between blue and green stimuli as less significant than speakers of a language with distinct terms for blue and green (Kay & Kempton, 1984).

The past fifteen years have witnessed a surge of empirical research on linguistic relativity. Arguably, this surge of interest was kick-started by integrating methods used in experimental psychology with insights from anthropological and cognitive linguistics. Scholars such as John Lucy, Steven Levinson, Debi Roberson, and Dan Slobin have placed the experimental approach at the heart of the language and thought debate, emphasizing the need to measure both linguistic and, crucially, nonlinguistic performance in a range of linguistic and cognitive tasks. An increasing number of studies demonstrate effects of specific lexical and grammatical categories on specific cognitive processes such as remembering, thinking, and reasoning about the perceptual relationships of physical entities like colors, objects, and events (see Gentner & Goldin-Meadow, 2003; Roberson, 2005; Casasanto, 2008; Regier & Kay, 2009, for reviews).

Recently, this investigation has expanded to the field of second language acquisition, and researchers have begun to explore the possible effects of learning a second or foreign language on thinking and reasoning. One reason for this is that evidence from first language acquisition is accumulating, which shows that very early in life cognition is influenced by prelinguistic, possibly universal, predispositions to perceptual attributes of reality. However, later on, after experience with language, cognitive patterns are restructured according to language-specific partitions of reality (Levinson, 2001). Naturally the question arises as to whether cognitive patterns are permanently fixed by the L1, or whether additional language learning may also have an impact on those patterns.

In addition, Whorf considered knowledge of other languages crucial in understanding the thoughts and beliefs of speakers of those languages, and firmly believed “that those who envision a future world speaking only one tongue, whether English, German, Russian, or any other, hold a misguided ideal and would do the evolution of the human mind the greatest disservice” (Whorf, 1941/1956, p. 244). This statement resonates with scholars in the field of multilingualism itself, who emphasize the need to study L2 users in their own right rather than as imperfect versions of a monolingual native speaker ideal. For example, Cook’s (1991, 1992, 1999, 2003) multicompetence hypothesis views the person who speaks more than one language as an independent speaker/hearer/thinker, with linguistic and cognitive representations and abilities which are qualitatively distinct from

those of a monolingual person. Heeding the calls of Cook (2002), Pavlenko (1999), and others, researchers have begun empirically investigating the effects of second language acquisition on cognition in a variety of domains.

Domains of Enquiry

Grammatical Number and Object Classification

A number of studies have focused on categorization of objects and substances in noun class and classifier languages. Noun class languages like English distinguish between count and mass nouns grammatically. Count nouns refer to discrete entities that are marked for number (e.g., apple—apples). In classifier languages like Japanese or Chinese, there is no count/mass distinction. Nouns in these languages refer to substances and are accompanied by numeral classifiers (e.g., three small-piece-of apple [= 3 apples]). Speakers of the two types of languages were shown to perform differently on a similarity judgment task that required participants to match objects based on their common shape or material. Speakers of English favored shape and speakers of Japanese favored material, presumably because noun class languages draw speakers' attention to discreteness of entities and classifier languages to material (Lucy, 1992; Imai & Gentner, 1997). Cook, Bassetti, Kasai, Sasaki, and Takahashi (2006) found that Japanese speakers of L2 English who had stayed in the United Kingdom for more than three years tended to make shape-based similarity judgments significantly more than those L2 speakers who had stayed in the United Kingdom for less than three years. Athanasopoulos (2007), using a similar task with two groups of Japanese and English monolinguals and two groups of Japanese speakers of L2 English, one given task instructions in English, and one given task instructions in Japanese, found that both L2 groups displayed behavior that was "in-between" the two monolingual groups, with language of task instruction playing a nonsignificant role.

Athanasopoulos and Kasai (2008) extended the design of the two previous studies by implementing a similarity judgment task using artificial novel two-dimensional objects. They asked two groups of Japanese and English monolinguals and two groups of Japanese speakers of L2 English (one intermediate and one advanced) to match the objects based on either common shape or common color. Results showed that overall, all participant groups made primarily shape-based classifications. However, the degree to which they did so differed, with Japanese monolinguals favoring shape significantly less than English monolinguals. The intermediate L2 group exhibited primarily L1-based behavior, resembling Japanese monolinguals, while the advanced L2 group exhibited primarily L2-based behavior, displaying similar patterns to the English monolinguals.

Athanasopoulos (2006) adapted a picture-matching task used by Lucy (1992) that requires participants to judge the similarity between pictures based on the number of countable and noncountable entities. The task was given to Japanese and English monolinguals, and two groups of Japanese speakers of L2 English, one with intermediate and one with advanced English proficiency, as measured by the Quick Oxford Placement Test and a grammaticality judgment task. English monolinguals showed increased sensitivity to changes in the number of countable objects than to changes in the amount of noncountable substances, thus reflecting the count/mass distinction in their native language. Japanese monolinguals treated both types of entities equally, reflecting the lack of a grammatical count/mass distinction in their language's quantification system. Intermediate L2 speakers were heavily influenced by their L1 in their similarity judgments, resembling Japanese monolinguals. Advanced L2 speakers on the other hand resembled more English monolingual speakers, tending to differentiate between countable and noncountable entities in their judgments.

Color Categorization

Studies have focused on both semantic representation and cognitive categorization. In studies of the first kind, participants may be asked to name separate color chips or to indicate the best example (prototype) of particular color terms on a color chart. Andrews (1994) and Athanasopoulos (2009), replicating and extending earlier studies by Ervin (1961) and Caskey-Sirmons and Hickerson (1977), gave such tasks to Russian and Greek speakers who were speakers of L2 English. Russian and Greek make an obligatory lexical distinction between light and dark blue (*ghalazio* and *ble* in Greek, *goluboj* and *sinij* in Russian). Results showed that L2 speakers shifted the prototypes of their native blue categories under the influence of English. This effect was more pronounced in L2 speakers who had spent a significant amount of time in an English-speaking country (since childhood and adolescence in the case of Andrews, 1994, and for at least two years in the case of Athanasopoulos, 2009). In a cognitive task, Athanasopoulos (2009) further demonstrated that the longer Greek speakers of L2 English had lived in the UK, the more likely they were to judge light and dark blue color chips as more similar to each other, suggesting a weakening of the distinction between *ble* and *ghalazio* in their cognitive representation of those categories. Japanese also uses different terms to distinguish two shades of blue. Athanasopoulos, Damjanovic, Krajciová, and Sasaki (2011) found that Japanese L2 speakers of English who used the L2 more frequently did not distinguish between light and dark blue color stimuli as much as Japanese L2 speakers of English who used the L1 more frequently (both groups were living in the UK and were of comparable L2 proficiency).

Grammatical Gender

Kurinski and Sera (2011) carried out a longitudinal investigation of whether learning Spanish grammatical gender changes object categorization patterns of English native speakers of beginner level Spanish L2. A group of advanced learners and a group of Spanish native speakers were also tested. The authors present converging evidence from a test specifically measuring acquisition of Spanish grammatical gender, and from a task measuring voice attribution patterns to pictures of objects. In this task, participants are typically shown pictures of objects and asked to assign a male or female voice to them if they were to come to life. Previous studies have shown that speakers of languages that mark grammatical gender on nouns tend to assign voices to objects consistent with the objects' grammatical gender in their native language (Sera, Berge, & del Castillo Pintado, 1994). Results from the Kurinski and Sera (2011) study showed that learning a second language with grammatical gender does make voice attribution patterns more consonant with that language's grammatical gender, and this shift in cognition increases with the level of proficiency in the L2. However, results also showed that patterns of advanced L2 speakers in their study did not become identically similar to the patterns exhibited by native speakers of the L2.

Kousta, Vinson, and Vigliocco (2008) showed that ItalianEnglish bilingual speakers' semantic representation of grammatical gender was similar to that of Italian monolinguals only when the task was performed in Italian, but not in English. Contrary to Sera et al. (1994), Kousta et al. (2008) found no effects of grammatical gender on nonlinguistic cognition.

Time

Boroditsky (2001) conducted a study on the conceptualization of time in Mandarin Chinese and English speakers. In English, reference to time is made using horizontal spatial metaphors (e.g., there are good times ahead of us/let's push the meeting back/forward, etc.).

In Mandarin, reference to time can also be made using vertical spatial language (using “up” to refer to the earlier events and “down” to refer to later events). Boroditsky (2001) asked participants to verify target statements about time (e.g., March comes before April), preceded by prime pictures displaying either horizontal or vertical spatial scenarios (e.g., two fish one on top of the other or two fish one next to each other). Results showed that the extent to which Mandarin users of L2 English think about time vertically was related to how old they were when they first began to learn English. The younger the L2 users were when they started learning English, the less likely they were to follow the Mandarin pattern of thinking about time. In a follow-up experiment, native English speakers were trained to talk about time using vertical spatial terms in a similar way to Mandarin. Upon testing, these English speakers showed a bias to think about time vertically, approximating Mandarin native speakers. Subsequent studies however failed to replicate Boroditsky’s (2001) results in similar experiments (Chen, 2007; January & Kako, 2007), casting doubt on the validity of Boroditsky’s results as evidence for linguistic relativity.

More recently a study by Miles, Tan, Noble, Lumsden, and Macrae (in press) demonstrated that Mandarin–English bilinguals do indeed employ both horizontal and vertical representations of time, while cultural context seemed to affect the way these time lines were deployed.

Action Events

Boroditsky, Ham, and Ramscar (2002) investigated event perception in English and Indonesian monolingual speakers and Indonesian L2 users of English in a range of similarity judgment and memory tasks. English uses tense markers to distinguish grammatically between past, present, and future. In Indonesian there is no obligatory grammatical distinction of temporality. Instead, speakers of Indonesian use contextual information, coupled with temporal words (e.g., “just now,” “soon,” etc.) to infer the tense of an action. In one experiment, participants were asked to rate the similarity between pictures that show either two different actors performing the same action in the same tense, or the same actor performing the same action in two different tenses. Results showed that English speakers rated same-tense pictures as more similar than Indonesian speakers did, and different-tense pictures as less similar than Indonesian speakers did. Indonesian users of L2 English rated same-tense pictures more similar when they were given task instructions in English than when the task instructions were given in Indonesian. Conversely, they also rated different-tense pictures less similar when they were tested in English than when tested in Indonesian. The Indonesian L2 English users that were tested in Indonesian showed a pattern that was somewhere in-between the pattern shown by monolingual Indonesian speakers and the pattern shown by English speakers.

In another experiment, Boroditsky et al. (2002) tested Indonesian and English monolinguals’ and Indonesian L2 English users’ ability to remember action events. Participants were shown pictures of people performing actions (these were the same pictures used in the similarity judgment experiment described earlier). During the learning phase, each participant saw a person performing an action in one of three tenses. During the test phase, subjects were shown pictures of that person performing the action in all three tenses and asked to choose which one they had seen previously. English speakers were better than Indonesian speakers at remembering the tense in which they witnessed an action.

The L2 users were better able to remember the tense of actions when they were given task instructions in English than when they were given task instructions in Indonesian.

Conclusion

Recent research has begun to investigate the question of whether someone who learns a second language may also acquire new concepts and gain a different perspective of the world. The research is still in its very early stages, but some studies do suggest that acquiring a second language may transform the thinking of the individual. This new line of research has focused on specific domains of enquiry and on specific cognitive processes, including sorting, matching, and remembering. The application of the Whorfian hypothesis to second language acquisition has the potential to reveal invaluable information about how the mind of the L2 user views the world as a result of speaking specific languages; yet research is still at a very early stage, and the precise role of specific linguistic and sociocultural factors, as well as the extent of the effects in different perceptual domains, remains elusive for the time being (see Jarvis & Pavlenko, 2008; Athanasopoulos, 2011; and Pavlenko, 2011, for detailed discussions). All information correct at the time of first submission in March 2010.

Literacy and Bidialectalism

CAROL D. LEE

In K-12 education, language acquisition and variation often address bilingualism. However, for native speakers, dialect differences can influence opportunities to learn.

Learning academic language involves processes similar to language acquisition for young children and second language learners (Gee, 1994). For both these groups of language learners, acquisition is never straightforward, characterized by predictable errors, where learners apply rules of regularity to irregular language forms. In a similar vein, novice learners who speak a nonstandard dialect will make mistakes while learning to speak, think, and write in academic language. Academic language refers to specialized vocabulary that characterizes reading and writing in school, as well as the genres, modes of argumentation, and specialized vocabularies of academic disciplines through middle and high school (Lee & Spratley, 2009). Academic language, particularly disciplinary languages, exemplify social registers, ways of talking that characterize participation in specialized communities of practice (e.g., how lawyers speak in making arguments in court), including identification with and membership of such communities. Dialect differences can pose specialized challenges to access in and membership of such academic communities. One can acquire the form (e.g., genres and syntax) of American mainstream academic English and yet be evaluated negatively because of phonological and prosodic dialect differences. Northeastern seaboard dialects continue to have greater mainstream status than southern dialects, particularly those associated with class distinctions (e.g., Appalachian English). Educational mobility often requires that students relinquish home dialects, particularly low-status dialects from mainstream academic perspectives. These issues are challenging because they can bifurcate affiliations between home and school.

Learning particular ways of speaking involves socialization about who can speak, how, and about what (Ochs & Schieffelin, 2001). Such norms are important for communities of practice, from family routines (e.g., talk around dinnertime or telling personal narratives) to classrooms (e.g., where turns of talk are controlled by the teacher and where posing and answering known questions are the norm). Studies have documented the impact of dialect differences on opportunity to learn (Cazden, John, & Hymes, 1972). A classic study is Heath's (1983) longitudinal ethnography in the Piedmont Mountains of the Carolinas, *Ways With Words*. Heath documented differences in who could speak, how, and about what in storytelling, a boundary marker between home and school at the primary level. White low-income families valued strict turn-taking rules and personal stories that did not veer from the literal truth and literal text interpretation, in part because of religious traditions requiring literal biblical interpretation. In contrast, Black low-income families who spoke African American Vernacular English (AAVE) valued turn-taking rules where even young children bid competitively for the floor through complex figurative rhetorical displays, and personal stories that revealed some aspect of a shared experience not easily visible to adult observers. These interactional patterns were valued in different ways in children's schools that did not scaffold linguistic repertoires students developed through family language practices.

Substantive research on dialects of American English includes reviews of dialect variation, literacy, and instruction (Ball & Farr, 2003): African American Vernacular English (Mufwene,

2 LITERACY AND BIDIALECTALISM

Rickford, Bailey, & Baugh, 1998), Puerto Rican English (Wolfram, 1974), Appalachian English (Wolfram & Christian, 1976), varieties of American Indian English (Wolfram, Christian, Potter, & Leap, 1979), Vietnamese English (Wolfram & Hatfield, 1984), among others. Dialect differences include: vocabulary (e.g., *soda* on the east coast versus *pop* in the midwest); syntax (e.g., the use of the habitual *be* and the double negative in AAVE; or the a-prefix in Appalachian English, as in “And we’s a-gonna chop the coon out if it was in there,” Wolfram & Christian, 1976, p. 181); the formality of registers (e.g., the use of *sir* or *ma’am* in southern dialects); or routine kinds of speech genres (e.g., verbal games of ritual insult in AAVE). Some dialects include hybrids of several national languages, such as Tex-Mex or Spanglish (a hybrid of southern English and Spanish), or a mix of several dialects of the same national language or other national languages, such as Puerto Rican English, which includes New York English dialect, African American Vernacular English, and Spanish.

Lee (2005) has identified dialect misconceptions shared broadly in both the public and schooling (pp. 243–4):

1. *Some dialects are linguistically superior*: Linguists have long documented the systematicity and complexity of nonstandard dialects. Most have focused on AAVE. Labov’s (1972) *Language in the Inner City* and Smitherman’s (1977) *Talkin and Testifyin* are classic studies.
2. *Mainstream and nonmainstream dialects are not related*: Conceptions of mainstream are both social and political constructions. What is presumed mainstream changes often imperceptibly over time. For example, in 2011 even educated English speakers say “It’s me” rather than “It is I” or may not maintain consistent alignment between noun and pronoun referents (e.g., “A parent should look after *their* child”). Many syntactical structures in Elizabethan English are considered grammatically incorrect today. Also, popular media strategically appropriate vocabulary and syntactical and prosodic forms from so-called nonmainstream dialects. In addition, great literary works appropriate nonstandard dialects in the dialogues, often in contrast to a standard dialect used by the narrators in the same works.
3. *Members of ethnic or regional groups speak the same dialect*: The pragmatics of face-to-face communication and class differences within groups influence variation in dialect usage. For example, code switching within and across dialects certainly occurs. Orlando Taylor has documented vernacular and standard variations in AAVE where vernacular versions involve prototypical syntactical patterns that may not occur in the standard version, but speech genres and prosodic and rhetorical features remain similar across both versions. Also, speakers growing up learning a dialect associated with lower income status who achieve middle-class status may use the social dialects of their childhood with family but Standard English in professional interactions.
4. *Dialects are unchanging*: Some say the only difference between a dialect and a national language is an army. All languages evolve over time, influenced often by interactions among nations (e.g., the Norman language of northern France and the Latin of the Catholic Church in the development of modern English). The English spoken varies between countries such as Great Britain, Nigeria, India, Australia, New Zealand, Jamaica, and Canada. Within each are regional and class dialects. Historical changes within English are often imperceptible within generations. For example, the double negative was acceptable in Old and Middle English, whereas sentences such as “They can’t do anything” is a relatively new construction.
5. *The only influence on dialects of English is British English*: Presumptions about British English have impacted literacy instruction in US schools. For example, it was many years before American literature was presumed appropriate for study in US universities. Even today, most US high schools require British literature. Twenty-first century

US English has influences from many immigrant groups. In regions with large Latino populations, vocabulary reflecting Spanish origins is integrated into everyday speech. Vass (1979) has documented influences of West African languages on English, particularly in the south, largely because of the significant representations of peoples of African descent as a consequence of the African Holocaust. In addition, research documents the influence of West African languages on African American English (e.g., syntactic forms, vocabulary, phonology, prosody, even speech genres) (Mufwene, 1993). Thus, in many ways, dialect variation embodies historical interactions and dependencies among different groups of people.

Dialect Variation and Opportunity to Learn

Dialect variation is often associated with class and ethnicity. The status associated with such variation is not a consequence of any inherently superior or inferior linguistic features, but rather of political and institutional power structures. Smitherman (2000b) refers to Standard American English as the English of Wider Communication. Young people gain access to this English of Wider Communication through formal schooling, serving as a form of social capital for entrance to higher education and particular forms of work. Because of our capacity as humans to learn multiple languages, including multiple dialects of a national language, one can think of language learning in formal schooling as expanding repertoires, rather than eliminating students' everyday linguistic repertoires.

However, cultural deficit assumptions have informed and continue to inform efforts to eradicate certain English dialects through schooling, with AAVE as the most common target. In the 1970s, phonological and syntactic differences between AAVE and Standard English were hypothesized to interfere with learning to read (Rickford & Rickford, 1995), for instance distinguishing between words like *told* and *toll*, *mist* and *miss*, *four* and *foe*, or pronouncing words ending in /th/ (e.g., *breadth*, *mouth*, and *bath*) as though they ended in /f/ (Labov, 1995, p. 47). There are also differences with regard to the use of tense markers (e.g., the habitual *be* in AAVE, as in "he be here all the time") or the use of double negatives in AAVE (Smitherman, 1977). However, as indicated earlier, all speakers of a given dialect do not employ all its features all the time, suggesting pragmatic code switching. In addition, Wolfram, Adger, and Christian (1999) say that speakers of vernacular dialects often have greater understanding of their and the mainstream dialect than those who speak only the mainstream dialect.

The dialect interference hypothesis was tested, including developing dialect readers. However, because of negative reactions from teachers and parents, the readers were never implemented. These reactions to any explicit focus on AAVE in the school curriculum are similar to highly charged debates in 1996 over the decision of the school board in Oakland, California, to address AAVE competencies as a springboard for reading and writing instruction (Perry & Delpit, 1998). Linguists and educators in both the 1970s and the 1990s have weighed in on these debates, in both eras affirming the right of students to their home languages and dialects and that one dialect is not inherently superior or linguistically more complex than another.

Experimental studies on dialect interference in reading provide interesting and nuanced results. Rentel and Kennedy (1972) tested dialect interference with Appalachian English speakers and found no improvement in reading achievement by teaching Standard English phonology. Other studies on dialect interference with AAVE speakers did not support the hypothesis. Labov (1972) found that junior high AAVE speakers comprehended past-tense markers half the time, suggesting that lack of understanding tense differences was not universal among AAVE speakers. As Labov (1995) notes, "The conclusion of most socio-linguists was that the semantic and structural differences between AAVE and other dialects

4 LITERACY AND BIDIALECTALISM

were not great enough to be the primary causes of reading failure. Dialect differences affected education primarily as symbols of social conflict" (p. 49).

Another argument about the impact of dialect variation associated with class goes beyond morphological differences to include hypothesized deficits in vocabulary and experiences with books. Hart and Risley (1995) are most often cited documenting huge differences between the vocabulary and extended language interactions between low-income and middle-income children and their parents. While the study does not directly address the question of dialect, the low-income families observed most likely spoke a nonstandard dialect. Extrapolations from this study to early literacy practices imply a singular pathway for learning to read that does not conceptually lead to considerations of other kinds of linguistic repertoires that children from low-income families who as a consequence speak a low-status dialect may indeed develop from their participation in family and everyday life. Such repertoires can include exposure to hearing and producing different narrative structures, hearing and producing complex rhetorical forms, as well as a range of life experiences relevant to the comprehension of multifaceted scripts and characters in complex story lines in books and films (Lee, 1997). While there are limited curriculum designs to test this hypothesis, there is a sufficient body of related research to warrant testing this premise.

Testing the relevance of experience to vocabulary understanding, Williams and Rivers (1972) found

when vocabulary on . . . [the] test was changed so that it reflected their experiential network, poor black children in the St. Louis public schools performed at a level comparable to the white middle-class sample on which the test was standardized.

Hall, Reder, and Cole (1975) examined the impact of the pragmatic context on story recall among a sample of 32 Black and White children aged 4 years 6 months. They found "whites performed better than blacks in SE; blacks performed better than whites in VBE; blacks tested in VBE were equivalent to whites tested in SE; and whites performed better in SE than in VBE."

Differences in narrative conventions have also been documented in sociolinguistic studies, particularly with regard to AAVE. These include topic-associative narratives with Black children and topic-centered narratives with White children in kindergarten (Cazden, Michaels, & Tabors, 1985). The teacher hearing the topic-associative narratives was not able to scaffold the children's learning because she could not understand the coherence of the stories. In a secondary analysis of one of the topic-associative narratives from the Cazden, Michaels, and Tabors corpus, Gee (1989) argued these narratives were more literary and complex than the topic-centered narrative valued by the school. Champion (2003) has perhaps done the most extensive research documenting oral narrative patterns among African American English-speaking young children, examining a much larger array of patterns than found in the earlier research. In addition, Champion has documented—similarly to the earlier studies by Williams, Rivers, Hall, Reder, and Cole on vocabulary understanding and story recall—that the contexts under which these linguistic resources are elicited matter for quality and complexity. That is, contexts matter for displays of competence.

While most research on opportunities for literacy learning and dialect variation has addressed young children, Lee (2007) has focused on scaffolding competencies of AAVE-speaking high school students to support the interpretation of complex literary texts. Moving beyond the traditional focus on morphological and syntactic features, Lee's research addresses kinds of knowledge embedded in speech genres. Through a design framework Lee calls "cultural modeling," she examined a genre of ritual insult called "signifying"

(e.g., “yo mama so skinny she can do the hula hoop in a cheerio”). Drawing on earlier sociolinguistic research on the uses of figuration in signifying (Smitherman, 1977), Lee argued that knowledge of signifying is largely tacit; and that the knowledge to recognize and produce metaphor, similes, symbols, irony, satire, and even unreliable narration in this oral genre was akin to both the knowledge and dispositions required to tackle complex literary problems. Through the use of what Lee calls cultural data sets (e.g., everyday texts, such as signifying dialogues, rap lyrics, etc.) underachieving African American high school students were able to make explicit the strategies they used and to activate dispositions valuing figuration, and then to apply them to canonical literary texts. Pre–posttests have shown significant improvement in literary comprehension.

Dialect Variation and Writing Instruction

Again, much of the research on writing instruction and dialect variation focuses on AAVE. However, in contrast to what is largely a deficit orientation in reading, much of the work in writing encompasses linguistic resources among older students. Shaughnessy (1977) studied how typical errors in the writing of community college students reflected oral patterns of dialect differences. Her study had significant impact on the college composition community by helping instructors understand the logic of students’ errors, many of which are rooted in dialect variation. Ball (1992) has documented preferences in expository styles among high school AAVE speakers: circumlocution, narrative interspersion (e.g., interspersing a narrative within an expository text), and recursion (restating an idea using different words or images). Ball found these patterns in students’ writing without any direction from teachers but also in political and religious oratory within the African American community, yet they were negatively evaluated by writing teachers. Smitherman (2000a) conducted a post hoc examination of writing samples of African American students on the 1984 and 1988/1989 National Assessment of Educational Progress (NAEP). She analyzed the samples to see if there were differences in uses of AAVE syntax and discourse styles between the two testings, whether there were relationships between AAVE syntax and discourse styles, and finally whether the primary trait and holistic scorings were related to the use of AAVE discourse styles. While she found no relationship between AAVE syntax and AAVE discourse styles, she did find that higher ratings on both primary trait and holistic scoring were related to the presence of AAVE discourse styles. Smitherman (1994) has associated AAVE discourse styles in writing to what she calls the African American rhetorical tradition, which includes (a) rhythmic, dramatic, and evocative language; (b) reference to color, race, and ethnicity, even when the topic does not require it; (c) use of proverbs, aphorisms, and biblical verses; (d) sermon tone associated with the styles of African American largely Baptist preaching; (e) a conversational tone involving direct address; (f) cultural references; (g) ethnolinguistic idioms; (h) verbal inventiveness and unique nomenclature; (i) cultural values and community consciousness; and (j) field dependency. Field dependency involves viewing a phenomenon in its holistic context. Smitherman’s analysis is important because it is post hoc (i.e., the evaluations of quality had already taken place).

Related to Smitherman’s documentation of uses of AAVE rhetorical styles, Lee, Rosenfeld, Mendenhall, Rivers, and Tynes (2003) extended the work in cultural modeling to focus on narrative composition with primary and middle grade students. Writing prompts included pictures of prototypical scenes from African American life, many by artist Annie Lee. Lee et al. found uses of AAVE rhetorical styles in the samples of African American students across the grades, and again a positive relationship between narrative quality and the AAVE rhetorical style.

Dialect and Instructional Discourse

One final dimension of dialect variation impacting opportunity to learn is its use in instructional discourse. Talk in classrooms provides one primary medium through which negotiations of learning take place. Studies have documented how negative evaluations of nonstandard dialects influence opportunities to participate in instructional discourse (Cazden, 2000; Cazden et al., 1972). Studies document how access to nonstandard dialects can enhance levels and quality of participation in instructional talk (e.g., Foster, 1987; Gutierrez, Baquedano-Lopez, & Tejeda, 1999). Lee (2007) has documented how multiparty overlapping talk involving AAVE discourse styles is associated with greater intensity of participation among high school AAVE speakers. There is limited research in this area. However, logically the proposition of having students' home dialects available as one medium of communication in instructional dialogues is similar to arguments about classrooms involving English as a second language.

Conclusion

Historically, arguments about the use and relevance of nonmainstream English dialects have viewed access to such dialects in school-based learning as either an asset for scaffolding or a deficit to be overcome. Sociolinguists, however, have consistently expounded the logic and complexity of nonstandard English dialects. The challenges of transforming the sociolinguistic research in practice have been twofold: First, broad public folk theories prevail about dialect variation reflecting deficit views; second, substantive linguistic knowledge is required by teachers to comprehend fully and to scaffold the resources of nonstandard dialects to support formal academic learning.

Literacy and Heritage Language Maintenance

JIN SOOK LEE

Heritage language (HL) maintenance refers to the preservation of an immigrant (e.g., Japanese, Chinese, Hebrew, Russian), an indigenous (e.g., Cherokee, Zuni, Chumash), or a colonial (e.g., Spanish, French, or German from earlier settlers in North America) language (Fishman, 2001). As one of the primary markers of ethnic and cultural identity, the maintenance of a heritage language has been an important point of concern for most ethnic groups in the United States. Some see it as a symbol of resistance to full assimilation to the host country, while others view it as a connection to their roots and a necessary means of communication within the family. However, when HL maintenance is viewed from an additive perspective (i.e., an HL is maintained alongside the acquisition of English), it yields many benefits. For example, recent studies show that HL maintenance leads to higher self-esteem (Phinney, Romero, Nava, & Huang, 2001), stronger sense of linguistic and cultural identity (Lee, 2002), and stronger family cohesiveness and social relationships (Tannenbaum, 2005). In addition to these personal benefits, HL speakers who develop strong proficiency in both English and their HL can also fill the critical need for multilingual speakers in global business and national-security sectors.

In spite of these benefits, assimilative social and linguistic pressures as well as the lack of educational opportunities to learn and use HLs in the public sphere have made HL maintenance very difficult for linguistic minorities. Most linguistic-minority groups in the United States completely lose proficiency in their HL by the third generation (Veltman, 1983). Many studies suggest a range of variables that may support HL maintenance: political, social, and demographic factors such as number of speakers, proximity to homeland, and strength of ethnic affiliation; cultural factors such as attitudes, ethnic identity, and family ties; and linguistic factors such as linguistic practices and the status of the language (Fishman, 2001). Yet little is known about how these factors interact with one another to support or constrain HL maintenance among different individuals. However, most scholars agree that HL maintenance begins with the will of the individual and family (Fishman, 2001; Valdés, 2001).

The centrality of the home and family context has shaped the kind of linguistic competence that typically develops among HL speakers. For example, speakers in the home context are likely to place more emphasis on oral skills than on literacy skills. This pattern is reflected in the description of HL speakers, who are typically descendants of first-generation immigrant parents that “speak or at least understand the language and are to some degree bilingual in the home language and in English,” but rarely have literacy skills in their HL (Valdés, 2001, p. 38). Despite the critical nature of literacy, literacy development among HL speakers has not received much attention in the HL literature. To address this important issue, this entry discusses literacy’s important role in HL maintenance and examines the challenges and potential support systems for HL literacy development, raising awareness of the need for more systematic approaches to HL literacy education.

What Is HL Literacy?

Traditionally, literacy has been viewed as a skill to encode (i.e., write) and decode (i.e., read) text. However, more recently, literacy scholars have begun to see it as a social and culturally determined construct that includes the ability to use language skills in socially appropriate situations with appropriate registers (Street, 2005). In this context, HL literacy encompasses not only knowing how to write and read in the HL, but also understanding the socioculturally relevant and appropriate ways in which literacy is used in the heritage communities. Studies have documented that language-minority families practice HL literacy in different ways: Specifically, they practice with different kinds of HL texts, for different purposes, and with different outcomes (Kenner, 2004). For example, some families use HL literacy to bond, as parents and children partake in reading comic manga (Japanese books) together; in other families, HL literacy is employed as a means for non-English-speaking parents to provide their children with additional assistance in their school work; and, finally, for others, HL literacy enables HL speakers to communicate with people in their home countries through the Internet. Hence, HL literacy serves different functions for different individuals and their families in ways that (re)connect them with elements that, for them, have personal, symbolic, or ethnic relevance.

Successfully developing HL literacy skills generally requires some form of explicit instruction. Inopportunistically, for many HL speakers, instruction in their HL is not widely available, particularly if it is one of the less commonly taught languages in the United States (e.g., Tagalog, Korean, Japanese, or Russian). However, depending on the language and location, there are programs that offer HL literacy instruction. For example, instruction can take place in several kinds of venues: HL weekend schools, where students meet for several hours to learn the language as well as to explore cultural traditions; institutions where religious study is offered through the HL; foreign-language classrooms; dual-language immersion schools, whose mission is to promote biliteracy and bilingualism for both language-majority (e.g., English speakers) and language-minority (e.g., Spanish speakers) children; and study-abroad programs (recent research shows that the majority of the participants in college study-abroad programs in Asia, Africa, and Latin America are HL learners; Rubin, 2004).

Certain venues of instruction are more established for some HLs than others. HL weekend schools are common in Korean, Chinese, Japanese, Russian, Armenian, and Greek communities, for example, but rarely found in Spanish- and French-speaking communities. In contrast, HL speakers of Spanish and French, for instance, often have opportunities to enroll in Spanish or French foreign-language classes through school programs, although that instruction is typically geared toward foreign-language learners rather than HL speakers. Despite the availability of such programs, HL literacy development has been largely unsuccessful for most HL speakers. To date, one of the most promising venues for HL literacy instruction is through dual-language immersion programs that instruct academic content through the use of two languages. For HL speakers, the program offers a valid and genuine purpose for HL literacy skills. Although to date most programs only offer instruction in Spanish–English, establishing dual-language immersion programs in diverse languages may improve the developmental patterns of HL literacy.

The Importance of Developing HL Literacy

One obvious goal and benefit of HL literacy development is the promotion of HL maintenance. For communities where the drastic decrease in numbers of speakers endangers the survival of particular languages, literacy may be the only way in which HLs can be

passed down from generation to generation. Text-based literacy can also foster HL maintenance for individuals who live in communities with limited access to other HL speakers. In such cases, immigrants' interactions with print media such as books, newspapers, and Web sites in their HL can provide greater HL exposure apart from home language use. Moreover, HL literacy enables individuals to participate in a wider array of communicative functions, such as writing letters or e-mails to relatives, reading menus in ethnic restaurants, reading literature from the heritage culture, and engaging in religious practices through the use of the HL (e.g., using Arabic to read the Koran or speaking Hebrew in prayer). Thus, having competence in HL literacy skills makes varied forms and registers of the HL accessible.

In addition to these direct advantages, studies have also shown that HL literacy is linked to other desirable outcomes such as higher academic performance (August & Shanahan, 2006), greater educational and occupational aspirations (Stanton-Salazar & Dornbusch, 1995), and stronger cognitive flexibility (Cummins, 1981). Furthermore, Krashen (1998) found that HL literacy has a strong positive effect on HL speakers' ability to learn other foreign languages, whereas HL oral proficiency, combined with the absence of literacy skills, had little effect. Therefore, for ethnic individuals, HL literacy provides access to information that helps them deepen their knowledge of their own ethnic culture and heritage and achieve greater opportunities to participate in an ever-shrinking, highly interdependent global community.

Challenges in HL Literacy Development

While intergenerational transmission of HL oral skills in general is difficult for most language-minority groups (Campbell & Christian, 2003), the transmission of HL literacy is even more challenging. Because HL maintenance begins in the home, children from families where the parents are not literate or are from linguistic backgrounds with strong oral traditions, such as the Hmong or some indigenous cultures, have few or no opportunities to develop literacy skills. Even in homes from cultures that place heavy emphasis on literacy practices, parents who generally do not have training in literacy instruction report they experience limitations in what they can teach their children. In addition, access to HL print materials in homes, as well as in public venues such as libraries, is limited, despite its importance for literacy development. Guardado (2002) found that the physical presence of children's books and wall prints in Spanish, as well as tapes of Spanish songs, in Spanish-heritage learners' homes was critical in developing literacy competence. Hence, resources and policies that can increase the availability of various print materials in different languages are sorely needed.

Another persistent challenge has been to develop effective curricula and instructional strategies for literacy instruction that can meet the needs of HL speakers. The development of appropriate teaching resources has been especially difficult due to the great diversity of characteristics among these speakers. Efforts are under way to develop, implement, and test various pedagogical approaches, including those with a focus on basic literacy skills, topics-based instruction, and skills-based tactics, but these methods have been implemented with differing degrees of success with HL speakers. While the range of unique characteristics that define HL speakers is still under debate, there are some common characteristics shared by most HL speakers that can offer partial guidance for approaching HL literacy instruction.

For example, for most HL speakers who are literate in English, basic literacy skills and concepts are likely to transfer and serve as a resource in developing their HL literacy (Cummins, 1981). However, because HL speakers may have never been exposed to HL

print, instruction may have to begin with basic literacy concepts that are unique to the language, including the directionality of text (e.g., left to right, right to left, top to bottom) or recognition of the writing symbols, particularly for HL speakers of non-alphabetic languages. In addition, it is important that learners understand that stylistic norms may differ between genres in their HL and in English, and thus instruction needs to target development of an awareness of which aspects of language use can be transferred between languages.

HL speakers generally have minimal formal training in their HL: They tend to write the way they speak. In such cases, Chevalier (2004) recommends that HL speakers are likely to benefit from curricula that involve an examination of what distinguishes spoken discourse from written discourse. HL speakers need to receive explicit instruction on written discourse strategies for formulating complex sentences that go beyond simple, conversational discourse, or logically organizing and connecting ideas and expressions in a socio-culturally appropriate manner. In order to do so, HL speakers must expand their repertoire of vocabulary and expressions that extend beyond the family to academic and social domains as well as to grammatical and rhetorical devices that connect ideas in a clear manner.

Moreover, many HL speakers tend to share a lack of familiarity with the full range of stylistic registers available to the educated native speaker, because they acquire their parents' dialect rather than the standard dialect prescribed in schools. Instructors need to help students become aware of which HL dialect they speak and how it relates to what is considered standard in their HL culture, since written discourse conventions are mainly based on standard dialects. Furthermore, it is not uncommon that the language of HL speakers conveys features that differ from the language of the native speakers in the homeland, as well as the language of their parents' generation. Most notably, their language contains errors because their proficiency has not fully developed. Another characteristic is that HL speakers often mix their HL and English in the form of code switching (i.e., the use of more than one language, variety, or style by a speaker within a sentence or conversation, or between different speakers or situations) for both linguistic and pragmatic reasons. Continuous contact with English (e.g., the relationship between English and HL proficiency, the influence of English literacy on HL literacy activities, and the differences between students' formal schooling in English and in the HL), natural changes in language use that reflect the changing culture, and intergenerational language shifts all seem to contribute to the uniqueness of the HL and its use. Thus, HL instruction needs to take these factors into consideration and support speakers in recognizing how their ways of using their HL may differ from the prescribed ways of literacy practices for the native speakers of the language.

Opportunities for HL Literacy Development

Opportunities to use HL literacy are critical in supporting the role of literacy in HL maintenance. Advancements in technology and the Internet hold significant promise to raise awareness of the need for HL literacy skills and increase the opportunities to practice using them. HL speakers can view periodicals, navigate through Web sites in their HL, or download TV or radio shows from their homeland. According to Villa (2002, p. 97), however, "computers cannot become a surrogate for one generation of minority language speakers passing that tongue to subsequent generations." Lee (2006) found that electronic literacy practices enabled HL speakers to create social networks with other heritage and native speakers, allowing them to practice and use their HL literacy skills for authentic purposes. The flexibility and creative means of expression (e.g., abbreviations, phonetic spellings,

use of symbols, nonstandard use of grammar) commonly found in electronic literacy practices also lowered their inhibitions about writing in their HL. In other words, the lack of perceived pressure to produce correct spelling and forms of HL online gave HL speakers the confidence and space to experiment with and engage in literacy practices. Thus, taking up opportunities to engage with other native speakers of their HL online not only reinforced their language skills, but also provided them with the motivation to continue using and developing those language skills.

Clearly, increasing opportunities for exposure to literacy activities are critical to HL development, but the realization of why literacy skills are needed is just as important because it results in stronger motivation to develop those skills. Studies have shown that one of the greatest barriers against achieving HL proficiency is students' lack of motivation to see its relevance and need in a US context, where the acquisition of English is sufficient (Lee, 2002; Shin, 2005). For example, enrollments in Chinese HL schools in southern California significantly increased once students could receive foreign-language credit from their local public schools for studying Chinese at HL schools. Similarly, enrollments in Korean classes increased once Korean was established as an elective for the SAT II test. Such changes in educational policies make it possible for students to see their HL as a legitimate and valued entity, and hence motivate them to maintain and develop their HL and literacy skills. Yet another motivating factor for the generation of HL speakers is the appeal of popular cultural activities in their social lives. Engagement with ethnic TV soap operas, karaoke singing practices in ethnic cultures, and social network sites, such as www.hi5.com in Spanish and www.cyworld.com in Korean, offer exposure to HL cultures and customs, in addition to providing genuine opportunities for HL speakers to make use of their literacy skills. Therefore, making appropriate forms of ethnic media more readily available to youth can also provide a supportive mechanism for HL maintenance (Lao & Lee, 2009).

In sum, HL literacy maintenance is a basic right and a prerequisite for global citizenship. It is a tie that not only connects HL speakers to their family, community, and traditional cultural practices, but also bridges them to changing trends, values, practices, and language use within their communities.

Literacy and Language Revitalization

TERESA L. MCCARTY

To revitalize a language is to create new contexts for its acquisition and use among a heritage community associated with that language. The goal is to engender new vitality in a language that is in danger of falling silent because natural intergenerational language transmission mechanisms have broken down, causing the language to fall out of everyday use. Endangered languages are described as “at risk” or “moribund,” meaning their speakers are beyond childbearing age, or as “sleeping” or “dormant,” meaning they have no native speakers but have written and/or audio documentation and a living heritage community. Language regeneration, renewal, and reclamation are overarching terms to describe revitalization processes for endangered languages.

Print literacy is one means of revitalizing a language, although it is not the only or even the principal means and in some cases is not desired by the heritage language community. Among many Indigenous communities, for example, oral tradition is viewed as the prime carrier of the Indigenous culture, and revitalization often focuses on strengthening oral language among younger generations rather than the promotion of print literacy. Moreover, to the extent that print literacy is associated with schooling, it introduces into the revitalization situation a host of additional considerations, including the historic role of schools in the community and biases that favor teaching the dominant tongue (for a discussion, see Grenoble & Whaley, 2006, chap. 5; for cases of school-based language revitalization, see Francis & Reyhner, 2002; Hornberger, 2008). Thus the relationship between literacy and language revitalization is complex and contested, calling into question the forms of literacy present in a given heritage language community, the perceived status and utility of those languages and literacies, the role of schools and their medium-of-instruction policies as language planning agents, issues of dialect difference and standardization, and the community’s self-determined language planning goals.

Understanding these complexities requires recognizing the asymmetrical power relations that place languages at risk of losing their speakers in the first place. According to some projections, 90% of the world’s 6,900 languages are likely to be displaced by dominating languages by century’s end. Most of the “lost” languages will be Indigenous languages, but they are not alone: Irish, Welsh, Frisian, Yiddish, Cornish, and a host of minoritized mother tongues face uncertain futures. Why are these languages losing their speakers? The fate of a language is intimately tied to that of its speakers and therefore to power relations manifest in social practices and policies that diminish the status and utility of some languages while elevating others. Skutnabb-Kangas (2000) refers to this as linguistic genocide or “linguicide.” State-sponsored schooling and medium-of-instruction policies have been prime instruments of linguistic genocide, but as this entry describes, schools have also become strategic sites for language revitalization, especially when they are under minority-community control.

It is evident then that the role of literacy in ameliorating language loss is inherently political and ideological. In keeping with research in the new literacy studies (Street, 2008), literacy is understood to be socially and historically situated, fluid, multiple, and power-linked. This orientation does not ignore the psycholinguistic, cognitive, or technical aspects of literacy, but rather embeds them within relevant sociocultural contexts, recognizing that

literacy learning is both enabled and constrained by power relations within the larger society.

Literacy Practices and Policies for Language Revitalization

With these foundational understandings in place, language revitalization and literacy practices and policies in support of it can be examined as a subset of goals and activities under the larger rubric of language planning and policy (LPP). As a field of study and social practice, LPP includes three key activities:

- status planning—the planned use of particular languages for certain purposes in certain domains (e.g., education, the courts, public services, the media, cultural activities);
- corpus planning—decisions about linguistic norms and forms (e.g., the creation of writing systems, issues of standardization and terminological modernization);
- acquisition planning—decisions about who will acquire the language and how (e.g., the promotion of a language in school, the workplace, etc.). (Kaplan & Baldauf, 1997)

It is important to recognize that these activities are not discrete, nor do they take place in a linear, lock-step fashion. Each LPP activity presupposes, interacts with, and implicates the others. Consider, for example, Welsh-language literacy in Wales. A language with a long and widely heralded literary tradition (Welsh legal treatises date to the 11th century CE and Welsh-language poetry has long enjoyed international prestige), the number of native speakers of Welsh declined sharply over the past century. As with other endangered languages, the causes for the decline are rooted in colonization, urbanization, out-migration, and an influx of speakers of the dominant language—in this case, English. By the late 20th century, only 20% of the population of Wales identified as Welsh-speaking. In response, the Welsh Language Act was passed in 1993, stipulating equal treatment for Welsh and English in all public institutions. According to Welsh-language scholar Colin Baker (2003), this means that “Welsh should be used in all domains” (p. 86). The Act is part of a larger Welsh normalization movement (*nomaleiddio*)—status planning aimed at making bi/multilingualism the rule rather than the exception. Schools are required to offer Welsh as a first or second language from ages 5 to 16 (acquisition planning), and Welsh-language literacy is a core curricular component from preschool to vocational and higher education (Martin-Jones, 2011). Welsh-medium schooling and literacy development are intended to elevate the status of Welsh vis-à-vis English while building the material and human resources to promote its use “in all domains.”

The cases of Hawaiian and Māori, both Polynesian languages, offer insights into these processes from two of the most successful Indigenous language revitalization movements in the world. Following the expeditions of Captain James Cook in the late 18th century, Hawaii and Aotearoa/New Zealand were drawn into an international trade and political network. (Aotearoa is the Indigenous Māori term for Māori territory, subsequently named New Zealand by the British.) In Hawaii an Indigenous monarchy emerged, with Hawaiian as the language of government, business, trade, education, religion, print media, and intercultural communication. By 1893, when the USA staged an illegal military takeover of the Hawaiian Kingdom, the Hawaiian literacy rate was higher than in any other language used in the Hawaiian islands (Wilson & Kamanā, 2006). During this same time period, Aotearoa/New Zealand was being colonized by the British, who imposed a harsh assimilationist policy. The years that followed saw both Hawaiians and Māoris dispossessed of

their lands, homes, and treasured possessions by White colonizers. In both cases, by the mid-20th century, language death was imminent (Wilson, 1999; May, 2004).

These events motivated coterminous language and culture revitalization movements. In 1978, Hawaiian was recognized as co-official with English in the state of Hawaii. In 1987, the Māori Language Act was passed, designating Māori as co-official with English. (In 2006, New Zealand Sign Language was also recognized as a co-official language in New Zealand.) Full-immersion Māori and Hawaiian “language nests,” called *Te Kōhanga Reo* and *Aha Pūnana Leo*, respectively, began in the early 1980s. These family-run preschools allow for communicative interaction between children and fluent native speakers entirely in the Indigenous language, with the goal of cultivating knowledge of the Indigenous language and culture as they were formerly learned from parents and extended family members at home.

Educational ethnographers Richard Hill and Stephen May (2011) provide an account of Māori-English biliteracy learning at Te Wharekura o Rakaumangamanga (Rakaumanga) School, one the largest and longest-running Māori-medium schools in New Zealand. Rakaumanga offers Māori-medium schooling for students from year 1 (age 5) to year 13 (age 18). Following Spolsky’s (2005) “seven-year Māori immersion principle” (the length of time research shows is necessary to develop full academic proficiency in a second language), entering students must have attended Kōhanga Reo for at least two years, laying the foundation for four years of full Māori immersion, after which English is introduced for three to four hours per week. To ensure integrity of the Māori-language environment, Māori and English instruction are separated by time, place, and teacher. The goal is for students to develop full bilingualism and biliteracy as a means of preparing them for full citizenship in their natal community and to become “citizens of the world” (Hill & May, 2011).

To assess reading in Māori, Rakaumanga uses a Māori-language framework in which each reading level (called a *kete*, a traditional woven flax bag named for a Māori plant) is arranged according to difficulty. Māori writing is also assessed using nonfiction Māori texts. According to Hill and May, these literacy assessments show that by year 8, students have reached or are approaching age-appropriate literacy development in both languages and are “well on their way to achieving the goal of bilingualism and biliteracy, a key aim of Māori-medium education” (2011, p. 178). Research by Māori educator Cath Rau (2005) extends these findings to other Māori-medium schools. The academic benefits, Rau notes, are the result of increased support and resources for Māori curriculum development (corpus planning) and teachers’ professional development (acquisition planning). Thus there is strong evidence that Māori-medium schooling—in particular the sustained development of biliteracy—promotes both academic achievement and language revitalization.

Increasingly, information technology plays a central role in these language and literacy planning processes. Coronel-Molina and McCarty (2011) examined the role of digital literacies for Quechua in South America. With 8 to 12 million speakers in six South American countries, Quechua (called Quichua in Ecuador) is nevertheless endangered as a consequence of more than five centuries of linguistic and cultural oppression and the continued marginalization of its speakers. Over the past four decades, a region-wide Indigenous resurgence has led to national policies mandating bilingual-intercultural education and designating Quechua as co-official in Peru and Bolivia and Quichua as co-official in Ecuador. Audiovisual and video resources now provide opportunities for language learning in authentic cultural contexts; multimedia DVD, Internet resources, and interactive textbooks complement hard-copy texts. Online Quechua dictionaries, glossaries, and Native-language interfaces with popular computer programs such as Windows have been developed, and Google has a search engine in Quechua. These new forms of literacy both reflect and construct new language-learning opportunities while enabling “Indigenous languages to take their rightful place in the contemporary world” (Coronel-Molina & McCarty, 2011, p. 367).

Literacy Planning Challenges for Endangered-Language Communities

None of these LPP efforts is without problems and challenges. In the case of information technology, access is a major obstacle, a function of the geographic isolation of many endangered-language communities and of profound social and economic inequities. Corpus planning is often fraught with conflict. Such has been the case for Quechua and Quichua in Peru and Ecuador, where debates surrounding the number of vowel phonemes represented in the language's written form (three) versus those pronounced in speech (five) have hampered language revitalization. As Hornberger and King (1999) point out, these corpus planning debates veil larger issues of Indigenous self-determination and who has the right to control linguistic and cultural futures. In Ecuador, *Quichua Unificado* (unified Quichua) was developed to encourage Quichua literacy and revitalization. As King (2001) explains in the case of Saraguros in southern Ecuador, the difficulty is that Quichua Unificado and *Quichua Auténtico* (authentic Quichua) have been pitted against each other. Educated, economically successful Saraguros tend to speak the Unified Quichua learned as a second language in school, while older, less educated and more rural Sarguros speak the "authentic" variety as a first language. Paradoxically, authentic Quichua is viewed by users of Unified Quichua as "impure" because it includes Spanish loan words. The Quichua situation mirrors one described by Jaffe (2011) for Corsican, where competing demands of formal linguistic authority, including the demand for uniformity and the exclusion of French, challenge the everyday language practices of Corsican speakers, which incorporate French-origin terms.

Native Hawaiian scholars Sam No'eu Warner (1999) and K. Laiana Wong (1999, 2011) analyze similar issues for Hawaiian, arguing that the responsibility (*kuleana*) for Indigenous language revitalization and its representation in written form lies with members of the heritage language community themselves. Addressing these challenges for Welsh, Baker (2003) notes the propensity for language and literacy planning to reflect models established for the dominant tongue. The National Curriculum for Welsh and English literacy, for instance, is "highly functional, about technical skills, decoding symbols, correctness and accuracy," emphasizing "linguistics rather than communication, legitimacy rather than diversity" (Baker, 2003, pp. 79–80). Baker proposes transliteracy as a pedagogical strategy in which students "read and discuss a topic in one language, and then . . . write about it in another" (2003, p. 83). This facilitates conceptual reprocessing (an acquisition planning goal) while valorizing Welsh as an academically empowering medium of instruction (a status planning goal).

These issues of authenticity, authority, legitimacy, and identity are central to language revitalization processes and prospects. Especially contentious are the kinds of literacies valued and cultivated in and out of school. As Jaffe (2011) observes for Corsican-language education policy, teachers' practices are shaped by the school's emphasis on a single legitimate linguistic code. In ethnographic research on bilingual vocational education in Wales, Martin-Jones (2011) further illuminates the differences between young adults' in- and out-of-college literacies, noting that the range of texts and genres used and produced in their college classes is much more narrow than that of their everyday worlds of work. Like Baker, Martin-Jones advocates for meaning-centered biliteracy pedagogies that are "purposeful, interactive, and multimodal, like the students' out-of-college literacy practices" (2011, p. 249). Particularly in settings where revitalization is a goal, "we must surely pay attention to the ways in which new kinds of texts and new genres are employed and assigned value," Martin-Jones cautions (2011, p. 250).

The Multiple Roles of Literacy in Language Revitalization

If the aim of language revitalization is to produce new speakers, then literacy development alone is insufficient to achieve that goal. As Fishman notes in his classic (1991) treatise, *Reversing Language Shift*, orality cultivated in the context of family and community is the *sine qua non* of intergenerational language continuity. Literacy can nevertheless play a crucial role in supporting home-based revitalization and opening new language-acquisition pathways. In a study of Indigenous-language literacy among the Hualapai of the southwestern USA, Watahomigie and McCarty (1996) show that literacy in Hualapai, though confined primarily to the school, serves to affirm Indigenous identities, assert local education control, and provide a “pro-Hualapai” bridge to the dominant language and the wider society. Further, by elevating the language’s status among a community of users, literacy can foster use of the heritage language in out-of-school domains such as local media and government. This creates new contexts for natural communication in the heritage language between older and younger generations. And, as Salinas Pedraza (1996) observes for Indigenous languages in Mexico, writing an endangered language can help “recapture and nurture the cultural, scientific, and technical traditions” of the people associated with the language (p. 184). The Māori and Hawaiian cases attest to the clear academic benefits of bi/multiliteracy in an endangered language as well.

Finally, it should be noted that historic literacies have been instrumental in bringing “sleeping” languages back to life. In this regard the case of Wôpanâak is instructive. An Algonquian language spoken by peoples Indigenous to what is now the northeastern USA, the last native speaker of Wôpanâak (also called Massachusett or Wampanoag) died in 1908. Fortunately, Wôpanâak has a significant corpus of written texts, including lexicons, letters, diaries written by native speakers, and the 1663 Eliot Bible, the first Bible to be translated into a Native North American language. These resources have enabled the Wampanoag to formulate a dictionary and language curriculum to teach Wôpanâak to community members (Ash, Fermino, & Hale, 2001). Miami linguist Wesley Leonard (2008) describes a similar process for another Algonquian language, Miami-Illinois, whose last fluent speaker died in the 1960s. Although Miami lacks audio documentation, its written documentation is extensive, including a 17th-century dictionary discovered in 1999. This and other historic texts have enabled the Myaamia Project, an initiative of the Miami Nation of Oklahoma and Miami University of Ohio, to produce a corpus of contemporary language-learning and teaching materials. The case of Miami, Leonard (2008) writes, offers “real hope to other communities whose language situations appear bleak” (p. 26).

In sum, literacy can widen the possibilities for revitalizing a language but it can constrain those possibilities as well. Literacy’s potential as an agent of language revitalization lies in its activation by the heritage-language community itself. Evidence from research and practice shows that this can best be realized by the cultivation of multiliteracies for multi-purposes across multidomains.

Literacy and Multicultural Education

ENID M. ROSARIO-RAMOS AND SONIA NIETO

Early Developments

Multicultural education has always been concerned with furthering social justice and providing children with a relevant and rigorous education. This concern involves an understanding and appreciation of diversity, the examination of power structures and relationships, a close look at the ideological underpinnings in the construction of knowledge, and the development of culturally responsive pedagogy. Even though we recognize that multicultural education has addressed a broad range of issues related to social justice and education, in this entry we will focus on the links between literacy and multicultural education.

Literacy and multicultural education have been closely linked since the early 1970s when the multicultural education movement began, first in the United States and shortly thereafter in other nations (Banks, 2009). Even before then, however, the goals of diversity and literacy were evident in late-19th- and early-20th-century African American intellectual thought in the work of such scholars as Du Bois (1935) and Woodson (1933). During slavery, which in the United States did not end until 1865, teaching enslaved Africans to read was a crime punishable by law. Thus, intellectuals such as Du Bois and Woodson, among others, viewed literacy as fundamental to social, political, and economic equality. Their work laid the foundation for the Civil Rights Movement of the 1950s, which considered literacy to be a tool for individual and community empowerment and development. According to Clark, one of the leaders of the Civil Rights Movement who was especially committed to education, "Literacy means liberation" (2004, p. 303), both in the sense of fighting illiteracy and in the broader sense of being educated for citizenship.

Scholars from other racial and ethnic groups were also significant players in linking diversity issues with literacy before the advent of multicultural education. For instance, scholar and educator Sanchez (1940) was a leading voice in the struggle against unequal and segregated schools for Mexican Americans. In New York, Antonia Pantoja and other Puerto Rican leaders advocated equal education beginning in the 1950s and in the 1960s they founded *Aspira*, an educational organization that provides counseling, college preparation, and other support services for Latino youths. Other groups including Chinese and Japanese Americans, primarily in California but in other states as well, and Native Americans, primarily in the West, waged struggles for equal education (Lomawaima, 2004; Pang, Kiang, & Pak, 2004).

Native-language maintenance has always been part of a progressive view of literacy. This is not surprising given the systematic annihilation of native languages other than English in US history (Spring, 2009). Two examples suffice: Enslaved Africans were stripped of their native languages through policies that enforced an English-only approach as a means of social control. Numerous languages were lost because of this policy. Another brutal attempt to obliterate native languages was the case of Native Americans whose children were forcibly removed from their homes and placed in boarding schools where they were prohibited from speaking their native languages and assimilated to US mainstream ways (Archuleta, Child, & Lomawaima, 2000).

Major Contributions

As defined in the early years of the development of the field of multicultural education in the 1970s, the primary focus was race and ethnicity, and especially the education of African American students. Given its roots in African American intellectual thought and the Civil Rights Movement, this is not surprising. Nevertheless, although language concerns were not initially a major part of multicultural education, by the 1980s most scholars in the field were acknowledging the importance of language issues and literacy (Nieto, 2001). This is because native languages other than English, bilingualism, bidialectism, and other language issues—in the same way as ethnicity, race, and other differences—have often been perceived as problems rather than as assets, both in school settings and in society at large. In addition, with the dramatically increasing number of immigrant and non-English-speaking students in US schools, it became clear that teachers needed to learn to teach children for whom English was an additional language. Moreover, language-minority and immigrant students frequently live in poverty, joining their African American peers as the most marginalized and underserved students in the public schools. As a result, scholars began to address language differences and literacy as a significant concern in multicultural education (Nieto, 2001).

The concern with language as a key component of multicultural education can best be seen in two areas: bilingual education and critical pedagogy or critical literacy.

Bilingual Education

Even in the early battles for racial desegregation, language-minority communities were adamant that respect for their native language needed to be a primary consideration in the education of their children. By the 1960s, calls for bilingual education became a growing concern in the Civil Rights Movement as defined by Latinos, Native Americans, and other language-minority groups (Crawford, 2000). The first modern successful court case involving language rights and education was filed on behalf of Chinese immigrant children in San Francisco. That lawsuit resulted in the landmark *Lau v. Nichols* (1974) decision by the United States Supreme Court that famously declared,

There is no equality of treatment merely by providing students with the same facilities, textbooks, teachers, and curriculum; for students who do not understand English are effectively foreclosed from any meaningful education. Basic skills are at the very core of what these public schools teach. Imposition of a requirement that, before a child can effectively participate in the educational program he must already have acquired those basic skills is to make a mockery of public education.

The *Lau v. Nichols* decision laid the groundwork for advances in bilingual education during the 1970s and beyond. In addition, the Equal Educational Opportunities Act (EEOA) of 1974 was also significant in protecting the rights of language-minority students. This law maintained that any educational agency that failed to “take appropriate action to overcome language barriers” was in fact denying students an equal education (EEOA, 1974). As a result of these legal supports, hundreds of school systems throughout the nation began to offer bilingual programs with two major components: native-language instruction and ESL (English as a second language). Sometimes, a cultural component was also an important part of bilingual education.

Although bilingual education has proven to be generally more effective in teaching English than other approaches (ESL alone, immersion, or “sink-or-swim” approaches in which students are placed in regular English-language classrooms to fend for themselves), it has been controversial from its very inception. That bilingual approaches to learning

English have been at least as effective as structured English immersion (SEI) has been validated through many studies (August & Shanahan, 2006). Nevertheless, it continues to be a contentious debate because the use of languages other than English for instruction has sometimes been seen as un-American and unpatriotic. Thus, the argument has often been framed more as a political than as a pedagogical one.

Critical Literacy

Another significant link between language and multicultural education emerged with the field of critical literacy. Too often and for too long, language-minority children have been marginalized in schools and society through the naturalization of epistemological beliefs and instructional practices that privilege white middle-class ways of being (Nieto, 1994). A literacy education that aims at equality requires that the life experiences of minoritized children and their families be integrated into the fabric of classroom practices and that students, who now live in a linguistically diverse and globally interconnected society, become committed citizens who are able to understand the societal structures in which they reside and who are willing to work toward a more just society.

Literacy education can become a space of possibility if young people enter classrooms that represent safe spaces for the discussion of diverse ideas and models of the world. This includes an expansion of the range of texts that are included in the curriculum, a reexamination of our definitions of what content is worthy of study in literacy classrooms, and the development of flexible instructional practices that address the needs of children from different backgrounds.

Recent research has shown how providing students with opportunities to challenge traditional views of what counts as literacy as well as opportunities to delve into the study of texts that are relevant to their communities can lead to an empowering experience. These opportunities support not just a rigorous examination of texts, but also the study of societal structures that privilege some groups over others. This rigorous examination of textual representations of social inequalities is necessary for the children's development as active citizens (Freire, 1970). Examples of these pedagogies are found in the use of popular- and youth-culture texts as academic texts (Morrell, 2002), the inclusion of multicultural literature into the language arts curriculum (Souto-Manning, 2009), the critical examination of everyday texts such as catalogues and government forms (Luke, O'Brien, & Comber, 2001), and the engagement of students in the production of personal and culturally relevant texts (Jocson, 2006). These empowering literacy practices are instrumental to students' academic and intellectual development but also to their development as conscious citizens in a diverse society.

Problems and Difficulties

The value of multicultural education, particularly for the academic success of minoritized children, has not always been clear. Consequently, multicultural education in the United States has mirrored the history of the struggle for equity and social justice in education. As such, it has been controversial and has been subject to criticism from both the left and the right since its beginnings (Sleeter, 2001). A major critique is that multicultural education is not much more than a celebratory and "feel-good" pedagogy that contains little substance in academic terms or in its potential for changing the life chances of marginalized students. These critics show a lack of understanding of the central role that identity plays in the learning process and the importance of culturally relevant pedagogy for students' engagement with schooling. Additionally, most critiques have been from the right, and they have often been made by scholars who know little about the field and who focus not

4 LITERACY AND MULTICULTURAL EDUCATION

on recognized scholars in the field but on those on the fringe. Their arguments stress such fears as the disappearance of the American canon, or the threat to the common American culture by a focus on differences rather than on similarities (Bloom, 1989).

Another controversy has centered on who should be included under the umbrella of multicultural education. In the recent past, most scholars in the field have broadened their conception of the field to include not only race and ethnicity, but also language, gender, sexual orientation, ability, and other issues. Nevertheless, other scholars believe that this broad inclusion diminishes the original intent of multicultural education, which was to equalize educational opportunity for students marginalized by their race and ethnicity (Gay, 2003).

A more substantive criticism is that the field has been undertheorized, leading to a utopian and uncritical view of change and a static conception of culture and identity (Dolby, 2000). Given the tremendous hybridization of youth culture, as well as a growing globalization and international immigration, this is an important critique that needs to be heeded. The lack of analysis of institutionalized systems of oppression has been yet another criticism of the field. That is, the foundation of some conceptions of multicultural education has been a psychological one rather than a systemic one, thus seemingly promising change in spite of brutal institutional barriers that get in the way of equal education and more liberatory conceptions of education. However, although it is true that classroom practice has often been superficial, focusing on a “holidays and heroes” approach, most serious scholars in the field have grappled with the issues of institutionalized power and oppression for many years (see Nieto, Bode, Kang, & Raible, 2008).

Given the recent standardization and accountability movements, multicultural education, bilingual education, critical literacy, and other progressive approaches to education have come under even greater scrutiny. The laser-like focus on test preparation and test scores has meant that those subject areas (such as the arts) and approaches (such as multicultural education) that seem to detract from obtaining high scores have been abandoned (Au, 2009). Furthermore, in the United States and other industrialized nations, the tremendous growth in immigration has led to a backlash against such progressive approaches as multicultural education and critical literacy.

Recent Developments

As discussed above, early developments in the multicultural-education scholarship have highlighted the importance of attending to the need for education that works toward social justice. Developments in the area of critical literacy and bilingual education offer compelling examples of efforts to provide students, especially minority students, with a literacy education that is empowering and liberatory.

Immigration processes have created new configurations of communities across the United States (Suárez-Orozco & Suárez-Orozco, 2009). As the increasing cultural and linguistic diversity of the United States’ population and communities across the globe becomes ever more evident, multicultural education turns out to be increasingly relevant. These concerns about diversity are paired with a need to develop more equitable educational practices that eliminate current educational disparities between mainstream and minority groups of students. The presence of diverse groups of students in our classrooms requires educators who are committed to rethinking traditional educational canons and to developing new ways to provide quality education for students from multiple backgrounds.

The development and expansion of digital communication technologies have extended the discussions about diversity beyond national boundaries and into a global sphere where people and information are in constant flow, where relationships are built and maintained

across nations, and where the spaces for learning are no longer concentrated within the local space of a classroom. Young people are increasingly becoming participants in a globalized society where texts, images, and relationships are readily available through digitally mediated communication technologies.

Literacy researchers have pointed to the importance of attending to these new ways of literacy engagement and development where multiple cultural productions are constantly accessed and produced by young people beyond local spaces. This expansion of the scope of literacy forces literacy educators and researchers to reevaluate their definitions of literacy and literacy learning as well as their ideas about the role of literacy in modern life. The New London Group (1996) stresses the significance of paying attention to the emergence of new literacy practices that are now multimodal, multilingual, and multicultural.

The children of immigrant families seem to be at the forefront of these new movements. These children often navigate multiple geographical boundaries using digital communication technologies as they access cultural productions from their sending countries at the same time as they develop expertise in the literacy practices of their host countries and beyond (Lam & Rosario-Ramos, 2009).

The impact of digitally mediated communication technologies brings new dimensions to our discussions of diversity and multiculturalism, especially when people around the world are constantly interacting with each other and exchanging material and cultural goods. Furthermore, as young people become increasingly interested and participant in these global spaces, educators need to attend to the cross-boundary learning that happens in these spaces as they might yield interesting insights and ideas about how to best educate this highly diverse global generation.

Future Directions

In the United States in the era of No Child Left Behind, immigration debates, and a new discourse of postracial America, issues of diversity and multiculturalism are at the center of the education debate. A recent article in *The New York Times* (Rich, 2009) discussed new approaches to literacy learning where teachers provide their students with ample freedom in choosing the texts they want to study. This approach has been met with resistance from supporters of the maintenance of traditional literary canons that dictate which texts students should know and be able to discuss. The debate brings to light longstanding beliefs about what counts as literacy and raises questions about who gets to decide what is worthy of academic consideration and which communities are represented in traditional canons. At a time when diversity is difficult to ignore as people move across national borders and the expansion of communication technologies puts us in contact with the world, one has to question whether traditional views on literacy education still make sense. As our students increasingly come from diverse backgrounds and live and grow in a more interconnected and interdependent world, multiculturalism is not only relevant, but also crucial to a more equitable literacy education.

Literacy and Transnational Migration

BRAD L. TEAGUE AND ROBERT T. JIMÉNEZ

The relationship of literacy to transnationalism and immigration is not immediately obvious. On one hand, a seemingly endless series of reports informs us of the low academic achievement, especially in terms of English literacy, for students for whom English is an additional or new language (Lee, Grigg, & Donahue, 2007; Pew Hispanic Center, 2008). On the other hand, we know that these students bring lived experiences to the task of schooling that are not well understood; nor are these experiences incorporated into curriculum, instruction, or assessments in ways that validate these young people, acknowledge their linguistic and cultural strengths, or help them to access the mainstream curriculum for purposes of social mobility (Lee, 2007; Working Group on ELL Policy, 2009). As is well known, the numbers of these students, typically referred to as English language learners (ELLs), has increased dramatically over the past few decades. To cite some statistics, recent estimates place the total number of foreign-born individuals in the US at around 33.5 million, or about 12% of the total population (Larsen, 2004). Moreover, the children of immigrants constitute around 20% of the K–12 student population, and this number is projected to more than double within the next 20 years (American Association of Colleges for Teacher Education, 2002).

One intriguing domain of activity that might have implications for English literacy instruction involves the transnational, or cross-border, practices engaged in by many youths from immigrant backgrounds. These practices connect them to their countries of origin as well as many other geographic locations, and they very often involve reading, writing, designing, and other activities that are saturated with the desire to communicate, or semi-otic intent. Examples include the sending of remittances, as well as phone, e-mail, texting, and chat conversations with family members and friends, and the sending and receiving of videos. Participation in these practices affects numerous areas of students' lives, including, for our purposes, their learning and use of different forms of language and literacy. In addition, by foregrounding this facet of these students' behavior, we move away from what they do not yet know and what they cannot yet do to a more desirable distinguishing feature, that of transnationalism. This entry describes and illustrates the emergence of "transnational literacies" (Jiménez, Smith, & Teague, 2009) and discusses specific ways in which these literacies can be capitalized on to increase the school success of students from immigrant households. While researchers have drawn on a variety of perspectives to describe the language and literacy learning of immigrant children (see Lam, 2006), this entry draws on an emerging framework that highlights their mobility as well as the multiple identities, languages, and literacies that often result from their transnational affiliations. In particular, engagement in cross-border practices has the potential to extend the multilingual literacy resources available to immigrant youth, and thus the relationship between transnationalism and literacy merits closer examination.

The entry is organized as follows. First, it defines how the terms "transnationalism" and "literacy" are used, and then reviews a number of recent empirical studies that frame literacy learning and use within the context of transnational flows. Next it presents and discusses a vignette that depicts in concrete fashion what transnational literacy looks like within the life experience of a "typical" youth. In this vignette, examples from many different young people are bundled together within a composite case. The final section draws

on these examples—as well as those mentioned in the literature—to make a case for why the school success of immigrant students (and others) would be greatly enhanced if educators not only recognized these kinds of text but also actively integrated them into their instruction.

Transnationalism, Literacy, and Transnational Literacies

Transnationalism refers to the movement of people, information, language, and goods between nations. Importantly, transnational flows or practices are both bidirectional and sustained over time (Portes, Guarnizo, & Landolt, 1999) and are linked to complex processes of globalization. To give an example, globalization, or the integration of world economies, has resulted in the production and sale of cheap corn in the US. This development, in turn, has eliminated jobs for large numbers of farmers and their families living in Mexico and Central America. Consequently, many of these individuals have immigrated to the US in an attempt to secure employment in the same area. Interestingly to us, these individuals are likely coming into contact with and acquiring new forms of language and literacy that they may then share with friends and family members in their places of origin. Such is especially true for their children, who may grow up in the US but still maintain ties to individuals in Mexico or Central America. As this example illustrates, globalization often creates the conditions under which transnational behaviors and practices flourish. Transnationalism, then, is the social process in which individuals develop and maintain “multiple relations” that link their countries of origin and settlement (Schiller, Basch, & Blanc-Szanton, 1992). Hornberger (2007) distinguishes transnationalism from immigration by pointing out that while immigration typically involves “permanent affiliation with the host country and separation from the home country,” transnationalism implies maintaining ties to the country of origin as well as the possibility that one may eventually return (p. 326).

Levitt and Schiller (2004) propose the notion of the “transnational social field” as an elaboration upon the idea of social field. The transnational social field ignores national boundaries in a deliberate attempt to create and link networks for the purpose of making resources, practices, and ideas available to its members. Significantly, it is within these spaces that individuals “take actions, make decisions, and develop subjectivities and identities” (Lam & Rosario-Ramos, 2009, p. 173). Due to the increased availability of technology and digital forms of communication, binational flows of cultural and symbolic materials have rapidly accelerated and such movements play a major role in shaping the daily lives of those who participate in them. In other words, global and transnational processes directly impact the lives of immigrants engaged in cross-border practices. For example, individuals involved in transnational flows may raise and send money to families and home communities, exchange new ideas (Cohen, 2004), engage in religious celebrations and other events organized in the host country, send media and donations across borders (Smith, 2005), and participate in ongoing e-mail communication (Farr, 2006).

By definition, many immigrants develop hybrid or mixed identities that place them in a position of “other” with respect to both their home countries and their host countries (Trueba, 2004). As mentioned previously, this existence allows them to engage in various social fields within both physical and cyberspace that work together to influence their beliefs, values, and actions. This is important because studies of immigrant youth, including their language and literacy practices, must necessarily take into account their participation in multiple worlds. Interestingly, researchers have claimed that individuals who engage in transnational flows often develop “dual frames of reference” that allow them to compare “experiences and opportunities in the two settings” (Suárez-Orozco & Suárez-Orozco, 2001,

p. 114). Vertovec (2004) terms this process “bifocality” and argues that “transnational forms of exchanges, communication, and activities impact upon the cognitive, social, and cultural orientation of migrants” (cited in Lam & Rosario-Ramos, 2009, p. 174). García Canclini (2001) proposes that individuals living on the US–Mexican border develop identities that are “polyglot and cosmopolitan, endowed with a flexible capacity to process new information and understand habits that are different from those of their original symbolic matrices” (p. 144). In other words, these people develop a keen sensitivity concerning national identity, cultural difference, and daily life practices that is more discerning than those of individuals who lack such cross-border experiences. What’s more, several scholars have equated these competencies with school success (Suárez-Orozco & Suárez-Orozco, 2001). The possibility that this association might be intentionally leveraged is intriguing and worthy of further consideration.

Following researchers such as Collins and Blot (2003) and Street (1984), literacy is defined broadly in terms not only of the ability to read and write but also of the historical, economic, political, social, and cultural contexts that influence and shape the learning and use of literacy. In other words, literacy is viewed as a social practice (Barton, Hamilton, & Ivanič, 2000), one that is always connected to issues of power and ideology. Given that literacy differs depending on its particular context, it is more appropriate to speak of multiple *literacies* as opposed to a single type of literacy that is context-free and universal. What gets defined as literacy matters because practices that are included in these definitions find their ways into curriculum, assessments, and as a result, instruction. Bourdieu (1989) defined the ability to make distinctions of this type (i.e., what counts as literacy) as “power par excellence” because through it, one can actually “manipulate the objective structure of society” (p. 23). In this case, students who are far too often excluded from meaningful participation could find that their life experiences are recognized and acknowledged if transnational literacies are presented as desirable.

Immigrants’ engagement with literacy can create a space where it is possible to maintain, strengthen, and create new ties to co-ethnics as well as reach out to those from other groups (Lam, 2004). The types of literacies involved may include traditional print forms of literacy and digital literacies. Examples of print literacies are the remittances migrants send home (Cohen, 2004; Smith, 2005), which involve substantial amounts of paperwork, as well as the language brokering that occurs when linguistically demanding documents are translated for less-proficient bilinguals (Orellana, Reynolds, Dorner, & Meza, 2003). Digital literacies include text messaging, music and video remixing, fan fiction, social networking (e.g., Facebook, MySpace, YouTube), and online gaming. Significantly, these practices are considered “transnational” if they involve movement between the countries of origin and settlement. Guerra (2004) points out that, as a result of participation in transnational flows, many individuals learn to use literacy to “move back-and-forth with ease and comfort between and among different languages and dialects, different social classes, and different cultural and artistic forms” (p. 8). He calls this ability, which is reminiscent of the idea of dual frames of reference or bifocality, discussed above, “transcultural positioning.” The New London Group (2000, p. 14) calls this ability “the most important skill” that students need to learn. Finally, transnational literacy practices function to create and maintain transnational relations and identities (Lam, 2004), as illustrated in the next section.

Research on Transnational Literacies

Researchers are only beginning to examine literacy learning and use through the lens of transnationalism. This section reviews a number of empirical studies that use this framework to document the forms of literacy developed by immigrant youth.

Both Bartlett (2007) and Rubinstein-Ávila (2007) looked at the bilingual literacies and educational trajectories of Dominican youth living in different northeastern US cities. Significantly, Dominican immigrants constitute one of the most transnational populations in the nation (Guarnizo, 1997). Bartlett (2007), following a case-study design, found that her participant, Maria, faced many obstacles in a New York City high school but was ultimately able to reposition herself as a “good student” within this setting given that she completed all her schoolwork, associated with high-achieving students, insisted on taking classes only with teachers who cared about her, and ascribed to a schoolwide “opportunity narrative” that influenced her behavior. Another important finding of this study was that the school placed a high value on bilingual abilities, thus creating more opportunities for immigrant students like Maria to succeed. However, an important finding of this study was that the educators working with Maria had little or no understanding of the ways in which literacy was conceptualized and implemented in the Dominican Republic. These differences drove much of Maria’s seemingly incomprehensible behavior, and better understanding could have helped her teachers establish more meaningful links between her previous experiences and the demands of the US classroom.

Rubinstein-Ávila (2007), whose research likewise focused on a case-study participant, Yanira Lara, found that although Yanira’s transnational identity resulted in an admirable bilingual repertoire of literacy practices, she encountered many struggles at school. In particular, she was expected to simultaneously learn English, become academically proficient, and develop particular kinds of literacy and knowledge. This experience was especially taxing because the school did not value her prior language abilities or her out-of-school literacies, and her teachers often failed to explicitly teach her the language associated with school success. In these ways, her school experiences contrasted somewhat with those of Maria. In other words, neither of these young people found sufficient opportunities to make connections between their transnational lives and their school literacy experiences, nor did their teachers understand the ways in which one set of experiences might support and enhance the other. Both of these cases support the need for more information concerning transnational literacy practices.

Other scholars have focused on the experiences of Mexican-origin immigrants. Richardson Bruna (2007), for example, studied the informal literacy practices of three newcomers from Mexico in a mid-western high school. She discovered that these students used “tagging,” the practice in which they “write the name of their country, region of origin, or themselves . . . in public spaces” (p. 240) to signal their close ties to Mexico. Richardson Bruna interpreted these acts as “calls for help,” given that the students were positioned negatively within the classroom. In other words, she saw tagging as a form of “transcultural repositioning” (Guerra, 2004), which the students used to help negotiate complicated movement between two cultures. On a more positive note, Sánchez (2007), whose work focused on the narratives produced by Mexicanas living in the San Francisco Bay Area, found that, in the cocreation of a children’s book on the immigrant experience, the girls drew on narratives of family, migration, and a sense of “home” in two countries to produce a text that countered mainstream perspectives on Mexicans living in the US. In particular, the text portrayed immigrants in a positive light. Furthermore, the project allowed the three focal students to make use of their prior linguistic and cultural knowledge, or their funds of knowledge (González, Moll, & Amanti, 2005), to create a sophisticated literacy artifact, one that both validated their identities and served an authentic purpose. It is worth noting that Sánchez (2007) designed a way to capitalize on the unique forms of knowledge the girls possessed as youth participating in transnational practices to enhance their literacy development in an out-of-school context. As implied above, such opportunities are rarely available within mainstream school classrooms but their existence provides at least a hint of the possibilities they afford.

Two final studies reported on the digital literacy practices of immigrant youth residing in major US cities. McGinnis and her colleagues (McGinnis, Goodstein-Stolzenberg, & Saliani, 2007) explored the relationship between transnational identities and the multimodal textual practices of online communication sites. The participants in their study were three high-school-aged students (a Colombian, an American-Bengali, and a Jewish-American) living outside New York City, and all three were found to regularly access online sites (e.g., personal Web pages, blogs). Significantly, their participation in digital literacy practices provided a means of enacting, negotiating, and cultivating transnational identities that spanned national boundaries. For example, the participants used multimodal and multilingual forms to express their feelings and opinions about important events in their lives and to maintain contact with individuals in Colombia, India, and Israel. In a similar study, Lam and Rosario-Ramos (2009) set out to identify the Internet-based literacy practices of a group of immigrant students in a high school located outside Chicago. Based on survey data, the researchers found that most of the students used the Internet to communicate across borders (e.g., via instant messaging, e-mail, chat rooms, Web sites, and blogs) and that they relied on their multilingual competencies to access resources and to manage social relationships. The students' Internet use also allowed them to maintain and develop their first languages, to improve their English, and to acquire multiple perspectives and points of view on significant events and situations. Together, these two studies suggest that online spaces offer distinctive possibilities for immigrant youth to express and negotiate complex, multinational identities while simultaneously developing and exploiting their multilingual abilities.

Illustrative Composite Vignette

The following text provides an illustrative composite vignette for the purpose of showing what educators can learn about their students' transnational activities. This vignette is grounded in the experiences of various youths that the authors have personally known or worked with in their research, and it makes it possible to highlight potential connections to academic language and literacy development, which are described below.

For the purposes of this discussion, our composite student, Javier, is a 17-year-old high-school student originally from the Mexican state of Puebla. He lives with his mother, father, and seven-year-old sister. His mother works for at least eight hours every day in a dry-cleaning establishment where she irons clothing, while Javier takes care of his younger sister. His father works in construction where he earns somewhat better than minimum wage. Specifically, he uses skills learned in Mexico as a brick mason to repair cracked and failing mortar in US homes. Javier has struggled to learn English since moving to the US three years ago, even though he has been enrolled in supplemental English as a second language classes in his high school. He has grade-level-appropriate literacy abilities in Spanish (although they are rarely acknowledged at school), and has recently begun to actively seek out books and other resources dealing with Mexican history, such as texts about the Mexican Revolution and indigenous cultures. It is of concern that he is receiving low to mediocre grades in his content-area classes of math, science, and history. Yet many days he spends two to three hours engaged in digital literacy activities. These include e-mail, chat, text messaging, downloading music, and online gaming. He also created a Facebook account to keep in touch with family and friends in his hometown of Atlixco, which is about a 30-minute drive from the metropolitan city of Puebla. Javier uses both English and Spanish when he communicates with friends. That said, his writing includes many abbreviations and noticeable dialect features reflective of his working-class background from south-central Mexico.

Instructional Potential and Application for Transnational Literacies

Although fictitious, the experiences of Javier convey those of several young people that the authors have known and worked with. Their review of the literature on transnational literacies has led them to identify a number of potential implications for teachers and others concerned with the academic achievement of students engaged in these types of behaviors. In particular, the authors recommend that teachers use the general topic of transnational activities, such as digital-literacy use, as an opportunity to get to know their students better. Their experience has been that young people welcome interest in their transnational literacy activity and are more than willing to share this facet of their lives with concerned adults. The authors have received interesting responses to questions such as: Can you tell me about your activity online? For example, what games do you play? Where do your friends live that play these games with you? How many different countries do they live in? How often do you spend time online? Which programs and activities do you find most interesting? Educators can learn a great deal about their students' lives, interests, and routine activities through such conversations. They can likewise design classroom activities that draw on and extend this knowledge (see Jiménez, Smith, & Teague, 2009, for a number of specific examples involving transnational literacies).

As noted in the literature review and the vignette above, there is potential for youths who engage in transnational literacy activities to enhance and deepen their reading and writing skills in their first language. In addition, they are also able to enter into social networks with native English speakers through digital literacy activities that might not otherwise be available to them in face-to-face situations. All of these activities can provide information, contacts, and other resources to young people at local, regional, national, and international levels. The resulting potential for language development, whether in the first or the second language, is obvious. Finally, since the literature review revealed that digital and transnational literacy activities could have important ramifications for academic achievement (e.g., using these funds of knowledge to scaffold students' learning of content-area material), it can be argued that teachers' understanding of these activities can only help to enhance this achievement. Significantly, a willingness to acknowledge and refer to these activities during classroom discussions helps establish a point of connection between students and their teachers and makes school learning more meaningful.

Literacy in Community Settings

MASTIN PRINSLOO

A rich direction of research in literacy studies in recent decades has been around literacy in community settings. The impetus for such work has been the challenges coming from linguistic anthropologists and literacy ethnographers to the notion of literacy as the same thing across all kinds of settings and under all kinds of conditions. The tendency is often to ask why certain people do not read and write, rather than to ask what forms of reading do happen. A focus on literacy in community settings, on the other hand, shows that reading and writing can be taken up in different ways by different individuals and groups of people. Literacy is seen as embedded in social and cultural practices, not simply as a skill learned through formal schooling and detached from other social practices. This focus suggests that it is not helpful to think in terms of a single literacy when there is a remarkable diversity in the ways that people read and write for the performance of widely varying personal, social, and economic functions.

Varying “Ways With Words”

A strong impetus for an interest in literacy in community settings came from Heath's (1983) classic study of south eastern communities in the USA. Heath questioned why Black students were failing in the recently desegregated schools, and she contrasted their language and literacy socialization in community settings with children of White mill-workers in a neighboring community as well as with middle-class children in the same town. She found that reading and writing happened in all three communities but that local communities had varying histories and different rules for socially interacting and sharing knowledge and opinions. For example, a letter sent from school to a middle-class parent was treated as a private and confidential exchange, whereas in the Black working-class community of Trackton it was a collective event, with one person reading the letter aloud and neighbors and family discussing its meaning and what the response should be. This literacy event was characterized by a particular blend of text, talk, distribution of action and, turn taking in communication that was community-specific and consistent with patterns of mutual child raising which contrasted markedly with the other local communities in the study. Heath argued that the different ways that children learned to use language, including written language, were dependent on the ways in which each community structured its family life, defined the roles that community members could assume and their concepts of childhood that guided child socialization. As regards the relationship between speech and text, she suggested that literacy events have social interactional rules which regulate the type and amount of talk about what is written, and define ways in which oral language reinforces, denies, extends, or even sets aside the written material. These rules, she argued, vary across distinct cultures, local groupings, or speech communities. Heath contrasted these local “ways with words” with expectations and rules for text-linked activities in the formal institutional setting of schools. She argued that the ways of meaning of socially positioned individuals were not the same across communities and that middle-class children were advantaged by the closeness to school ways of their home and community ways with language.

Heath's findings supported Scribner and Cole's groundbreaking research (1981) of literacy and cognition in the African state of Liberia, which found that cognitive skills associated with literacy varied dramatically in relation to the wider social practices within which literacy was embedded. Scribner and Cole sought to understand literacy as always constituted within socially organized practices which make use of a symbolic system or systems as well as a technology for producing and disseminating it. The nature of these practices, including, of course, their technological aspects (their scripts, languages, and media), would determine the balance of skills and the consequences associated with literacy. Scribner and Cole thus noted that letter writing amongst the Vai in Liberia (perhaps using the Vai script and language) must be considered as a literacy practice different from, for example, the keeping of a personal diary, or a ledger, since each of these required different measures and weightings of technology, knowledge, and skills, as they were part of different social activities or practices.

Street's (1984) study in Iran helped to shape the idea of there being different kinds of literacy, and of there being real differences between what reading and writing were about in various contexts. As he described it, while doing anthropological research in a village he started to notice the variety and complexity of literacy activity at a time when his encounter with people outside of the village suggested the dominant representation was of "illiterate backward villagers." Looking more closely at village life he saw several different sorts of reading and writing going on: in a traditional "Quoranic school," in the new state schools where English was the language of learning, and on the part of traders in their buying and selling of fruit to urban markets. Versions of literacy by outside agencies (e.g., state education, UNESCO, and national literacy campaigns) did not capture these complex variations in literacy happening in one small locale where the people were generally characterized as illiterate.

Reading and Writing as Social Practices

These studies set the basis for later research which focused on literacy as situated social practice (sometimes described as the "New Literacy Studies," as in Gee, 1996). This approach to literacy studies questions the stereotype of the ideal reader as, generally, a book reader who reads for pleasure or for "staying informed"; or a student who successfully carries out reading and writing tasks to the satisfaction of her instructor. In one example, Taylor's (1983) study of family literacy showed that even in the poorest and most marginalized inner city communities, literacy played a part, enabling families to make sense of the world and to interact with it. Literacy researchers study literacy in community settings, in everyday social life, on the understanding that reading and writing practices are always embedded in particular kinds of social activity; that reading and writing are best studied not as basic skills and not as the same things under all circumstances; that they follow different meaning conventions, and require different skills for their successful use, when they function in different social contexts, for different purposes, as part of different human activities. This work thus opposes the position which views literacy as merely a matter of general skills, as a unitary process, one where "readers" and "writers" are generalized subjects without any social location and who are more or less efficient processors of text.

Local and Vernacular in Contrast With Dominant and Institutionalized Literacies

Barton and Hamilton (1998) observed community members in Lancaster, England and asked them to reflect on their literacy practices. They found the notion of community to be useful in examining the "realm of local social relations which mediates between the

private sphere of family and household and the public sphere of impersonal, formal organizations" (Barton & Hamilton, 1998, p. 15). They pointed out, following Heath's (1983) example, that, important as family practices are for children's literacy development, these practices take place in larger community contexts that influence family activities. The researchers drew a distinction between dominant (institutionalized) and vernacular (self-generated) literacies. Vernacular literacies were activities that included reading and writing as voluntary and self-generated:

The vernacular literacy practices we identified are rooted in action contexts and everyday purposes and networks. They draw upon and contribute to vernacular knowledge, which is often local, procedural, and minutely detailed. Literacy learning and use are integrated in everyday activities and the literacy elements are an implicit part of the activity, which may be mastering a martial art, paying the bills, organizing a musical event, or finding out about local news. Literacy itself is not a focus of attention, but is used to get other things done. Everyday literacies are subservient to the goals of purposeful activities and are defined by people in terms of these activities. Hamilton (2000, p. 5)

Hamilton (2000, p. 5) summarized the range of "vernacular literacies" that the researchers found:

Often they are humorous, playful, disrespectful, sometimes deliberately oppositional. When questioned about them, people did not always regard them as real reading or real writing. Some vernacular literacies are deliberately hidden: these include those which are personal and private, where reading or writing are ways of being alone and private, ways of creating personal space. There are also secret notes and letters of love, abuse, criticism and subversion, comics, scurrilous jokes, horoscopes, fanzines, pornography—some but not all of which will be revealed to the researcher's gaze.

The "Passing" Quality of Family and Community Literacy Practices

Varenne and McDermott (1998) focused on literacy at a family level that supported the work on literacy in community settings. They described family literacy as not one for which the members are accountable in the same way that children are held to account in school. They pointed out that one does not fail familial or community literacy as it is all but invisible, embedded in other activities, like shopping, writing to a relative, paying an invoice, or applying for something or other. "In reading the label on children's medicine no such activity would end with the comment 'Good! You get an A for being able to read the label. Now let's do some math'" (Varenne & McDermott, 1998, p. 195). This "passing" quality of family and community literacy has been noted by numerous researchers, where reading and writing are so much part of other activities that the literacy bits are hardly noticed. For example, Kell (1996, p. 24) studied the literacy practices of a middle-aged, unschooled woman who was a community-activist in a shack settlement outside Cape Town. This example both reverses the more familiar perspective of parent helping child and also illustrates the routine or "passing" nature of the literacy practices, where reading and writing are:

a delivery man . . . came around with the vegetables and gas cylinder that she needed. Winnie brought out her invoice book, and the deliveryman wrote down what she had bought . . . She said that her daughter Portia would check what he had written . . . As I left Portia came out of another room, picked up the book without a word between her and her mother and ran through the page very quickly.

Kell's work, along with others (e.g., Volk & de Acosta, 2001), highlights the intergenerational nature of much of the literacy practices that occur in community settings. This intergenerational nature of family- and community-based literacy practices also disrupts traditional notions of expertise or what it means to teach. Children (or others who also do not fit the traditional "teacher/parent/elder" notion of experts) often become the leaders/experts in these literacy practices.

Following a similar ethnographic approach to Barton and Hamilton (1998), Prinsloo and Breier (1996) worked with a team of researchers and collected a range of studies of literacy practices in local communities in South Africa, including case studies of people attending voter education classes and voting in the first democratic national elections that ended apartheid as a system of government; of agricultural laborers on wine-making farms; of workers in an asbestos factory and at a school; on residents of urban and rural townships; of communal goat farmers in the Namaqualand semi-desert; of gangsters and social activists living in a shack settlement outside Cape Town; and of taxi-drivers in Cape Town, with and without schooling who had to deal with a range of kinds of reading and writing in their daily work. Researchers paid particular attention to evidence and accounts of unschooled adults developing literacy-linked capabilities and found that the learning of (often narrow) task-specific literacies in the course of task completion was the most frequent and sustaining form of literacy acquisition on the part of unschooled adults. Following Lave and Wenger (1991), the research described these kinds of learning as "apprenticeship processes," because these literacies were learned from other people, they were context-specific, and their acquisition was analogous to the ways crafts are learned, in that they were learned and used under guidance, in the everyday course of events. The research pointed to the importance of social networks and interpersonal relationships in these practices. People drew on these social networks to help them with particular literacy requirements. Within these networks it is possible to identify people acting as mediators, mentors, brokers, sponsors, and scribes for others. The research also points to the distributed, social, and power-shaped nature of literacy events and practices, where such assistance can be both enabling and constraining. The focus in this research thus shifts from literacy as something people in marginalized communities have not got, to the many different ways that people engage with literacy. The study of community literacies recognizes difference and diversity and challenges how these differences are valued within society.

Blommaert (2007b) brings the interesting idea of "scale" to the study of literacy in community settings. He suggests that language practices, including literacy practices, are subject to social processes of hierarchical ordering. One consequence thereof is that one can be a "good" user of language or literacy in the neighborhood network, but a "bad" one in the labor market or in the school system. He described what he calls "grassroots literacy," which he finds to be a characteristic form of writing across poor, marginal communities in the African settings that he studied. He describes it as a nonelite form, characterized by what he calls "heterography"—the deployment of graphic symbols in ways that defy orthographic norms: words are spelled in different ways, often reflecting the way they are pronounced in spoken vernacular varieties, rather than following conventional orthographic norms or prestige language forms. He also finds an uncertainty about linguistic and stylistic rules, as well as a common use of drawing as well as writing. He says that such texts often have only local value. Examined from beyond the local, they appear as inferior examples of writing, pointing to the low status of these persons on a larger stage (Blommaert, 2007a).

“Funds of Knowledge”

Influential work carried out for a number of years by Moll and his colleagues has focused on studying household and classroom practices within working-class and rural Mexican communities in the southern USA. The research aims to describe the *funds of knowledge* of the home environment. These are “historically accumulated and culturally developed bodies of knowledge and skills essential for household or individual functioning and well-being” (Moll, Amanti, Neff, & Gonzalez, 1992, p. 133). They include family know-how in areas such as agriculture, economics, construction, religion, arts, and repair. Families develop social networks that help them deal with their environment and develop and exchange resources. These networks are flexible and active and may involve persons from outside the home. The research is concerned to make such family knowledge and social relationships visible to educators as resources which can be used to enhance school learning. For example, children’s involvement in informal buying and selling activities was used by educators in schoolwork that started with various aspects of buying and selling, including the literacy involved, and developed into other curricula activities, in math and other areas. This work is concerned to show how the wider utilization of children’s cultural resources could assist the development of biliterate skills and practices in Spanish and English. In similar fashion, Barton and Hamilton identified areas of vernacular knowledge as including home economics and budgeting, repair and maintenance, childcare, sports, gardening, cooking, pets and animal care, and family and local history. Some people had also developed knowledge of legal, political, health, and medical topics (Hamilton, 2000).

Volk and de Acosta’s (2001) study of Puerto Rican children living in a poor neighborhood of a large US city examined what counted as literacy in the classroom, homes, and churches of three Spanish dominant children living in the USA. They were concerned to go beyond research that focuses *solely* on parent–child interactions, thereby missing the complexity and richness of literacy practices occurring in the everyday lives of these children in their wider interactions. They argued that the literacy practices of home blended literacy practices valued in schools with practices valued in their churches and in so doing created collaborative literacy practices rooted in their culture.

Community and Schooling

Barton (2009, p. 43) points out that educators and educational policy makers sometimes find it frustrating that researchers studying everyday life in community settings do not immediately provide “solutions” for educational problems. However, he says that there is a set of steps:

firstly, there is a need to understand what people do, their practices; then it is essential to see how people learn; and only then can we turn to questions of how to teach, or how to support learning. Learning does not just take place in classrooms and is not just concerned with methods. The approach requires educators and researchers to look beyond educational settings to vernacular practices and informal learning, and to the other official settings in which literacies play a key role.

Dyson’s numerous studies (e.g., 1993, 2003) show how children from a variety of social, cultural, and linguistic backgrounds, if allowed to by their teachers, draw deeply upon their out-of-school knowledge of nonacademic social worlds to negotiate their entry into school literacy. Their family and peer relationships are social worlds that provide them with agency and meaningful symbols, and shape their decisions about what to write, and

with whom. With the help of a supportive teacher who helps them weave their own stories, interests, and experiences into the school curriculum, they reveal the breadth of their language and sense-making repertoire. Dyson advocates a permeable curriculum where responsive teachers can draw children into understanding and using symbols and resources in school-like ways, while continuing to develop their own agency as regards social relationships and meaning construction. Purcell-Gates (2007) makes a similar argument based on her research of literacy in community settings. If the curriculum does not relate to students' lives outside of school, their education slides right off them, she says. She argues that the more relevant teachers make literacy instruction to students' lives, the more likely they are to learn.

"Community" as a Shifting Signifier

In conclusion, it can be pointed out that the idea of community as indicating a clearly defined physical and social space where members share a number of features has become increasingly displaced in recent decades by a sense of local neighborhoods as complex sites, where members often have diverse backgrounds, speak different languages and have other kinds of divergences. For example, a number of studies of multilingualism in local settings have been carried out (e.g., Martin-Jones & Jones, 2000; Collins & La Santa, 2006; Reese & Goldenberg, 2006; Perry, 2009) which examine the complex and mobile nature of people's interaction in social spaces under global conditions of movement and migration. In addition, children's and adults' engagements with "virtual communities," where they can access literacy activities across space and time, expands in interesting and challenging ways the question of what counts as community literacy in contemporary times (Marsh, 2006).

Literacy in Multilingual Classrooms

OFELIA GARCÍA AND NELSON FLORES

When one hears the word literacy, the first image that usually comes to mind is of a child learning how to read and write. In this commonsense view, literacy is seen as an autonomous skill that is universal and literacy instruction is seen as culturally neutral. The idea is that all children learn to read and write in the same way and literacy instruction is the same for all students. Most schools adhere to this concept of *literacy as an autonomous skill*. This often times results in reading activities devoid of semiotic cues, or texts requiring background knowledge that students do not always have. Students are then expected to answer multiple-choice questions where there is only one correct answer. Similarly, school writing oftentimes consists of writing academic essays to an unknown audience. In short, too often schools treat literacy as a skill that one masters outside of any particular context and focus on developing *functional literacy*, or the skills needed to pass standardized forms of assessments.

While many schools still subscribe to the view of literacy as an autonomous skill, *socio-cultural studies of literacy* have demonstrated that literacy practices are actually influenced by social, cultural, political, and economic factors. In this view, literacy is not an autonomous skill that can be separated from this larger societal context. Therefore, rather than being a neutral process, literacy practices emerge in particular social and politics contexts that are inevitably embedded in relations of power that privilege certain types of literacy and subjugate others (Street, 1984, 2005; Martin-Jones & Jones, 2000).

Heath (1983) provides one example of the complicity of schools in these relations of power. She documents the difference in literacy practices between black and white working class communities. She finds that in the white community children are expected to focus on facts and to put events into the correct order when narrating stories, while in the black community children are expected to fictionalize true stories in order gain the attention of their elders. The point Heath makes is that the academic literacy practices of schools reflect a certain cultural orientation that marginalizes children who have been socialized into different literacy practices. It is important, therefore, to learn about the literacy practices of students and use them as a starting point in literacy instruction.

This sociocultural framework has also been applied to the development of *biliteracy* skills. Using a sociocultural framework, biliteracy is about much more than reading and writing in two languages. Lüdi has proposed a broad definition of *biliteracy* as:

the possession of, or access to, the competences and information required to accomplish literacy practices which an individual wishes to—or is compelled to—engage in everyday situations in two languages, with their corresponding functions and in the corresponding cultural contexts. (Lüdi, 1997, p. 207)

Some scholars prefer the term *multilingual literacies* as a way to emphasize the coexistence of not just two, but multiple languages and literacies (Martin-Jones & Jones, 2000). Multilingual literacies also refers to the multiplicity of individual and group repertoires and the multiple ways in which people draw on, and combine codes in their communicative repertoire.

Nancy Hornberger's (1989, 2003) model of the *continua of biliteracy* framework identifies the major social, linguistic, political, and psychological issues that surround the development of biliteracy, as they relate to each other. The interrelated nature of Hornberger's continua supports the potential for positive transfer across literacies. Hornberger argues that bilingual learning is maximized when students are allowed and enabled to draw from across all their existing language skills, rather than being constrained and inhibited from doing so by monolingual instructional assumptions and practices. The nested nature of Hornberger's continua (2003) also shows how transfer can be promoted or hindered by different contextual factors.

While a sociocultural approach to biliteracy points to the hybrid and complex language and literacy practices of bilingual and multilingual populations, the autonomous view of literacy has had a great effect on the type of literacy instruction received by bilingual and multilingual students. This is because an autonomous view of literacy goes hand in hand with an autonomous view of language that sees language as a culturally neutral skill that one can master outside of any particular context. The result of this ideology has been the creation of many biliteracy models that do not reflect the actual language practices of bilingual and multilingual students. One example of this is the separation of languages in bilingual instruction in ways that do not reflect the hybrid language practices of bilingual students. While the separation of languages for instruction is seen as neutral, this process marginalizes the multiple and hybrid language practices that are increasingly common in the 21st century (Cummins, 2008; García, 2009; Blackledge & Creese, 2010).

There are three models of biliteracy use that reflect the autonomous view of language through the separation of the languages of instruction (García, 2009, chap. 14, 2010). None of these models stress the importance of language and literacy practices in the larger community. For these models, school language and literacy practices can be separated from larger societal processes. The first of these models is the *convergent monoliterate model*. This model is usually used to teach language-minority students who speak languages that either are not written or have very low status in society. In this model, both languages are used for discussion, while the dominant language is used for reading and writing. A variation of this model is the *convergent biliterate model* where two languages are actually used for literacy, but literacy in the minoritized language is used solely as a bridge to that in the dominant language. Both of these models would fall under the category of *subtractive* in that they both seek to replace the minoritized language with the dominant language. Bilingual programs that seek to develop an *additive* "balanced" bilingualism often use a *separation biliterate model*. The languages are kept separate and teachers and children match the language in which they are communicating around writing to the language of the written text. Students are encouraged to speak and think in the language in which they are reading and writing. The literacy theories supporting all these three models do not take into account the hybrid linguistic practices of bilingual and multilingual students.

Until recently, the most popular position for the acquisition of biliteracy was that literacy in a first language had to be developed before literacy in a second language was acquired. This *sequential view of biliteracy* posits that literacy in the second language should not be introduced until a child has competence in speaking, reading, and writing in the first language. The idea is that successful readers in a first language must reach a *threshold* for transferability of literacy skills to occur (Brisbois, 1995).

On the other side of this debate are those who argue for *simultaneous biliteracy*. Proponents of simultaneous biliteracy argue that children can learn to read and write in both languages at once, even as they are still mastering oral language skills in an additional language. The success of immersion bilingual programs in Canada where Anglophone children learn to read in French, a second language, without any adverse effects has challenged the position that literacy in a first language is essential to acquire literacy in a second one (Cummins,

1979). Similar results have been found in studies of community language classes and complementary schools in Great Britain (Kenner, 2000; Li Wei & Wu, 2009; Blackledge & Creese, 2010), as well as heritage language programs in Canada (Beynon & Toohey, 1991). These programs all demonstrate that it is indeed possible to teach students literacy in two languages simultaneously and that it is not necessary to develop the first language to a particular threshold before introducing literacy in the second language (Edwards, 2009).

Notably, in both sequential and simultaneous approaches to biliteracy, children usually acquire different-language literacy in separate educational spaces. In the sequential approach, students are taught exclusively in their native language until they are transitioned to classes where literacy is taught in the additional language. In a simultaneous approach, the teaching of literacy in one language is separated from the teaching of literacy in an additional one by day, teacher, or subject. In short, the view of both of these approaches is that each literacy develops separately, even if simultaneously, and that students must develop two separate monolingual literacies. In fact, most handbooks for teaching biliteracy propose reading and writing approaches that are similar to those that are used to teach literacy in one or the other language. It is more difficult to find studies and texts that describe how biliteracy is simultaneously and integratively acquired because bilingual schools are usually not organized in ways that allow this (García, 2009). Said another way, these biliteracy approaches are premised on autonomous approaches to language and literacy that do not validate the hybrid language and literacy practices of bilingual and multilingual students.

Recent sociocultural approaches to language and literacy have attempted to move beyond these autonomous approaches arguing that it is important to recognize and build on the language and literacy practices with which students come to school (Martin-Jones & Jones, 2000). Therefore, rather than imposing a language separation that may not be reflective of the learning community, many scholars have begun to argue that the hybrid practices of increasingly globalized communities should be the starting point for pedagogical approaches. García, Bartlett, and Kleifgen (2007) propose the concept of *pluriliteracy practices*, as a framework for working toward the affirmation of both the literacy and language practices of these multilingual populations. *Pluriliteracy practices* include four principles:

- an emphasis on *literacy practices in their appropriate sociocultural contexts*, as influenced by different cultural contexts and various social relations;
- the *hybridity* of literacy practices, especially as afforded by new technologies;
- the increasing *interrelationship of semiotic systems*, a product of new technologies;
- *increased valuing of different literacy practices*, including those that have no place in school, and drawing on different literacy practices to develop school-based literacy.

In short, pluriliteracy practices embrace the hybrid literacy and language practices of multilingual students and use these hybrid practices to develop pedagogical strategies.

A model that is informed by a pluriliteracy approach is the *flexible multiple model of biliteracy* (García, 2009). In this model multiple language practices and media are used in literacy practices. Teachers encourage children to translanguage (García, 2009, extending Cen Williams, as cited in Baker, 2001), that is, to use all linguistic practices and modes as sense-making resources in order to engage with texts. The children use all their language practices to build background, to question the text, to think about strategies; and they draw not only from print to make sense of texts, but rely also on images, videos, music, and other technology-enriched signs. This approach is premised on the idea that language and literacy practices are inherently social processes that must be included in schools. It is also premised on the idea that students must be *apprenticed* as members of pluriliterate social practices. Students learn pluriliteracy practices in *embodied action*, that is, by being

4 LITERACY IN MULTILINGUAL CLASSROOMS

able to draw from all their language practices while being immersed in reading and writing practices that include, but are not limited to, two or more standardized academic languages.

Rejecting an autonomous view of language and literacy also requires embracing the struggle that occurs in classrooms as hybrid language practices interact and conflict with one another. Academic literacy is one form of literacy. For example, academic written texts tend to be more linear and non-repetitive than other texts. This type of writing may feel constraining to somebody who comes from a home where literacy practices are more open-ended, circular, elaborated, and repetitive. To assume that this student will be able to say everything that is in his/her heart and mind in academic discourse is to deny power and to treat academic discourse as neutral and autonomous (Lu, 1991). Therefore, because of the different worldviews and sociocultural contexts of the two or more languages and cultures of bilingual schools, pluriliteracy practices and teaching must also read and write different worlds and create spaces to reflect on, explore, and question them (García, 2009).

All learners need extra support or *scaffolding* to develop academic literacy. Scaffolding is a combination of the constraint of structure with its release, as a result of the teacher's innovation, exploration and improvisation (van Lier, 2004). Learners who are developing an additional language need more scaffolding and often for a longer period of time. A pluriliteracy scaffolding strategy adapts the following five scaffolding structures so as to incorporate the *dynamic languaging* of bilingual and multilingual students and teachers (García, 2009):

- *Routines* where the teacher establishes contextual and spatial instructional routines and language patterns. The languages of the routines can be varied and respond to students' interests and motivation, as well as the context of the lesson.
- *Contextualization* through the teacher's use of the students' home language and cultural practices, as well as other paralinguistic strategies such as: body language and gestures, visuals, manipulatives, realia, technologically enriched practices, graphic organizers, charts, diagrams and maps.
- *Modeling* by the teacher of all routines and language use, as well as verbalizing the actions and processes of the lesson through *think-alouds* that can incorporate all the language practices of students.
- *Bridging and schema building* by having teachers build on prior knowledge by previewing the material to be taught. This can be done in a language other than that of the lesson, so as to build on the multilingualism of the classroom.
- *Multiple entry points* with teachers allowing students to demonstrate their understanding in different ways and differentiating instruction for students with diverse characteristics.

Scaffolding strategies must build on the dynamic plurilingualism of the children in interaction with the teacher.

García (2009) provides examples of this type of plurilinguistic scaffolding in learning to read in an additional language:

- Expand the students' background knowledge for improved comprehension, and develop students' abilities to relate the text to prior experiences or learning.
- Activate three types of schemas—*linguistic* schemas, based on prior language development; *content* schemas, based on prior knowledge of content; and *text* schemas, based on knowledge of rhetorical structure of the text.
- Provide students with *explicit instruction* in such literacy strategies as previewing, skimming, adjusting reading rate, recognizing the author's purpose, making inferences, and separating fact from opinion.

- Teach vocabulary and other structural characteristics of the language and the text explicitly.
- Encourage students to *read extensively* to become productive readers.

For writing, Derewianka (1990) has identified four stages of *explicit literacy teaching*. García (2009) has adapted them for bilingual and multilingual students, and we extend them here:

1. *Building the field*. During this stage, teachers and students build background knowledge bilingually. There is much speaking, listening, reading, information-gathering, note-taking, and reading in one language, the other, or both at the same time, in order to build the field.
2. *Modeling the text type*. During this stage, students and teachers make decisions about the ways in which they are going to use written language. Students become familiar with the purpose, overall structure and the linguistic features of the type of text they are going to write through teacher modeling. If hybrid literacy practices are used, students take a more active role in providing the modeling.
3. *Joint construction*. During this stage, the teacher and the students write the text together. The students contribute the ideas, sometimes using hybrid language practices.
4. *Independent writing*. During this stage, students write individually or in pairs. They first write a draft, then self-edit. Next, they discuss the draft with their friends and teachers. Finally, they produce a published text.

While these strategies can be used as a starting point, it is important not to take them as a blueprint for instruction. Instead, all literacy pedagogical approaches must be contextualized and begin with the language and literacy practices of the community of learners that are in any particular classroom.

Cummins (2006) describes the use of *identity texts* as a way of highlighting the important role of negotiation of identities in all students' learning. Cummins builds on the four components of the *multiliteracies pedagogy* proposed by the New London Group (1996)—situated practices, overt instruction, critical framing, and transformed practices—but proposes an “academic expertise framework” which argues that *maximum identity investment* on the part of students is key to optimal academic development (Cummins, 2001, 2006). In the school described by Cummins, young students of diverse linguistic background create stories in English which are then translated with the help of older students, parents, and teachers into their home languages. These multilingual stories are then published on the Web, accompanied by images, spoken, musical, dramatic renderings, or combinations in multimodal form.

Teachers work increasingly in multilingual classrooms where students' language practices include multiple languages. As we have shown here, literacy is much more than the ability to read and write. Literacy practices are enmeshed within and influenced by social, cultural, political, and economic factors, and literacy learning and use entail complex social interactions. Thus, teaching literacy in multilingual classrooms necessarily has to move towards a *flexible multiple model of pluriliteracies* where students are encouraged by the teacher, even when she is monolingual herself, to use all their home and community language practices in making sense of the school text. Only then will students be able to engage texts in an additional language while maximizing their identity investment, and in so doing they will also develop the pluriliteracies that will be increasingly needed in our globalized world in the 21st century.

Literacy Practices in Virtual Environments

GLORIA E. JACOBS

Introduction: Virtual Environments

Developing an understanding of literacy in virtual environments is challenging because virtual environments are rapidly emerging and evolving, as are the language and literacy practices associated with those environments. Nonetheless, research is beginning to provide insights into the literacy practices inherent in virtual environments and what those practices mean to people who participate in virtual environments.

Virtual environments, or virtual worlds, are defined as “online spaces where participants usually adopt one or more avatars and interact with both objects and other users” (Davies & Merchant, 2009, p. 79). Virtual worlds can include online game environments such as *World of Warcraft* or simulated multipurpose environments such as *Second Life*. Virtual worlds emerged out of the text-based worlds such as MUDs (MultiUser Dungeon) that arose during the late 1980s (Steinkuehler, 2007). Even though virtual worlds now are filled with visual representations of objects, people, and creatures, and include the capability for voice communication, they continue to include alphabetic text as a form of communication and information-sharing (Steinkuehler, 2007; Merchant, 2009). Given that virtual worlds contain what Steinkuehler (2007) calls a “constellation of literacy practices” (p. 297), this chapter considers people’s engagement with chat rooms, texting or instant messaging, and fanfiction, as well as gaming and immersive environments such as *Second Life*. Including such research allows for the identification of patterns of language and literacy use that have emerged across a variety of virtual spaces, rather than being limited to specific virtual sites of practice.

What Is Literacy in a Virtual Environment?

Before proceeding with a discussion of literacy in virtual environments, it is first useful to briefly set forth a definition of literacy, and to consider how the definition of literacy is itself changing in response to the emergence of virtual environments. Literacy has traditionally been defined as the ability to read or write typographic texts; however, in the 1980s a body of research known as New Literacy Studies turned attention away from the psychological and cognitive aspects of coding and encoding text, and toward the socially and culturally situated nature of literacy use (Gee, 2000). New Literacy Studies argues that what counts as a text, and what counts as literate behavior, are determined by the cultural, historical, and political context of the community. Therefore, learning to read or write one type of text, or within one context, does not necessarily mean that a person knows how to read or write another type of text, or do so in another context (Gee, 2000). Because literacy is seen as occurring in social situations rather than only in school-based environments, definitions of text have been expanded to include texts that are used in a multitude of contexts. Therefore, with the increased capabilities provided by digital technologies, literacy now includes online chats, messages, videos, sound files, remixes, hyperlinked

2 LITERACY PRACTICES IN VIRTUAL ENVIRONMENTS

Web pages, wikis, blogs, image-sharing, social networking sites, gaming environments, and so on (Lankshear & Knobel, 2003).

Such a definition of literacy and texts changes the “semiotic landscape of the text” (Carrington, 2004, p. 218) and complicates what is understood to be the act of encoding and decoding. As Carrington points out, digital texts can consist of a blend and layering of graphics and graphemes (letter forms), sounds, images, and movement, which is further complicated by the synchronous nature of online interactions and the sometimes truncated space in which to communicate (often limited to 140 or 160 characters). However, even though these environments may have still and moving images or sounds as a central feature, typographic text remains a constant even when the typographic is secondary to the visual (Davies & Merchant, 2009). Therefore, as Davies and Merchant suggest, not only do users have to know how to negotiate the graphic nature of the virtual world, they must also employ text-based strategies and skills, and understand the relationship of the typographic to the graphic. A definition of literacy in virtual environments must then include how a person reads online texts, images, and conversations, so that online literacy “requires that students extend their understanding of technology to include understanding how to use it responsibly and how to ‘read’ authors’ intentions by making inferences and comprehending the codes involved in the online world” (Adams, 2009, p. 58). In addition, the texts that shape the virtual world include environmental print, tool tips, hypertext links, and interactive chat (Merchant, 2009). Environmental texts include items such as signs, logos, advertisements, and so on, that make up the texture of the virtual world. Tool tips are typographic texts that guide users in their use of the software. Hypertext links direct participants to another site, and interactive chat allows participants to communicate with one another as they play an online game.

Adams’s (2009) definition of literacy in virtual worlds is based on traditional definitions of literacy that focus on decoding, inferencing, and comprehending. McDougall (2007), however, argues that games and virtual environments lead the reader into a different kind of relationship than that experienced with typographic, ink-and-paper texts. He claims that gaming and virtual environments transgress traditional text-reader relationships by offering the participant the chance to both read and write the story. He suggests that as people are engaged in creating a virtual world, they are players, authors, readers, and analysts at the same time (p. 122). The transgressive nature of these texts, he argues, becomes problematic within classroom environments that tend to see texts and assessments through a traditional lens. Teachers reconcile this discontinuity between online texts and school-based texts by viewing the immersive environment as “literacy by stealth” (Merchant, 2009, p. 50), and as a springboard to more traditional literacies, rather than as a legitimate literate form in its own right.

The development of literacy in virtual space remains controversial in the public eye, because these are visible spaces of language change. Specifically, the synchronous and immediate nature of language use in virtual environments is akin to speech, but the typographic representations are built upon the more static forms of writing (Merchant, 2001). What happens then is that conventions of speech are transferred into written forms, which are often construed as examples of poor writing skills (Jacobs, 2008).

Like McDougall (2007), Merchant (2009) suggests that innovative digital literacy practices “call into question deeply held assumptions about literacy, about literacy instruction and even the teacher-pupil relationship that lies at the heart of the educational process” (p. 39). Merchant (2009) points out that there is resistance to valuing literacy in virtual environments because it is suggested that immersive worlds may be distracting and lead to loss of focus. However, according to Merchant immersive environments can be highly engaging, and may result in powerful learning situations (p. 43). The argument as to whether engagement in virtual environments is good or bad is less fruitful than the layered approach to research suggested by Merchant (2009). He demonstrates that

the virtual world involves the architecture of the virtual environment itself, requiring an understanding of how participants make meaning within the virtual world, and of both the social reality that participants live in on a day-to-day basis and the social realities of the virtual world.

Further complicating the phenomenon of literacy in virtual environments is the way digital tools permit the transcendence of space and time, supporting the development of identities that are informed simultaneously by the global and the local (Lam, 2009). Research into literacy in virtual environments therefore has to consider not only how language and literacy is developed and used, but also how language and literacy use contributes to the construction of the users' identities and their membership of affinity groups within virtual environments, and how those identities transcend local and global boundaries.

Transglobal Identity Construction and Affinity Group Membership

Within New Literacy Studies, identity is seen as being performed within social groups rather than as a stable construct (Black, 2006). Drawing on Gee's (1999) concept of Discourse as ways of being and using language and literacy, New Literacy Studies understands that what marks an individual as a member, or not a member, of particular groups is how they use language and literacy. Furthermore, since identity is enacted within groups, it is seen as fluid, changeable, and recursive (Black, 2006). Groups can be built around ethnic and racial categories, but can also be based on affinities or shared interests (Gee, 2003). For example, people engaged in a particular game, virtual world, or immersive environment may form an affinity group around the game or particular task they are working to complete. Youth engaged in fan fiction form affinity groups around the text that forms the basis of their fiction.

A significant body of research is revealing that engaging in online communities such as fanfiction, instant messaging and chat rooms, Web site creation, or immersive environments supports the emergence of new, bilingual or multilingual identities among second language learners. Through the use of virtual literacies, participants are able to transcend the limitations of geographic space, and maintain links to the language of origin while building an identity as bilingual/biliterate (Black, 2006), and creating translocal and transnational networks (Lam, 2009) in which participants perform language and cultural maintenance.

Engagement in virtual environments and online exchanges may also support the development of communicative and intercultural competence: Sykes, Oskoz, and Thorne (2008) suggest that synthetic immersive environments which combine aspects of virtual spaces such as *Second Life* with aspects of goal-directed gaming provide opportunities for inter-language development. They argue that, within these goal-directed immersive spaces, participants are able to develop an awareness of written language and visual expression as situated within linguistic and cultural conventions. Specifically, participants in virtual environments are able to interact with a wide variety of communicative norms and thus be socialized into appropriate language use across a variety of norms. According to Sykes et al. (2008), the socialization experienced by the participants occurs through simulated roles and identities in which participants are able to experiment with and practice pragmatic functions, experience an emotional connection to virtual action, and engage in authentic and low-risk practice of language skills. The authors warn, however, that these experiences within virtual worlds may not necessarily transfer into the physical world.

Similarly, Diehl and Prins (2008) found that participation in *Second Life* enhanced what they refer to as "intercultural literacy." This includes the use of multiple languages, cross-cultural encounters, increased awareness of cultural perspectives and openness toward new perspectives. Diehl and Prins (2008) also suggest that engagement in environments

such as *Second Life* challenges a homogeneous model of standard English and raises questions as to whether nonstandard English use may become more accepted as individuals encounter variations of English and the multiplicity of World Englishes.

Language Change

Virtual environments and the related fields of texting, instant messaging, and online chatting have been a rich area of inquiry into how language is used and develops. Since online exchanges often occur synchronously or in real time, online text often resembles conversation in structure and is frequently less formal than what the general public considers an acceptable standard of writing (Jacobs, 2008). Merchant (2001) argues that young people, as they engage in digital literacies, are changing the face of literacies and these new skills are important for success in the labor market.

The issue of writing skills in relation to the emergence of digital technologies has been well studied. Baron (1984) first raised the question of whether computer-mediated communication is a force in language change, and since then numerous researchers have worked to identify online language and literacy practices and their relation to writing. Research into instant messaging and texting reveals that despite the persistent belief that the truncated forms associated with online writing are damaging young people's ability to write, few of those practices actually appear in adolescents' and college students' writing (Jacobs, 2008; Drouin & Davis, 2009). Although the debate continues around the possible effects of online literacies on traditional writing skills, the growing body of research indicates that engagement in online literacies supports writing development.

Language Play

Other researchers have come to understand the differences between online literacy practices and traditional literacy forms by using the concept of play as a framework. De Freitas (2006) points out the voluntary nature of playing or gaming online. According to de Freitas, games are "a voluntary activity, separate from the real life, creating an imaginary or immersive world. Games are played out within a specific time and place, according to established rules, and create social groups out of the players" (p. 344). In both gaming and virtual worlds, de Freitas suggests, participants learn through exploratory behavior, and by making connections between what they know from their offline life and what is going on in the virtual world. This extends to literacy practices.

Warner (2004) proposed that a large portion of online language does not fit standard referential definitions of communication, but instead is playful in nature. Play, Warner argues, is a primary focus of language in forms such as poetry, rap, and puns, and language play is also important in the creation of alternative realities. In online exchanges, Warner found that participants played with the form of words, the content or concept under discussion, and the frame or "metalinguistic level." This metalinguistic level, according to Warner, is where the participants use their knowledge of the virtual nature of the setting to create playful exchanges. Understanding literacy in virtual environments through the lens of play also provides insight into the willingness of participants to take risks, which provides increased opportunities for learning (Salen, 2007; Lam, 2009).

Along the same lines, Salen (2007) argues that engagement in game design exposes participants to "flexible rules sets and iterative play" (p. 307), and includes a "stance of playfulness" (Lemke, 2006, as cited in Salen, 2007, p. 307), which is creative, improvisational, subversive, and performative. Salen suggests that these skills are critical for literacy in the 21st century. She also claims that the roles people take up within the world of

gaming are different than those taken up within traditional compositional activities. For example, within a game participants take up the role of producer; players design games, write game reviews, modify game components, and produce knowledge about how to play the games, the rules of the games, and the design of the games they create. Salen suggests that participants become active creators of online environments, whether they are textual or graphic in nature. She warns, however, that production is not a requirement of participation. Participation can include reading, writing, critical thinking, problem-solving, negotiation of complex economies, and programming. She therefore sees production as not just about content creation within a gaming environment, but also about the development of knowledge, relationships, and skills that accompany the game.

Conclusion

Insights into literacy in virtual environments are in the process of being formed, and will continue to shift as the shape of online environments change. Virtual environments encompass a wide range of literacy practices; which practices people engage in and how they engage in those practices depend upon the context of individuals' lives. For second-language learners, literacy in virtual environments supports the learning of new language skills, and also the development of new identities that transcend the local. For adolescents, literacy in virtual environments can be a subversive activity where existing norms of textual engagement are challenged and reshaped. Literacy in virtual environments also reawakens the learner and the teacher to the nature of play in human development. Literacy in virtual environments is a complex interaction of typographic text, audio, video, graphics, and hyperlinks that ultimately changes the relationship between the text on one hand, and the reader and writer on the other.

Literacy: Mixed Methods

ELIZABETH (BETSY) A. BAKER

The purpose of this entry is to briefly describe a study for which mixed methods were best suited. This study examined the growth of two groups of preservice literacy teachers in their abilities to recognize salient features of children's reading development. Quantitative data were used to ascertain growth, while qualitative data were used to situate the learning experiences in which this growth occurred. A purely quantitative study could have revealed growth but little would be known about how that growth occurred. A purely qualitative study could have provided a rich description of two different ways to implement case-based instruction but would not provide information about the growth of the learners. A mixed design helped to account for both growth of the learners and an understanding of the interventions experienced by each group of learners.

Rationale

Experts are those who achieve a high level of skill or knowledge. Experts are valued for their ability to make sense of a situation and make effective decisions. Researchers have explored characteristics shared among experts and consistently found that experts have the ability to "chunk" complex information into salient patterns. For example, expert chess players are able to look at a chessboard and instead of seeing 32 (or fewer) separate chess pieces they see patterns. They are able to make sense of the situation based on the recognition of these patterns and thereby make effective decisions about what chess piece to move next (deGroot, 1965). It is the ability to see these patterns that enables experts to make sense of complex information. Similar abilities have been found with, among others, expert architects, physicians, baseball players, physicists, electronics technicians, and teachers (Berliner, 1986; Bransford, Franks, Vye, & Sherwood, 1989; Chase & Simon, 1973; Egan & Schwartz, 1979).

Expert literacy teachers are able to recognize salient patterns as they listen to elementary children orally read and discuss their readings (Goodman, 1985; Clay, 1993). For example, through observation and discussion, expert teachers can ascertain information regarding students' (a) competencies and confusions, (b) strengths and weaknesses, (c) processes and strategies, and (d) understandings of literacy processes. Expert teachers regularly record and use these observations to determine developmentally appropriate instructional plans that meet the needs of each student (Bruner, 1978).

Teacher educators seek ways to develop expertise among preservice teachers. One such method being used is case-based instruction (Christensen, 1987; Shulman, 1992). Instead of teaching preservice teachers about a range of topics in a linear sequence, preservice teachers study cases of children, situations, and classrooms. They discuss what is salient in each case. They are encouraged to identify patterns. The purpose of this entry is to describe a study for which mixed methods were used to understand the development of pattern recognition among preservice literacy teachers who were enrolled in two sections of the same course. One section (N=26) was given *video-based cases* of children reading while the other group (N=23) was given *multimedia-based cases* of the same children reading the same passages. Multimedia included an interface that gave users access to the same

2 LITERACY: MIXED METHODS

video segments as the other group, corresponding copies of the books the children read in the videos, corresponding copies of the compositions the children wrote in the videos, and short scenarios that told the users what was occurring in the video segment. The methodological task was to account for the pattern recognition of each group of preservice teachers before and after they spent a semester designed to help them develop pattern recognition. The guiding research questions were:

- What contexts provide support for novice teachers to develop pattern recognition of children's reading abilities?
- Did the video-based/multimedia-based case users develop pattern recognition of children's reading abilities?
- Did the pretest and posttest measures indicate statistically significant growth in their abilities to recognize patterns?

To address these questions sequential mixed methods were used (Tashakkori & Teddlie, 2003; Creswell, 2009).

Examining Preservice Teachers' Development: Data Collection and Analysis

First, to conduct this sequential mixed-methods study (Tashakkori & Teddlie, 2003; Creswell, 2009) pattern recognition of literacy experts was operationalized. Using research regarding components of the reading process, miscue analysis, and formative assessment (Goodman, 1985; Clay, 1993; Ruddell & Unrau, 2004) it was determined that expert literacy teachers incorporate the following traits to recognize salient patterns. One, they consistently examine students' proficiencies regarding the following seven *components* of reading: graphophonemics, syntax, semantics, pragmatics, affect, automaticity, and metacognition. Two, expert literacy teachers take note of students' struggles and successes. Herein, expert teachers examine the entire *range* of literacy components—not just the components with which a student struggles or just the components with which a student is proficient. Three, experts substantiate the patterns they see. An expert teacher does not simply observe and conclude, for example, that a student proficiently decodes by recognizing prefixes without being able to cite examples. In summary, expert pattern recognition, for the purposes of this study included (a) seven components of reading, (b) the entire range of these components, and (c) the ability to substantiate observations of these components.

Next, pretests and posttests were developed. These tests were designed to measure how well preservice teachers recognized the components of reading, how well they observed the entire range of components, and how well they substantiated their observations. The pretest and posttest involved watching the same 13-minute video of a first-grade child orally reading a story to the teacher. The child looked at all of the illustrations in the book, predicted what the book might be about, and read the book aloud to the teacher. When the child got stuck on words the teacher asked him about his word attack strategies and occasionally told him words he did not know. After viewing the video, the participants responded in writing to the question "What do you notice about the child's reading?" The participants had no time limit for their responses. Herein, qualitative data were collected that consisted of written answers to an open-ended question.

Using qualitative typological analyses (LeCompte & Preissle, 1993; Hatch, 2002), the written answers were broken into discrete data units that were tallied and computed into frequency counts. Typological analysis refers to coding qualitative data according to an a priori scoring guide. For this study, the a priori guide consisted of the seven components of reading. In addition, to assure that discrete data were counted only once, data were

coded as either a statement or substantiation. Statements were defined as global or general statements that indicated recognition of a component of reading. For instance, "He used the letters to sound out words," was categorized as a statement about graphophonemics. Substantiations were defined as references to a specific skill representative of a particular component of reading. For example, "He did not know the short sound of /u/," was categorized as a substantiation of a child's graphophonemic abilities.

Two researchers independently coded the pretests and posttests. Next, the researchers compared their coding. Then, each discrepancy was reviewed until agreement regarding coding consistency was reached. Throughout this review, the researchers refined classification characteristics for each component of reading. When 100% interrater agreement was reached, frequencies and percentages were computed for each group's pretest and posttest for total number of statements made and total number of substantiations made.

In correspondence with the research questions, measures A, B, C, and D were created (see Table 1). Measure A referred to the number of reading components that each preservice teacher cited in a pretest or posttest. Because there were seven components of reading, for measure A, a participant could score between zero and seven. For example, Susan (pseudonyms are used for all participants) made six statements. However, these statements addressed only three of the seven components of reading. Thus, for measure A, Susan scored three. It is possible that the child Susan was watching did not do anything to demonstrate his abilities in the other four components of reading, hence Susan's omissions. In the operationalization of terms, however, expert teachers were defined as having the ability to take note of what a child does and does not demonstrate (Wilde, 1996). Susan only noted what the child did; she neglected to take note of what the child did not do.

Table 1 Research questions, measures analyzed, and examples of scoring

<i>Research questions</i>	<i>Measures analyzed</i>	<i>Cases of scoring</i>
1. Did the multimedia-users and video-users observe a range of aspects of reading (adapted from Leu & Kinzer, 1999) on pretest and posttest measures?	A: Number of aspects of reading (adapted from Leu & Kinzer, 1999) a participant's statements represented.	Case A: Sally identified 3 aspects of reading (decoding, semantic, and syntactic), Tom identified 4 aspects of reading (decoding, semantic, syntactic, and pragmatic).
2. Did the multimedia-users and video-users substantiate their pretest/posttest observations?	B: Number of examples a participant cited.	Case B: Sally cited 5 examples, Tom cited 17 examples.
3. Did the multimedia-users and video-users describe an "overall" understanding of a child's reading abilities?	C: A + B.	Case C: Sally scored 8 (3 aspects + 5 examples), Tom scored 21 (4 aspects + 17 examples).
4. Did statistically significant differences exist between pretest and posttest measures for multimedia-users? video-users?	D: Total number of statements a participant made + total number of examples a participant cited.	Case D: Sally's score was 11 because she made 6 statements and cited 5 examples. Tom's score was 31 because he made 14 statements and cited 17 examples.

Measure B referred to the number of substantiations, or examples, the participants made to “back up” their observations. The seven components of reading overlap; thus, measure B substantiations were counted once so that statistical assumptions of independence would not be violated. For example, students are expected to develop automaticity of graphophonemics, syntax, semantics, and pragmatics. The same is true of metacognition and affect. To address this methodological quandary, in such cases it was decided to code for only cueing systems (graphophonemics, semantics, syntax, and pragmatics). In this way, substantiations were counted only once.

Measure C referred to the participants’ overall pattern recognition and therefore combined measure A (range) and measure B (substantiation). Analysis of this measure was conducted to address whether statistically significant change in pretest and posttest scores occurred in combined scores. While significance may be evident in separate A and B scores, they may not be significant when combined. Conversely, significance may not occur in separate measures but become evident when they are combined. The combined scores were considered because it is preferred that a teacher demonstrate the abilities represented in measure A (range of reading abilities) as well as measure B (cite examples)—rather than one measure or the other. Measure C provided insights into these combined abilities.

Measure D referred to the total number of both statements the participants made as well as the number of examples a participant cited.

To analyze whether the preservice teachers made statistically significant growth, the frequency counts for measures A, B, and C were converted to *z* scores and then two-tailed *t* tests were computed to determine whether or not significant differences existed between pretest and posttest performance. The .05 level was adopted as the measure of significance, but it was not adjusted for multiple comparisons. Analyses were done within each group, because in naturally occurring educational settings (students randomly assigned to sections of a university course) creating control groups was not feasible. To display the differences in growth for each group, we computed change scores (posttest—pretest) for each of the four measures.

The results showed that the video-case group demonstrated a statistically significant difference between pretest and posttest for measure A only (see Table 2). The multimedia-case group demonstrated statistically significant growth from their pretest to their posttest

Table 2 Change between pretest and posttest for multimedia and video-users on measures A, B, C, and D

<i>Change measures</i>	<i>Minimum raw score</i>	<i>Maximum</i>	<i>Mean</i>	<i>Standard deviation</i>	<i>p value</i>
Multimedia-users (n=23)					
A	–1	4	1.09	1.41	3.69*
B	–3	10	2.17	3.23	3.23*
C	–4	9	3.26	3.12	5.10*
D	–4	11	4.13	3.62	5.18*
Video-users (n=26)					
A	–3	3	.38	1.55	2.63*
B	–6	5	–.62	2.04	–1.55*
C	–7	5	–.31	2.74	.54
D	–13	7	–.85	4.23	–1.02

* *p* < .05

on all four measures (A, B, C, and D). In other words, while the video-case users demonstrated growth in their ability to recognize all seven components of reading, the multimedia-case users demonstrated growth in their ability to recognize all components of reading as well as substantiate their observations. Thus, the multimedia-case group appeared to grow in their development of expert pattern recognition more so than the video-case group.

The inability to make direct group comparisons highlights the usefulness of a mixed-methods design. Specifically, growth measures combined with contextual data were fundamental to addressing the research questions. One without the other would provide an incomplete understanding of preservice teachers' growth while using either multimedia cases or video-based cases. Still, these quantitative measures were insufficient to address the research questions.

Making Sense of the Findings: Additional Qualitative Data

To make sense of the findings, data collection and analysis also accounted for how case-based instruction was implemented in each section. Naturalistic data collection and analysis methods were used (Lincoln & Guba, 1985; Corbin & Strauss, 2008). Specifically, each class session was video recorded for both sections (N=45 hours/section). Based on observations and revisiting video recordings, a data collection unit (DCU) was defined in terms of when case-based instruction was implemented. The DCU was used to focus analysis such that representative descriptions of each section were generated.

In both sections, students generated artifacts regarding their observations of case materials. These artifacts were collected. In both sections, instructors generated syllabi, lesson plans, and reflections regarding their implementation of case-based instruction. Data collection of observations, video recordings, and artifacts were triangulated. Negative case analyses identified anomalies that were used to refine descriptions with the end result being a description of how case-based instruction was implemented in each section. This description is too extensive to include here but it is available in other reports (see Baker, 2005, 2009; Baker & Wedman, 2007).

Concluding Remarks About Mixed Design

There are many kinds of mixed designs (e.g., Tashakkori & Teddlie, 2003; Creswell, 2009). This study used sequential mixed methods. Specifically, this study examined preservice teachers' growth while also accounting for pedagogical implementation of case-based instruction. In terms of sequence, this study first collected pretest data. Next, this study collected data regarding implementation of case-based instruction. Finally, this study collected posttest data. Qualitative and quantitative data were collected and analyzed to make sense of preservice teachers' growth. Qualitative data were collected to situate the findings by describing the implementation of case-based instruction in each section. For the purposes of this study, qualitative or quantitative data alone were insufficient. Examining preservice teachers' growth without accounting for the intervention was insufficient. Describing implementation of video-based cases and multimedia-based cases was insufficient. The use of both qualitative and quantitative methods provided the data necessary to address the posed research questions.

Literary Translation

REINE MEYLAERTS

Literary Translation: A Definition

"Time has come for a systematic reconsideration of the entire question of literature and translation," Lambert wrote in 1991 (Lambert, 1991, p. 33). Indeed, "to the extent that literatures . . . are tied to particular languages, they have all developed, at least in part, with the aid of literary exchange via translations" (Lambert, 1998, p. 131). The European national canons are in an important way based on the import, via translation, of Latin and Greek models; Shakespeare conquered the European continent via French translations, serving at their turn as a source for translations in other languages; German Romanticism gave translation a key role in the construction of a national German literature, and so forth.

Whatever these examples may suggest, literary translation is of course not restricted to the Western world. Moreover, any attempt to provide a definition of the phenomenon has to deal with the historical and contextual variability of both concepts, literature and translation. What is seen as literature varies through different cultures (e.g., Western vs. non-Western) as well as through history (medieval English literary culture is fundamentally different from twentieth-century literature in English). Accordingly, the concept of translation is time- and culture-bound and is closely tied with the concept and the status of the so-called original. Almost everything written in the medieval period would be considered as a translation in the modern sense of the word whereas at the time the label was often not used. Today, different labels—"translation," "adaptation," "rewriting," and so on—continue to coexist and overlap partially. In his influential "On Linguistic Aspects of Translation," Roman Jakobson described interlingual translation or "translation proper" as "an interpretation of verbal signs by means of some other language" (1959, p. 139). Literary translation then has traditionally been conceptualized as the complete transposition of an original literary text A—written in a language A—into a literary text B, written in a language B for a new target audience B. This definition also implied a view on translation as transfer between geographically and linguistically distinct literatures with different readerships.

Literature and translation being time- and culture-bound concepts, static, essentialistic definitions are altogether ineffective when it comes to a scholarly approach to literary translation. G. Toury therefore most radically opted for an open and functional definition. He "undefined" translation (Delabastita, 2010) in its historical and contextual variability as "assumed translation": everything which is "presented or regarded as such within the target culture on whatever grounds" (Toury, 1995, p. 32). In principle, literary translation can thus refer to "the translation of texts which are regarded as literary in the *source culture*: in an extreme formulation . . . *any translation* of such texts" and "the translation of a text (in principle at least, *any* text, of any type whatever) in such a way that the product be acceptable as literary to the *recipient culture*" (Toury, 1995, p. 168; emphasis in original). Radically inclusive, this definition has opened up new research interests, for example for pseudo-translations. Texts that are presented as translations and texts that function as translations but without relying on any identifiable source text often had immense influence in literature. Famous examples are Cervantes' *Don Quixote* or Macpherson's Ossian translation (see also Toury, 1995, pp. 4–53).

Literary Translation: Research Models

Scholarly attention to literary translation only began in the late 1960s and early 1970s. Before, the study of translation was part of linguistics and literary translation had been the object of linguistic analyses or contrastive stylistics (Vinay & Darbelnet, 1958), focusing on word- and sentence level and on issues of linguistic or stylistic equivalence with the source text. The original instead of the translation was the primary focus of attention and the ultimate normative standard.

It was J. S. Holmes, lecturer at the Literary Studies Department in Amsterdam, who at the Third International Congress of Applied Linguistics (Copenhagen, 1972) presented his groundbreaking paper "The Name and Nature of Translation Studies." A talented literary translator himself, Holmes urged for closing the gap between the theory and practice of literary translation and for "meta-reflection on the nature of translation studies" (Holmes, 1988, p. 71). Translation Studies should therefore become an empirical (descriptive and explanatory) science. From its inception the discipline was thus primarily focusing on literary translation but as a prototype of translation generally, without excluding other types of translation.

Holmes was in close contact with scholars from Tel Aviv and Leuven who shared his skepticism toward normative, linguistic models for the study of literary translation. For Even-Zohar's polysystem theory, translated literature is not just a derivative, secondary form of literature but functions as a genuine system within the larger literary system of the target culture. The function and position of translated literature within the receiving system depends on the state and status of the latter. If the target literature is young, peripheral, or in crisis, translated literature is likely to occupy a primary position: "it participates actively in shaping the centre of the polysystem" (Even-Zohar, 1978, p. 120). Translations then tend to closely follow the source texts and introduce new models, new genres, new styles into the target literature. The "normal" position of translated literature is, however, a secondary one according to Even-Zohar: translations tend to adhere to existing target literary models instead of introducing novelties.

Polysystem theory laid the basis for the development by Toury of Descriptive Translation Studies (DTS), a general theory of translation but with strong focus on literary translation. In the late 1970s, DTS caused a Copernican revolution in a field which had been until then mainly source-oriented, application-driven, and linguistically oriented (Toury, 1995, p. 24). Instead, Toury sought a theory that was target-oriented, descriptive-explanatory, and that could account for translation in its various and variable historical and contextual settings. Central in his model is the concept of norms: "the translation of general values or ideas shared by a community—as to what is right or wrong, adequate or inadequate—into performance instructions appropriate for and applicable to particular situations" (Toury, 1995, p. 55). The analysis of translational norms (in translated texts and in translators' prefaces, footnotes, manuals) and the analysis of their historical and contextual variability gives insight into the dynamic position and function of translated literature in the target system. Translational norms operate at every stage of the translation process. The initial norm governs the basic distinction between an adequate versus an acceptable translation: in the former case, the translation follows as closely as possible the source text norms whereas in the latter case the translator adheres to the norms of the target culture. Preliminary norms have to do with translation policy (the selection of texts: specific source literatures, genres, authors, etc.) and with the directness of translation (whether or not intermediate translation is tolerated). Operational norms, governing the translator's decisions during the translation process, shape the matrix of the translated text (matricial norms), that is, "omissions, additions, changes of location and manipulations of segmentation" and the "selection of material to formulate the target text in" (Toury, 1995, p. 59).

(textual linguistic norms). Translational norms govern “the (type and extent of) equivalence manifested by actual translations” (Toury, 1995, p. 61). Equivalence is no longer referring to the closest possible relationship with the source text but to any relation between source and target text as a result of time- and context-bound translational norms. It thus changes “from an ahistorical, largely prescriptive concept to a historical one” (Toury, 1995, p. 61).

From the 1970s onward, Toury, Even-Zohar, and Holmes were also in close contact with S. Bassnett (the only woman in the group, based in the UK), J. Lambert, R. van Gorp, A. Lefevere, T. Hermans, and R. van den Broeck in the Low Countries. Their gathering at the 1976 Leuven Conference “Literature and Translation” (Holmes, Lambert, & van den Broeck, 1978) gave further impetus and international visibility to DTS. About a decade later, the group’s key publication *The Manipulation of Literature: Studies in Literary Translation*, devoted to “the place and role of translations both within a given literature and in the interaction between literatures” (Hermans, 1985, p. 11), gave its name to the so-called Manipulation Group. In sum, “the temporary association of Holmes, Lambert, Toury and their fellows in a range of projects (conferences, books) in the 1970s and early 1980s had an electrifying effect which contributed to putting Translation Studies on the academic agenda as a ‘new’ discipline to be reckoned with” (Delabastita, 2010).

In the late 1980s, Bassnett and Lefevere initiated the so-called “cultural turn.” The expression was launched in their introduction to *Translation, History and Culture* (Bassnett & Lefevere, 1990) and had a clear programmatic value. Not language and comparisons between source and target texts but culture and the interaction between translation and culture should become the central focus in Translation Studies. Since the translated text had to be considered in its cultural, historical context, issues of power and ideology came to the fore. Recasting translation as rewriting, Bassnett and Lefevere emphasized how every translation reflects a certain ideology, for example through distortion of the original. Thus, “the study of the manipulation processes of literature as exemplified by translation can help us towards a greater awareness of the world in which we live” (Bassnett & Lefevere, 1992, p. vii). The “cultural turn” has most deeply marked research on literary translation and has had a long-lasting influence on the discipline. Denunciating the binary and implicitly hierarchical distinctions between original and translation, source and target, monolingual and multilingual, it took Translation Studies away from its structuralist roots (see also below; Meylaerts, in press).

Gender as a locus of power between different sexes was one of the categories that characterized Translation Studies’ cultural turn. *Gender in Translation: Cultural Identity and the Politics of Transmission* (Simon, 1996) criticizes Translation Studies for its sexist concepts of “dominance” and “faithfulness.” For feminist translation theorists the image of translation as a secondary activity and the submissiveness of the translator toward the author mirror the inferior status of women in society. Gender-based studies instead unveil the prominent role of many invisible women translators in history. As for the analysis of translation strategies, they focus “on the minute details of language that may reflect or conceal gendered aspects of language use” (von Flotow, 2010) as a means to give insight in the power mechanisms between men and women, between authors and translators in the target literature and culture.

Next to Gender, the cultural turn took shape through the study of postcolonial literatures. Postcolonial literature, written by people living in formerly colonized countries in the language of these colonizers, is commonly viewed as a form of translation. Postcolonial authors are “translated men” (Rushdie, 1991, p. 17, qtd. in Bandia, 2010), translating their local world in a hegemonic language or writing in a mixture of imported, ex-colonial European languages and local vernacular languages. These hybrid languages create translation effects in the text: disparate vocabulary, unusual syntax, code switching, calques, and so forth. They also raise complex power issues between the hegemonic and subaltern

languages, literatures, and cultures involved. Postcolonial writers feel often caught between identity and alterity, between loyalty and treachery toward the home culture. The reading act of these hybrid, multilingual texts corresponds to an ongoing translation process. For the sake of the monolingual reader, the foreignisms may be followed by in-text translations. Translation being *in* the text, not *in between* texts, and the “original” and its “translation” being present side by side in one and the same text, postcolonial literatures challenge the traditional definition of translation as the substitution of one language and one text by another (see above). They also blur the binary distinctions between original and translation, between monolingual and multilingual.

Research on the *translation* of postcolonial or, more generally, multilingual literary texts has gained ample attention from Translation Studies (Niranjana, 1992; Spivak, 1993; Meylaerts, 2010). For a long time, it remained associated with translation *problems* or even *untranslatability*. Whatever may be the problems of translating multilingual texts (that it is problematic is beyond dispute), this approach fails to do justice to the specificity of the phenomenon (basically *anything* can be a problem in translation and can be approached as such), and is, moreover, founded on the outdated postulate of perfect equivalence between “original” and “translation.” Eventually the translatable versus untranslatable dichotomy revives illusions of fidelity, authenticity, and understandability which have been discarded by postmodern philosophies of language. We do not fully understand texts, multilingual or not, translated or not. The analysis of multilingual literary texts in translation has the potential to lay bare some blind spots of Translation Studies’ models. Since these texts often embody the *tensions* between languages of different literary value and prestige within a multilingual culture, their translation may highlight multilingual cultures’ internal cleavages, their linguistic and identity conflicts. How multilingual can or has a translation to be in a certain context? What are the modalities and identity functions of literary multilingualism in literary translations (Meylaerts, 2006)? As far as these questions remain underrepresented in research, they exemplify Translation Studies’ idealizing monolingualism and reductive binarism (monolingual vs. multilingual) and point to future challenges for the discipline (see also below).

During the last decade, the study of literary translators, rather than translations, has led to the development of a sociology of translation (Wolf, 2010). Among other theories, Bourdieu’s field theory with its concept of habitus has complemented DTS’s textual orientation. In his seminal article “The Pivotal Status of the Translator’s Habitus,” the late D. Simeoni (1998) was the first to introduce the concept. Habitus refers to the individual’s mental and physical structures as shaped by early socialization within structures of family, class, and education. It is of primary importance for developing a sense of what is perceived as appropriate behavior, such as translating, in a certain context. Accordingly, since Simeoni (1998), Translation Studies scholars have investigated the social and biological trajectories of literary translators as a way to understand their translational behavior, perceptions, and beliefs (Gouanvic, 2005; Sela-Sheffy, 2005; Meylaerts, 2008, 2010). Interestingly, these studies have also made clear habitus’s monocultural character, too much limited to structures and actors that refer to national, monolingual societies only. By integrating the translators’ *intercultural* habitus in its framework, Translation Studies can offer a much-needed correction to Bourdieu’s theory, which is still more national than intercultural in nature (Meylaerts, 2005). This may turn habitus into an intercultural construct valid for translators in multilingual literatures and cultures.

Future Developments: Literary Translation Studies and Comparative Literature

Today's literatures are indeed no longer conceptualized as the juxtaposition of monolingual national literary spaces. Rather, multilingual literary productions share—or dispute—a common, multilingual space which is not exclusively bound by national territory. The analysis of the complex international, national, and local relationships between these literatures creates new conceptual and methodological challenges for comparative literature. Among the numerous pleas for a new comparative literature, literary translation studies occupy an important place. Still, the implementation of this new orientation is subject to divergent approaches. For some, the concept of “cultural translation” embodies the ethical ideal of “visibility of the other,” of emancipation of minority literatures, characteristic of the inclusive conception of the “new” comparative literature (Spivak, 2004). As far as these ethical concerns find their origin in the dominant cultures and are based on so-called Western concepts, critical reflections concerning their real emancipative power are certainly legitimate. For others, translation is a metaphorical concept of such elasticity that it becomes a void notion: “Cast as an act of love, and as a disruption, translation becomes a means of repositioning the subject in the world and in history” (Apter, 2006, p. 6).

Is Literary Translation Studies ready to become the new comparative literature of the 21st century? If so, it should shed the shadows of its ancient binary dialectics: national versus international, translated versus non-translated, monolingual versus multilingual, author versus translator. Multilingual cultures constitute enormous reservoirs of multiform and multilateral literary relations that question these binary oppositions. As already indicated, they give rise to multilingual, hybrid texts that contain translation in the text and that thus epitomize, on an *intra*-textual level, today's complex literary relations. They thus question the idealizing monolingualism of traditional translational models and clear-cut distinctions between monolingual and multilingual. Moreover, as far as in multilingual cultures the idea of a *geographical transfer* of translations is rather virtual—translated texts and originals share a common space (Meylaerts, 2004)—the distinction between source and target literatures may lose part of its analytical pertinence. Due to the relativity of territory as distinctive cultural feature, translations, both as a process and as a product, may also belong to the source culture. The latter may intervene at the level of the initial norm, the preliminary and operational norms. In short, pointing to zones of overlap between so-called “source” and “target” literatures, translation in multilingual cultures discusses one of the key postulates of Descriptive Translation Studies: “translations are facts of the target culture” (Toury, 1995, p. 29). From the point of view of the actors, finally, in multilingual cultures the roles of translator and writer are increasingly coinciding in the same subject. As a consequence, literary self-translation was recently put on the research agenda (Hokenson & Munson, 2007).

All these developments illustrate the need for new, flexible, and inclusive definitions of literary translation, taking into account the blurred distinctions between “source” and “target,” monolingual and multilingual, original and translation, author and translator. It is only on these conditions that Translation Studies may become the new Comp Lit of the 21st century.

Long, Michael H.

LOURDES ORTEGA

Michael H. Long, among the most important figures in the field of second language acquisition (SLA), is best known as the originator of the interaction hypothesis in the 1980s and the focus-on-form principle of second language (L2) instruction in the early 1990s. Over 30 years, his ideas have been deeply influential in the development and consolidation of these and other research programs in SLA, including work on task-based language teaching, critical periods and fossilization, and research methods and epistemologies in SLA.

Born in England, Long's first degree was a bachelor of laws from the University of Birmingham. After volunteer work in Peru, he began his training in applied linguistics at the University of London's Institute of Education and at the University of Essex, where he received a postgraduate certificate in education and a master of arts in linguistics with a specialization in applied linguistics. He then spent a few years as a teacher of English as a foreign language (EFL) and teacher trainer in England and Mexico. Through his international experiences he became a highly proficient speaker of Spanish, a competency he has maintained and which enables him to lecture about SLA in Spanish. Dating from those formative professional years are also some EFL textbooks and his first academic publications in the well-known *On TESOL* book series. The themes found in this early work foreshadowed his sustained interest in investigating interfaces between SLA and language teaching.

After a year teaching at Concordia University's TESL Centre in Montreal, Long moved to the United States in 1977, where he has remained ever since, without renouncing his British citizenship. He completed his PhD in applied linguistics under Evelyn Hatch at the University of California, Los Angeles and spent the first two years of his academic career at the University of Pennsylvania. There he was mentor to Teresa Pica, who became another key contributor to research on interaction. He joined the University of Hawai'i in 1982 and became a full professor in 1990. Together with such colleagues as Robert Bley-Vroman, Craig Chaudron, Charlene Sato, and Richard Schmidt, he made the University of Hawai'i a leading center of SLA and classroom research. After 21 years in Hawaii, he moved to the University of Maryland in 2003 to take up the position of director of the newly formed School of Languages, Literatures, and Cultures, where he is currently professor of second language acquisition.

Long's first major contribution to SLA was the interaction hypothesis, which originated in his 1980 doctoral dissertation, published in abridged form in Long (1981, 1983) and updated 15 years later in Long (1996). This was the first systematic study of negotiation of meaning arising during oral interactions by dyads of ESL (English as a second language) students and teachers. The findings led Long to critically modify Krashen's comprehensible input hypothesis, expanding on Evelyn Hatch's insight that conversation is a site for language development. In a nutshell, he posited that language learning is supported in psycholinguistically nontrivial ways by certain conversational adjustments that occur during face-to-face oral interactions with more linguistically mature interlocutors. Whenever anticipated, perceived, or actual breakdowns in communication are negotiated by both parties, interlocutors will use comprehension checks (*do you want me to repeat?*), confirmation checks (*you mean the university closes at 8 pm?*), clarification requests (*pardon me?*), and a variety of other strategies and tactics for avoiding and repairing conversational trouble

and increasing mutual intelligibility. Long was the first to suggest that these conversational adjustments generate learner-contingent, and thus optimal, comprehensible input (Long, 1983). Furthermore, Long (1996) noted that conversational adjustments resulting from efforts at negotiating meaning make new language form perceptually more salient while offering much positive and negative evidence for what is possible and impossible in a given grammar. All of this in turn stimulates attentional processes, such as detection, noticing (Schmidt, 2001), and hypothesis testing, which are thought to lead to learning benefits. The claims of the interaction hypothesis have been largely supported (Keck, Iberri-Shea, Tracy-Ventura, & Wa-Mbaleka, 2006; Mackey & Goo, 2007). Within interaction, Long also initiated the currently much developed area of research on L2 recasts, first by mentoring the first descriptive studies of this phenomenon by Oliver (1995) and others, and later by publishing the first quasi-experimental laboratory studies of recasts (Long, Inagaki, & Ortega, 1998).

A second major contribution in the early 1990s was Long's proposal of the focus-on-form principle of L2 instruction (Long, 1991; Long & Robinson, 1998). He claimed that attention to new language forms and form-meaning connections is most beneficial if it occurs briefly and incidentally without interrupting meaning-focused language processing. According to Long, therefore, teaching approaches that draw on focus on form are psycholinguistically superior to approaches that maintain an exclusive focus on forms, *per se*, or on meaning alone. Long's ideas on focus on form, as well as interaction, naturally led him to propose task-based language teaching (TBLT) as a promising curricular approach to language education (e.g., Long & Crookes, 1992). His particular view of TBLT is characterized by: (a) the importance attached to expert analysis of learner needs as the foundation for any task-based curriculum (Long, 2005a); (b) the provision of a curricular framework articulated around the sequencing of pedagogical tasks along cognitive parameters, so as to ease students into managing real-world target tasks in an L2; (c) the design of input- and interaction-rich task-based materials that generate contextually appropriate focus-on-form opportunities; (d) deployment of 10 methodological principles for language teaching (Long, 2009); and (e) the use of task-based, criterion-referenced performance testing (Long & Norris, 2000).

The areas of interaction, focus on form, and TBLT described above cohere around Long's strong interest in producing SLA findings that can support language teaching. His work has been equally invested in examining SLA topics through the lenses of cognitive science (Long & Doughty, 2003). He has been influential in debates about the role of age in learning a second language. An early contribution was the insight that age effects are complex because older learners develop faster in the short term, but younger starters do better in the long run, that is, if evidence is inspected after five or more years of learning (Krashen, Scarcella, & Long, 1979). Consequently, he suggested that the field invest in research programs that focus on the limits of what can be learned, or what is possible in ultimate attainment, as well as on rate or interim attainment (Long, 1990b). Based on a review of the literature and his own longitudinal data, Long (2003) expressed skepticism about the available empirical evidence for fossilization and noted problems with the idea for SLA theory, arguing that stabilization may be a more workable construct. He has also maintained that the data are consistent with the hypothesized existence of sensitive periods for SLA (Long, 2005b). Specifically, he posits that there exist maturational constraints on what can be achieved in three different linguistic domains (phonology; lexis and collocations; and morphology and syntax) when second language learning starts after certain ages (Granena & Long, 2010). In his view, L2 development can wax and wane without learning necessarily ever ceasing if opportunities for input and use are available; however, ultimate attainment is limited by human biology.

Also motivated by Long's vision of SLA as a field within cognitive science are his oft-cited publications discussing research methods and evaluating epistemologies in SLA.

His position in this regard is that of critical realism. Such work includes his discussion of the value of process methodologies when investigating classroom learning (e.g., Long, 1980), the already mentioned methodological critiques of studies of age effects and fossilization (Long, 1990b, 2003, 2005b), and the application of criteria from the history and philosophy of science to assess the relative merit of competing SLA theories (Long, 1990a, 1993; Gregg, Long, Jordan, & Beretta, 1997). Long's writing about methods and epistemologies has fueled debate that has moved the field forward. His vision for SLA as a field appears in a classic SLA textbook (Larsen-Freeman & Long, 1991) and in a book that addresses contemporary issues, including theory construction and evaluation (Long, 2007).

Long's service to the profession has been significant. During the 1980s, with Stephen Krashen and Robin Scarcella, he edited the first book series devoted to SLA, *Issues in Second Language Research*, published by Newbury House. In 1983, he became editor with then Hawai'i colleague Jack Richards of the highly respected *Cambridge Applied Linguistics Series*, a role he served uninterruptedly for 24 years. Long was also an editorial board member of *TESOL Quarterly* for most of the 1980s and of *Language Teaching Research* from the mid-1990s to the mid-2000s. He has been a member of the editorial board of *Studies in Second Language Acquisition* since 1985, and in 2011 also joined the editorial board of the new journal *Linguistic Approaches to Bilingualism*. Long has been a mentor to new generations of SLA researchers who now work in the USA, Australia, Japan, Korea, and Spain, among other countries. During his 21 years in Hawaii, he was instrumental in the establishment in 1988 of one of the earliest doctoral degrees in SLA. Since arriving at the University of Maryland, he has established and provided leadership for another new PhD program in SLA.

Long's extraordinary intellectual achievements have been recognized internationally with innumerable invitations and distinctions. He has been an invited plenary and keynote speaker at over 60 national and international conferences and has held visiting appointments in many countries, with repeated and consistent contributions particularly to the development of SLA research in the USA, Canada, Australia, Catalonia in Spain, Denmark, Japan, and China. Among the most important distinctions he has received are the TESOL/Newbury House International Research Award, a Mellon Fellowship, and a doctorate honoris causa from Stockholm University in 2009. Long's seminal contributions have led the way in theoretical development and innovation in contemporary SLA research.

Lyster, Roy

LEILA RANTA

Professor Roy Lyster (1956–) is a leading researcher in applied linguistics associated with the topic of corrective feedback, form-focused instruction, and the integration of language and content in content-based language instruction. Roy Lyster was born and raised in the city of Regina, in Saskatchewan, Canada. He completed his BA in 1979, and then his passion for the French language led him to leave the Canadian prairies to study in Paris. There he studied French literature with Julia Kristeva and completed a Master's thesis on the Québécois writer, Hubert Aquin. Returning to Canada in the early 1980s, he completed a teaching degree at the University of Toronto and spent about 10 years working as a French immersion teacher at the upper elementary level. This experience propelled Lyster to undertake graduate studies at the Ontario Institute for Studies in Education in Toronto. He had noticed that his students had difficulty speaking French in age-appropriate ways. His observations resonated with the findings from a large-scale study showing that immersion students differ from native speakers of French in their grammatical and sociolinguistic competence (Harley, Allen, Cummins, & Swain, 1990). His views about the French language errors of immersion students were published in his first article "Speaking Immersion" (Lyster, 1987), which led him to address the pedagogical implications in a subsequent article (Lyster, 1990) that won the Best Paper by a Graduate Student awarded by the *Canadian Modern Language Review*. For his doctoral research, Lyster (1994, 1996) sought to determine whether learners' oral and written production could become more socially appropriate through form-focused instruction. He found that making the rules for using *tu/vous* explicit significantly improved students' ability to perform different speech acts.

After completing his PhD, Roy Lyster was hired as a professor at McGill University in Montreal. There he embarked on a program of research on the topic of corrective feedback. This award-winning research agenda has received extensive support from provincial and national funding agencies. The resulting research reports have been published in all of the top peer-reviewed journals in applied linguistics including *Applied Linguistics*, *Language Learning*, and *Studies in Second Language Acquisition*.

The development of the research program on corrective feedback began in earnest with a seminal article published in *Studies in Second Language Acquisition* (Lyster & Ranta, 1997). The article proposed a conceptual framework for investigating teacher feedback on error in communicative classrooms that has been widely adopted by classroom researchers. The findings from their study of teacher–student interaction in elementary French immersion classes led the authors to question the value of using recasts (i.e., teacher's correct reformulation of the learner's error) since it was not clear that the learners noticed such implicit forms of feedback. This article was awarded the Paul Pimsleur Award for Foreign Language Research in 1998. In hindsight, it appears to have sparked a flurry of activity by other researchers who have sought to investigate the relationship between types of feedback and noticing, how teachers provide feedback in a wide range of instructional contexts, and the degree to which learners are able to benefit from feedback.

From the initial descriptive study of classroom teaching, Lyster (1998a, 1998b) carried out further analyses of the same transcripts used in the 1997 paper, identifying different patterns for different linguistic forms, and similar patterns in how teachers responded to

errors and non-errors. The ensuing phases in the research program have included both a classroom experiment (Lyster, 2004) and a laboratory study (Lyster & Izquierdo, 2009) focusing on grammatical gender in L2 French, and a meta-analysis of 15 classroom studies (Lyster & Saito, 2010). Although the early studies suggested an advantage for prompting as a feedback technique rather than reformulations, the findings from studies in settings other than French immersion (Panova & Lyster, 2002; Lyster & Mori, 2006; Yang & Lyster, 2010) have led Lyster to view the impact of different feedback moves as being dependent on the context. This contextual dimension has become an important theme in his most recent theorizing (Lyster & Mori, 2006; Lyster, 2007). In *Learning and Teaching Languages Through Content: A Counterbalanced Approach*, his book published in 2007, the program of research on feedback is placed within a broader pedagogical framework, referred to as counterbalanced instruction. This approach involves the systematic integration of both content-based and form-focused instructional options.

Despite a flirtation with postmodernism in his studies of literature, Lyster's research is firmly grounded in the cognitivist paradigm. Yet an important dimension of his work is that it is not only of interest to SLA theoreticians but also to practitioners. In addition to technical articles in scholarly journals, he has been committed to publishing accessible, teacher-friendly syntheses of this research, to collaborate with practitioners, and to disseminate his findings to preservice and in-service language educators locally and internationally. This engagement with the larger community can also be seen in the decision to serve as copresident then president of the *Canadian Association of Applied Linguistics* (known by its French acronym *ACL*) from 2004 to 2008. Together with Sharon Lapkin, Roy Lyster has done much to raise the profile of *ACL*, both nationally and internationally.

Language for Specific Purposes: Overview

THOMAS A. UPTON AND ULLA CONNOR

Language for specific purposes (LSP) is an area of applied linguistics that focuses on the analysis and teaching of language in order to meet *specific* language needs of non-native speakers of the language. These specific language needs may be academic (e.g., Chinese students preparing to study at a French university), vocational (e.g., Filipino immigrants working in service jobs in Hong Kong hotels), or professional (e.g., Japanese business people opening factories in the United States). LSP as a field of applied linguistics dates to the early 1960s and, according to John Swales (2000), gained traction with the publication of the book *The Linguistic Sciences and Language Teaching* by Halliday, Strevens, and McIntosh (1964).

As quoted by Swales (2000, p. 59), Halliday et al. wrote:

Only the merest fraction of investigation has yet been carried out into just what parts of a conventional course in English are needed by, let us say, power station engineers in India, or police inspectors in Nigeria; even less is known about precisely what extra specialized material is required.

This is one of the tasks for which linguistics must be called in. Every one of these specialized needs requires, before it can be met by appropriate teaching materials, detailed studies of restricted languages and special registers carried out on the basis of large samples of the language used by the particular persons concerned. (Halliday et al., 1964, pp. 189–90)

It is this passage, Swales argues, that provided the foundation for the field of LSP. From it, the following agenda for LSP analysis and instruction was established: (a) research into language use should be descriptive; (b) focus should be on the real language used by regular people (not famous or literary figures); (c) current, everyday language should be of primary importance; (d) language as it is spoken or written in specific contexts should be the focus of study (not “authorial motives for linguistic choices”); and (e) there should be an analysis of functional grammar along with the contextual factors that influence language use (Swales, 2000, pp. 59–60).

In this entry, we first provide some historical context—including the basis for the dominance of English in the LSP literature, a discussion on how LSP has been defined, and the traditional categories of LSP; we then overview the current key debates in the field of LSP. We conclude by looking at the relationship between research and instruction in LSP and highlight the need for new research approaches to capture better the real and changing language needs of LSP learners in increasingly complex political contexts. Our goal is to provide an overview to the field of LSP in general and introduce the themes for this area that are represented in the encyclopedia.

Language for Specific Purposes: English at the Forefront

The study of LSP can encompass any language used in the world; nevertheless, the vast majority of the language analysis and instruction that has been done in LSP has focused on English. Consequently, the terms English for specific purposes (ESP) and LSP are often used interchangeably, and much of the research and publications in LSP focus on ESP. This is reflected by the fact that the two leading journals in LSP are titled *English for Specific Purposes: An International Research Journal* and *Journal of English for Academic Purposes*. Swales (2000) acknowledges—and bemoans—this situation in his article reviewing the field of LSP in a section titled “English English Everywhere”: “One of the ironies of the emergent field of ESP is that its very success in catering to the needs of nonnative speakers has contributed to the overpowering position of English in today’s worlds of sciences, scholarship, and business” (p. 67). In an earlier article, Swales (1997) likened English in the realm of academia to a *Tyrannosaurus rex*, “a powerful carnivore gobbling up the other denizens of the academic linguistic grazing grounds” (p. 374).

This emphasis in LSP on the analysis and teaching of English can be seen in the entries that follow in the encyclopedia, as many of the titles specifically narrow the focus to English; the reason for this, however, is because in many cases English is by far the most prominent language that non-native speakers are wanting or needing to learn in particular contexts, for example, the entry titled MARITIME ENGLISH. The shipping trade, by definition, is global and even one shipment typically involves many countries, languages, and cultures. The entry gives the example of one ship that “was built in Spain, had a Norwegian owner, was registered in Cyprus, was managed from Glasgow, was chartered by a French company, had a Russian crew, was flying a Liberian flag, and carried American cargo.” In this international context, English is *the* common language of the high seas.

While French, German (see GERMAN FOR SPECIFIC PURPOSES), and Russian are also international languages that have been important in the field of LSP, Arabic in the eastern hemisphere and Spanish (see SPANISH FOR SPECIFIC PURPOSES) in the western hemisphere are now growing in importance as languages that non-native speakers of English are learning in order to communicate for specific purposes. And China, with its huge population and growth as both an economic and military powerhouse, will no doubt soon propel Chinese as a language of increasing focus of LSP scholarship and instruction, as noted in the entry LANGUAGE FOR SPECIFIC PURPOSES IN ASIA. The role of culture, as reflected in LANGUAGE FOR SPECIFIC PURPOSES IN EASTERN EUROPE and the other area and language-focused entries, is also an important consideration in the field of LSP as it is impossible to separate language from culture.

Toward a Definition of Language for Specific Purposes

Much of the theoretical foundation for LSP grew out of work in ESP. Early in the 1960s, linguists started coming to the realization that the language we use—both spoken and written—varies considerably from one context or purpose to another (Hutchinson & Waters, 1987). As a result, language instruction began to shift from teaching the grammatical structures and rules of English to teaching language as it is actually used in real life. As Hutchinson and Waters (1987) noted, this led to the development, in ESP for example, of courses for specific groups of learners, with courses focusing, for example, on the language of business or the language of science. “The idea was simple: if language varies from one situation of use to another, it should be possible to determine the [language] features of specific situations and then make these features the basis of the learners’ course” (Hutchinson & Waters, 1987, p. 7).

Also in the 1960s, educational psychologists began to realize that learners in general, including language learners, have different needs and interests, and that these differences influenced not only students' motivation to learn, but also the effectiveness of their learning (Ormond, 2010). This paradigm shift in the understanding of how learners learn has become a key feature of ESP; not only do we need to teach language as it is actually used in specific contexts, but the focus of the instruction should take into account learners' needs and interests within those specific contexts. In Basturkmen's (2006) words, it is essential that we understand the "conditions needed in order for language learning to take place" (p. 85).

Encompassing this new understanding of the variability of language as well as learners' interests and needs, Hutchinson and Waters (1987)—in one of the first books to provide a comprehensive overview of teaching, course design, syllabuses, materials, teaching methods, and evaluation procedures in ESP instruction—defined ESP as "an approach to language teaching which is directed by specific and apparent reasons for learning" (Hutchinson & Waters, 1987, p. 19). Much discussion ensued as to whether this definition was sufficient. While others (see, for example, Strevens, 1988; Robinson, 1991) offered their own definitions of ESP, it is Dudley-Evans and St. John's (1998) definition that is now the more widely quoted definition of ESP. Their definition, though, is not a simple one, as it is comprised of a set of both "absolute" and "variable" characteristics:

1. Absolute characteristics:
 - ESP is designed to meet specific needs of the learner;
 - ESP makes use of the underlying methodology and activities of the disciplines it serves;
 - ESP is centred on the language (grammar, lexis, register), skills, discourse and genres appropriate to these activities.
2. Variable characteristics:
 - ESP may be related to or designed for specific disciplines;
 - ESP may use, in specific situations, a different methodology from that of general English;
 - ESP is likely to be designed for adult learners, either at a tertiary level institution or in a professional work situation. It could, however, be used for learners at secondary school level;
 - ESP is generally designed for intermediate or advanced students. Most ESP courses assume basic knowledge of the language system, but it can be used with beginners. (Dudley-Evans & St. John, 1998, pp. 4–5)

At its core, the rationale for ESP, in the words of Belcher (2009), is the "motivation to help those especially disadvantaged by their lack of language needed for the situations they find themselves in, hope to enter, or eventually rise above" (p. 3).

Traditional Categories of LSP/ESP

The complexity of the definition offered by Dudley-Evans and St. John reflects the complexity of LSP in practice. As Belcher (2009, p. 2) notes, "There are, and no doubt will be, as many types of ESP as there are specific learner needs and target communities that learners wish to thrive in."

ESP has long been divided into two broad types: ENGLISH FOR ACADEMIC PURPOSES and ENGLISH FOR OCCUPATIONAL PURPOSES (Hutchinson & Waters, 1987; Johns & Dudley-Evans, 1991; Dudley-Evans & St. John, 1998; Belcher, 2009). English for academic purposes (EAP) is language instruction that focuses on the specific language and learning needs of learners

4 LANGUAGE FOR SPECIFIC PURPOSES: OVERVIEW

in instructional settings, usually at the postsecondary level but often at the secondary level as well. The emphasis in EAP courses is on academic language; for example, most EAP programs at the college level focus on the academic language skills needed for writing papers and reading textbooks. English for occupational purposes (EOP), on the other hand, focuses on the language needs of learners in occupational—professional or vocational—contexts. These sorts of purposes are reflected in the following entries in the encyclopedia: *ENGLISH FOR BUSINESS*, *ENGLISH FOR MEDICAL PURPOSES*, *ENGLISH FOR NURSING*, *AVIATION ENGLISH*, and *MARITIME ENGLISH*. Of course, there are many instances of ESP instruction that combines the focuses of both EAP and EOP; English for academic business purposes and English for academic legal purposes, which provide language instruction to students studying courses in business and law, respectively, represent two examples.

What all of these types of ESP/LSP courses have in common is the goal of giving “learners access to the language they want and need to accomplish their own academic or occupational goals” (Belcher, 2004, p. 166).

Current Issues in Language for Specific Purposes

The entry *HISTORICAL DEVELOPMENT OF LANGUAGE FOR SPECIFIC PURPOSES* provides important context for understanding the issues that are central to LSP today. As with any maturing field of inquiry, debates on key issues in LSP speak to the complexity as well as the promise of this area of applied linguistics.

The entry notes that some of the critique of LSP is due to the perception that it has been driven less by the goals of global communication and understanding and more by business and national interests (see also Benesch, 2001). This critique notwithstanding, there are three broad areas of debate regarding best practices in LSP. These focus on (a) the needs assessment process, (b) how specific the materials and teaching methods should be, and (c) what level of subject knowledge instructors must have to be effective (Belcher, 2006). The fact that these three areas of debate directly address core features of the most widely accepted definition of ESP that was given above reflects the importance of these discussions. Indeed, most of the entries in the LSP area of the encyclopedia touch on at least one of these issues.

Needs Assessment

The first “absolute characteristic” of ESP given in the definition provided earlier is that “ESP is designed to meet specific needs of the learner” (Dudley-Evans & St. John, 1998, p. 4). According to Johns (1991, p. 72),

ESP’s greatest contribution to language teaching has been its insistence upon careful and extensive needs and task analyses for curriculum design . . . Instead of guessing at student needs, ESP practitioners contend that we must constantly develop new techniques for examining the tasks students have to perform in English, for understanding the target situations in which they will operate, for analyzing the discourse of the target situations, and for determining student learning strategies.

LSP entries in the encyclopedia focus on some of the more common “specific purposes” for which language instruction has been targeted, including *ENGLISH FOR SCIENCE AND TECHNOLOGY*, *ENGLISH FOR ACADEMIC PURPOSES*, and *LANGUAGE FOR TOURISM*, among several others highlighted elsewhere in this entry. Each of these entries includes a discussion of some of the specific language needs that have been identified for learners in these

contexts. Reflecting this primary importance of needs assessment (or analysis) in LSP, an entry titled *NEEDS ANALYSIS AND SYLLABUS DESIGN FOR LANGUAGE FOR SPECIFIC PURPOSES*, is included in the encyclopedia. The entry notes some of the sociopolitical, educational, and methodological concerns that have been raised about the needs analysis process in recent years; it is in these areas where there is debate.

The crux of the debate focuses on the issue of “power” (Pennycook, 1997; Benesch, 2001; Belcher, 2006). Neither language nor pedagogy is neutral; they occur in and are influenced by social, cultural, and political contexts. The many players in any LSP situation operate in these contexts where power is unequal—between students and teachers, teachers and administrators, students and the wider social and cultural context. Is it sufficient to simply focus on the language structures and communicative competence required in particular discourse contexts, or do teachers also need to help students recognize the conflicting perspectives of “privileged members” (e.g., supervisors and teachers) and “novices” (e.g., employees and students)—as well as other race, class and gender relationships—and help them navigate, influence and even challenge those power relationships? The entry *CRITICAL ENGLISH FOR ACADEMIC PURPOSES* explores more broadly these power relationships within EAP; The entries *CULTURE AND LANGUAGE FOR SPECIFIC PURPOSES* and *INTERCULTURAL RHETORIC IN LANGUAGE FOR SPECIFIC PURPOSES* also explore the interpersonal and intercultural relationships that impact language instruction and learning, and the role of power, representation, and identity on LSP in general, including the identification of learner needs.

Benesch (2001) has previously argued that needs analysis should be re-visioned as “rights” analysis, enabling

ESP practitioners and their students to see target communities of practice as not solely defined by those in power, but as places where newcomers have rights too—to be included and accommodated—hence as interactive social systems that can, and should, change as new members join. (Belcher, 2009, p. 7)

This “critical” perspective on needs analysis is not yet the mainstream view, but its influence on LSP is growing; for example, it is now well recognized that student perspectives and even feelings need to be taken into account in the LSP classroom.

Specificity

The level of specificity called for in ESP instruction has been a controversial question that has simmered for a long time. Johns and Dudley-Evans (1991) identified the question of how “specific” the focus of ESP courses should be as an area of controversy 20 years ago, noting this question was first raised more than 10 years before then in the 1970s. Hyland (2002) defines the issue this way:

Put most simply, this resolves into a single question: are there skills and features of language that are transferable across different disciplines and occupations, or should we focus on the texts, skills and language forms needed by particular learners? This question lies at the heart of what our profession is and what we do in our classrooms. (p. 385)

The two sides to this issue are often framed as “narrow-angle” and “wide-angle.” Those favoring the wide-angle perspective—most typically those in language for academic purposes—note that there is a core of language and language learning strategies that is common across broad subject areas, and that students are best served by having exposure to language and language strategies that address wider, though closely related, contexts such as university classes (e.g., see Spack, 1988). Those favoring the narrow-angle perspective see this issue of specificity as the distinguishing trait between LSP, which addresses

clearly articulated language needs in specific contexts, on the one hand, and general language courses, which often focus more on general language structures and vocabulary, on the other hand (Hyland, 2002).

Johns and Dudley-Evans (1991) and more recently Belcher (2006) strike a middle ground on this debate, recognizing the value and realities of both perspectives. Belcher goes so far as to say that for many “the wide versus narrow approach debate is a nonissue” (p. 139), as the teaching approach should really be dictated based on what the learners need. This more flexible perspective on specificity as driven by the instructional context is reflected in several entries in the encyclopedia. The wide-angle perspective can be seen in *READING AND LANGUAGE FOR SPECIFIC PURPOSES*, which argues that there are broad reading skills and strategies that should be addressed when teaching in LSP contexts, while a more narrow-angle perspective can be seen in *ENGLISH FOR NURSING*, which focuses on nursing-specific language needs of nurses, both those in training and practicing. Nevertheless, as Master (2005) notes, ESP is all about specificity—“detailed explications of the nature of the language used or required to communicate in specific academic and occupational settings, usually accompanied by specific pedagogical applications for non-native speakers of English” (p. 102); otherwise, it is not language for *specific* purposes.

The question, however, is how “specific” do the course focus, materials and targeted language instruction need to be for a course to be classified as an LSP course. Is it inappropriate to ever focus on general language concepts or use materials that do not immediately or directly address specific language contexts? It is not universally agreed where the dividing line is—on the continuum that stretches from general language instruction on the one end to the most focused and targeted instruction on the other—that differentiates a course as either “language for general purposes” or “language for specific purposes.”

The “Subject Knowledge Dilemma”

One of the biggest challenges in LSP contexts is that teachers often find themselves having to deal with specialized areas of knowledge in which they have not been trained. Hutchinson and Waters (1987) early on observed that “ESP teachers are all too often reluctant dwellers in a strange and uncharted land,” frequently having to “teach with texts whose content they know little or nothing about” (pp. 158, 160). Simply put, does one have to be an engineer to teach the language of engineering? Wu and Badger (2009) call this the ESP teachers’ “subject knowledge dilemma”; they go on to note that “there is surprisingly little written about what subject-matter knowledge an ESP teacher might be expected to have” (pp. 20–1).

Master (2005) notes that this question of how much subject-matter expertise the LSP teacher must have has been an area of controversy from the early days of LSP. While most in the field of LSP hold to a more middle ground, he describes the tension as being between those who on the one side see it as sufficient for teachers to simply be able to use content from the specific area as a tool to teach language—even if they have no training in the subject area—versus those who see LSP as “an entirely content-based curriculum in which linguistic knowledge is subordinated to subject content instruction” (Master, 2005, p. 107).

Dudley-Evans and St. John (1998) make the distinction between carrier content and real content. The example they give is the use of a text related to the life cycle of a plant (the carrier content) to teach the expressions of time sequence used in the description of processes and cycles (the real content); they note: “It is not the aim of the exercise to teach students about the life cycle . . . It is an authentic topic which can be used as a vehicle for the *real content* of the unit, the language of process” (p. 11). The point they are making is that what the ESP teacher is responsible for is teaching the language that scientists use to describe processes and cycles, not the processes and cycles themselves.

While focusing on language notions (like process and cycle description) used in specific contexts is a proven approach when working with low-level language learners and those who are novices in the content area, it is much more challenging when working with more proficient speakers who have expertise in their field, like medical students. Indeed, as Belcher (2009) observes,

It is not usually a comforting thought, to say the least, for any teachers, novice or experienced, to realize that their students may know more about a crucial subject area (or the “carrier content”) of a language course than they, the teachers, do. (p. 11)

Dudley-Evans and St. John (1998) argue that subject-specific language instruction is most effective when subject-area specialists are involved, and this involvement can take place at three different levels: cooperation, collaboration, and team teaching. Cooperation is simply the teacher using subject-area specialists as informants to determine the sorts of language and language use students have to master in specific contexts. Collaboration goes a step further with the subject-area specialist more directly involved in lesson planning and material selection/development. Team teaching is “the actual working together in the classroom of the subject and language specialists” (p. 45). Which level of interaction between the language and subject-area specialist is used is best determined by the needs of the students in the particular context, although team teaching in reality seldom occurs due to cost and logistical challenges.

Several entries address directly or indirectly the role of the instructor’s subject knowledge in teaching LSP. Entries such as *METHODS FOR LANGUAGE FOR SPECIFIC PURPOSES*, *MATERIALS FOR LANGUAGE FOR SPECIFIC PURPOSES*, and *CONTENT-BASED INSTRUCTION IN ENGLISH FOR SPECIFIC PURPOSES* tackle this issue most directly. All of the entries that overview LSP instruction in specific contexts—such as *ENGLISH FOR MEDICAL PURPOSES* and *LANGUAGE FOR TOURISM*—also touch on the necessity of instructors to understand and use knowledge of the subject area in their instruction.

Along with the three issues highlighted above, assessment is an important concern in LSP instruction, and two entries—*ASSESSMENT OF ACADEMIC LANGUAGE FOR SPECIFIC PURPOSES* and *ASSESSMENT OF BUSINESS AND PROFESSIONAL LANGUAGE FOR SPECIFIC PURPOSES*—highlight important considerations. In addition, two entries overview the impact that technology is having on the teaching of LSP; *TECHNOLOGY AND TEACHING LANGUAGE FOR SPECIFIC PURPOSES* gives a broad overview and *CORPORA IN THE TEACHING OF LANGUAGE FOR SPECIFIC PURPOSES* highlights a common application of technology in instruction. The entry *TEACHER EDUCATION FOR LANGUAGE FOR SPECIFIC PURPOSES* reflects on the challenges of and the best practices for preparing LSP teachers in the myriad of areas reflected in this overview.

Research in LSP

As an area of applied linguistics, LSP has from the beginning been grounded in scholarship and research, and like other areas of LSP, ESP has led the way. In keeping with Johns’s (1991) challenge to constantly develop new techniques for examining language tasks, contexts, structures and learning strategies, the analysis of the structures and uses of language in the specific contexts that learners want and need to interact in continues to grow as a significant part of what LSP practitioners do. Indeed, Belcher (2006) notes that because LSP is driven by understanding student needs, the dividing lines “between researchers and teachers . . . are frequently blurred” (p. 135). Research—ranging from informal needs analyses to qualitative case studies and ethnographies to statistically analyzed empirical studies—is as important to the field of LSP as teaching, with each informing the other.

The current state of LSP research is well documented in the entries that follow and, as noted by Master (2005), this research focuses primarily on “specificity, that is, detailed explications of the nature of the language used or required to communicate in specific academic and occupational settings” (p. 102). The entry LANGUAGE FOR SPECIFIC PURPOSES RESEARCH METHODS provides the context for a set of entries that describe a variety of perspectives (including intercultural rhetoric and critical EAP pedagogy) and methodologies (e.g., CORPORA IN LANGUAGE FOR SPECIFIC PURPOSES RESEARCH—including LANGUAGE FOR SPECIFIC PURPOSES LEARNER CORPORA, and GENRE AND DISCOURSE ANALYSIS IN LANGUAGE FOR SPECIFIC PURPOSES) that are commonly used in LSP research, as well as highlights closely studied areas of discourse (RESEARCH ARTICLES IN ENGLISH FOR SPECIFIC PURPOSES, and THESES AND DISSERTATIONS IN ENGLISH FOR SPECIFIC PURPOSES). Entries on READING AND LANGUAGE FOR SPECIFIC PURPOSES, WRITING AND LANGUAGE FOR SPECIFIC PURPOSES, and VOCABULARY AND LANGUAGE FOR SPECIFIC PURPOSES, as well as those looking at specific purposes (e.g., ENGLISH FOR SCIENCE AND TECHNOLOGY) also show how research on specific uses of language in specific contexts are applied in the classroom.

Looking to the future as LSP instruction becomes more diverse as well as specialized, the field of LSP must continue developing research perspectives and methods that provide not only a broader but also a more detailed understanding of learner needs within a changing world context. In particular, there needs to be more concern with issues of power and accommodation between native and non-native speakers in contexts where languages are used as a lingua franca—for example, in the case of English as the lingua franca in many professional contexts (e.g., international scholarly publication) and areas of commerce (e.g., aviation and maritime communication). Instead of relying on the analysis of language and texts out of context, researchers need tools to study the complex contextual, social, and ideological aspects of language interactions. These interactions are often multimodal, including text and talk as well as other forms of content and message delivery. Research methods relying only on the study of words and discourses are no longer sufficient. Methods such as observations and ethnographic approaches are also needed, along with detailed analyses of interactions, not only to better understand the complexities of language use but also the pragmatic strategies that are necessary for effective communication in specific contexts and for specific purposes.

Final Thoughts

Both research and practice in language for specific purposes have benefited from the work of variety of leading thinkers from around the world. The following distinguished scholars were chosen to be featured in biographical entries from a much larger set of distinguished members of the profession: Charles BAZERMAN, Diane BELCHER, Vijay BHATIA, Dan DOUGLAS, Tony DUDLEY-EVANS, Liz HAMP-LYONS, Ken HYLAND, Ann JOHNS, Brian PALTRIDGE, Larry SELINKER, John M. SWALES, and Louis TRIMBLE. Their biographies map out the development of LSP as an important area of inquiry in applied linguistics over the past fifty years. New ideas and issues in LSP are often first addressed in the three leading journals in the field: *English for Specific Purposes: An International Research Journal*, *Ibérica* (journal of AELFA, the European Association of Languages for Specific Purposes), and *Journal of English for Academic Purposes*.

The study of LSP is an extremely important area of applied linguistics because of its promise for improving opportunities and promoting expertise in a wide variety of academic and occupational areas around the world. In our globally interconnected world, fewer and fewer areas can be found where no need exists for specific language instruction to facilitate the learning and work of non-native speakers of the target language. From university

campuses to community literacy and citizenship programs, from skilled occupations like aviation to prison education programs, from doctor–patient interactions in inner-city hospitals to health programs in the poorest parts of the world—all of these areas and more require “language to accomplish purposes and engage with others as members of social groups” (Hyland, 2002, p. 391). It is the mission of LSP to understand what these language needs are—including the distinctive features of the language—for the specific contexts in which the language will be used, and then choose or develop the materials and methods that will best facilitate learning. The LSP entries in the encyclopedia not only describe in more detail the field of LSP, but also showcase the innovative and groundbreaking work that is being done by some of the best teachers and scholars in applied linguistics.

Language for Specific Purposes Research Methods

CHRISTINE M. TARDY

The study of language for specific purposes (LSP) uses a range of research methods, including qualitative and quantitative analysis of texts, contexts, and practices. Research in LSP generally shares the goal of informing LSP teaching. From its early days, LSP research has analyzed target situations, aiming to understand the participants' practices, interactions, and values. One of the most common purposes for LSP research is to analyze the target language in areas such as linguistic form, rhetorical structures, purpose, or even reader response. Some research also examines learners, at times comparing their skills and language use with that of the target language or context. While early research took the form of relatively simple descriptions aiming for direct applications to teaching, contemporary research is characterized by richer investigations into the relationships between texts and contexts. Research has also moved from the study of isolated texts to the study of textual and contextual networks, recognizing the role of participant relationships and issues of power. Although LSP research utilizes several primary methods, researchers often integrate these methods within single studies.

Needs Analysis

As an approach to language teaching, LSP has often been described as needs-driven. That is, the needs of students within the target context, using the target language, are a starting point for course design. Needs analysis research has thus been prominent within LSP. Needs analysis is not a method so much as it is a set of methods used to analyze learner needs, frequently aiming to identify characteristics of the specialized language context that learners will need to build proficiency in. Many of the research methods described below are used to analyze specialized language or contexts. In addition, needs analysis may use interviews or surveys to identify learner needs from the perspectives of experts or learners themselves. In academic settings, needs analysis frequently analyzes target classroom assignments, through content analysis or surveys, to identify the types of tasks that learners will need to perform. Observations of target contexts—whether they be classrooms or workplaces—are also commonly used to identify valued practices and language use within the specialized setting.

Text and Register Analysis

Early LSP research most often took the form of text feature analysis or *register analysis*. In this method, researchers analyze target language in terms of the use of a single or small number of textual features, such as sentence length, passive voice, or personal pronouns. Although some early work of this type used corpora consisting of a single text type, such as research articles, more often the corpora consisted of multiple text types within a single register (that is, a variety of language distinguished according to use, such as scientific

writing or engineering writing). In early register analysis, the researcher counted occurrences of target features in order to understand the relative usage of such features within a type of text. Because such counts were completed without the aid of computer technology, corpora were relatively small, typically ranging from just a handful of texts to around 30. Such analysis generally focused on written, rather than spoken, language; the goal was to identify patterns of usage that could then be taught to LSP learners.

Corpus-Based Text Analysis

As technology has evolved, researchers have increasingly made use of computerized corpora (systematic collections of digitized searchable texts) and concordancing software. These tools allow the analyst to easily tag the corpus in terms of parts of speech to identify the frequency and function of different occurrences across registers or text types. *Multidimensional analysis* (Biber, 1988) can be used to examine how such features co-occur in sets across registers. These sets of co-occurrence reflect shared functions, or dimensions, which can then be analyzed within and across registers. Concordancing software is also used to identify lexical occurrences and collocations, including “lexical bundles” or common word clusters. Items like hedges (*could, might*), boosters (*will, must*), and metatext (*in contrast, this shows*) can be identified and counted relatively easily, giving more detailed descriptions of the target language. Work by Hyland (2000, 2005), for example, has analyzed such features specifically in academic writing, most often comparing use across disciplinary texts. Other studies have compared particular features, such as lexical bundles, across spoken and written academic registers (e.g., Biber, Conrad, & Cortes, 2004; Biber & Barbieri, 2007).

Today’s computerized corpora can basically be divided into two types: general and specialized. General corpora compile a vast number of texts, often categorized by registers like conversation, news, academic writing, or academic speaking. The goal of general corpus analysis is to identify language features that are broadly characteristic of a given register in order to draw generalizations; such insights can inform textbook production and classroom teaching. Although some corpus analysis aims to describe one particular register or text type, this research method can also examine multiple registers for purposes of comparison. Such large-scale studies offer powerful insight into language use, though some have argued that their breadth makes them less useful for the specialized contexts of LSP. Narrow-angle or specialized corpora have developed as alternatives, investigating a more focused body of language, such as research articles published in a specific journal or on a specific topic. Specialized corpora are advantageous because they can feasibly be compiled by students or teachers for direct analysis (Flowerdew, 2004). Corpus analysis can also be used to compare learner and expert language, native and non-native language users, disciplinary texts, languages, or even a single genre or register over time.

Discourse Analysis

While corpus analysis provides strong textual descriptions of LSP, it is difficult to examine broader stretches of text and whole textual units—that is, discourse—and their structural patterns through current corpus methods. *Discourse analysis* has taken on great importance as a research method within LSP as a way to examine texts as entire units of discourse; the focus here is on the structures and patterns that create meaning for the text as whole. Discourse analysis can take a textual or social orientation, or it can integrate the two. One framework for understanding the social or contextual features that influence texts comes from systemic functional linguistics. Halliday’s (1978) theory of functional grammar

describes three important contextual variables: *field* (the topic), *tenor* (the participants and their roles), and *mode* (the channel of communication). Contextual features—outlined through this framework or others—are critical in analyzing the reasons for occurrences of particular discursive features such as logic or argumentation, organization, cohesion, turn taking, or politeness strategies. Discourse analysis in LSP has studied both written texts (such as business correspondences or academic papers) and spoken texts (such as professional negotiations or classroom lectures).

Discourse analysis studies of oral language for specific purposes have investigated such contexts as academic lectures, classroom discussions, and medical communication. They have commonly used corpus-based text analysis, conversation analysis (including turn taking, sequencing, initiating discussion, or signaling topic), or move analysis (discussed below). Studies of written discourse have commonly examined discursive features such as coherence, cohesion, theme–rheme or given–new structures, logic or argumentation, or rhetorical devices.

Although discourse analysis has traditionally focused on verbal language—written or oral—it has also taken into account the growing presence of the visual modes of communication used within many academic and professional texts. One common approach to *multimodal discourse analysis* examines the functions taken on by different modes: ideational (to convey meaning about states of affairs), interpersonal (to convey meaning about attitudes and relations among writers and readers), and textual (to convey meaning about the text and its structure) (Halliday, 1994). Such analysis may further investigate how different modes (e.g., visual, written, oral) may be more or less effective at carrying out different functions. LSP multimodal discourse analysis has examined scientific articles, popular scientific texts, and professional conference presentation slides.

Genre Analysis

One form of discourse analysis that is especially prominent within LSP research is known as *move analysis*, sometimes also equated with the broader term of *genre analysis*. In the early 1980s, LSP researchers began to take into account the rhetorical functions of text features, leading to increased attention to the users and communicative purposes. As such, research began to focus on more specific text types and their functions, using the term *genre* to capture the rhetorical dimension of texts (Swales, 1981). Broadly speaking, genre refers to a socially situated use of language intended to carry out a particular action. Swales (1990) developed a method of analyzing how a text carries out its rhetorical functions through patterns of distinct stages, referred to as rhetorical moves. This method has become a common research method in LSP. A similar approach to investigating the structural elements of text-genres identifies genre stages, defined as functional sequences within generic structures (Martin, 1993).

Researchers using move analysis typically identify a target genre, compile a representative corpus, and identify patterns of rhetorical structures. The analyst identifies the most common moves (i.e., parts of the text that carry out distinct rhetorical functions) and sometimes the various “steps” (or submoves) that are possible within each move. Because move analysis is mostly carried out without computers, the corpora are usually fairly modest in size. Move analysis has contributed significantly to the understanding of common academic and professional genres, and it provides a methodology for investigating how users carry out rhetorical functions within a given context. One of the most common genres analyzed through move analysis is the academic research article, with numerous studies comparing differences across disciplines, languages, national culture, and gender. Move analysis has also been applied to investigate a wide range of other professional and academic genres, such as letters of application, legal reports, grant proposals, and theses (Biber, Connor, &

Upton, 2007). LSP pedagogy has made use of move analysis in the classroom, teaching students to analyze moves in target genres, essentially becoming researchers of the writing they are learning.

Although early genre analysis tended to focus on the move structure of single genres, it has expanded to include the analysis of networks of genres, known variously as *genre sets*, *genre systems*, and *genre chains*. Intertextual genre analysis identifies the genres that are used within a community of users to carry out certain tasks. This kind of analysis may further examine how certain spoken and written genres are related, who writes or reads in which genres, and how genres respond to other genres in the system.

Activity Systems Analysis

Analysis of genre sets or systems has frequently adopted the framework of neo-Vygotskian activity theory, which posits activity as the basic unit of analysis. Activity systems are defined by Russell (1997) as “any ongoing object-directed, historically conditioned, dialectically structured, tool-mediated human interaction” (p. 510). Within any activity system—such as a discipline or classroom—individuals and groups use “tools” (including technology, language, and genres) to accomplish shared motives. Examining contexts of LSP through an activity systems perspective can highlight for researchers the complex relationships between individuals, community goals, tasks, and the tools that are used to carry them out. Activity systems research has analyzed university classrooms, seminars, and tasks within LSP settings. This method shifts attention from the text (evident in the research methods reviewed thus far) to the contexts and the social practices that surround and influence language. This attention to social context has become increasingly common in LSP research. As such, new methods in LSP often draw on methodology from the social and behavioral sciences, in many cases blending and adapting these methods to the study of language.

Case Study

Case study research is often used to carry out naturalistic inquiry into what people do in a particular setting. Case studies can focus on experts, aiming to describe insider knowledge and practices, or on learners, aiming to understand how learning occurs in specific settings, over time, or both. Notable case studies in LSP have examined writing and publication processes, academic mentoring, and individuals writing within and across courses or professional tasks. In LSP, case studies commonly make use of interviews, observations, diaries or journals, and collection and analysis of written texts. While case studies lack the powerful generalizations one can draw from, for example, a large-scale corpus analysis, they provide in-depth insights into the intricacies and complexities of the use or learning of specialized language in context, or both. Case studies have been carried out extensively within academic settings, following the practices and development of undergraduate and graduate students as well as academics writing for publication.

Ethnography and Textography

As early as the late 1980s, *ethnography* was used in LSP to identify needs within a target situation. Adapted from anthropology as well as from sociolinguistic ethnography of communication, LSP ethnographic research analyzes a social community from an emic (insider) perspective. Using observation and interviews, sometimes supplemented by analysis of written texts, the researcher aims to build a “thick description” of the target community,

its practices, and its values. Bringing together multiple sources of data, ethnographers identify interpretive categories that eventually lead to new insights into the community or context. Ethnographic studies have examined workplaces, classrooms, and academic institutions, and they have investigated activities like academic discussions, mentoring, and business negotiations. Although such research was initially intended to inform course design, more recent ethnographies also trace learner development. Some LSP researchers have taken a more text-based approach to ethnography through a methodology known as *textography* (Swales, 1998). Tracing individuals' textual histories and practices within physical and professional communities over time, textography employs interviews, various methods of text analysis, and observation; the goal is to locate relationships between particular and communal dimensions of text and textual practices and between present and prior texts.

Intercultural Rhetoric

The study of what is now termed *intercultural rhetoric* (IR) has grown out of *contrastive rhetoric*, the study of the linguistic and cultural differences in texts. Contrastive rhetoric was first described in Kaplan's (1966) study of paragraph organizational patterns across English-language academic texts written by second language writers. Though this pioneering work has been faulted for its overgeneralizations and privileging of English-language rhetorical styles, research has continued to explore the ways in which cultural communities adopt different rhetorical preferences in written texts. In the 1980s and 1990s, contrastive rhetoric studies often analyzed differences in rhetorical structures or textual features in a single genre carried out in two or more languages. In the early part of the 21st century, IR research has also considered the social contexts within which texts are produced and received—an especially important factor when comparing texts according to their cultural and linguistic properties. With this widening perspective, IR analysis has utilized genre analysis and corpus-based text analysis as well as ethnography, valuing the layers of insight that can be gained from mixing these methods. While IR research has focused most extensively on academic genres, there has been a growing interest in professional genres within this research area.

Interviews

Interviews have become an important technique for supplementing data collected through many of the above methods. In text- and discourse-based analysis, experienced users of the target language are often interviewed to provide insider perspectives. These interviews may take the form of focus groups, structured interviews, unstructured interviews, or discourse-based interviews, in which interviewees discuss particular texts and their choices or preferences as a reader or writer. Interviews are a flexible method in that they can be used to shed light on both language use and LSP contexts of use; in the latter case, members of the target community may be asked to describe common practices or identify privileged forms of communication (e.g., Hyland, 2000). Interviews are also useful in research on LSP learners, providing insight into learners' declarative knowledge, reactions to tasks or instructional approaches, and writing processes (e.g., Tardy, 2009).

Mixed-Method Research

Although primary research methods in LSP have been described separately here, in practice they are very often integrated. For instance, studies of text may blend analysis

of linguistic features, genre moves, and discourse analysis, bringing in interviews and observations for further insight. Studies of learners or target situations similarly draw on a range of research methods to bring together different perspectives (e.g., Angelova & Riazantseva, 1999). Quantitative, qualitative, and textual analysis have all become valued research approaches within LSP; together, they help researchers and practitioners build more detailed descriptions and analyses of target settings, target language, expert practices, and learning processes.

Critical Approaches to LSP Research

LSP research has typically tended toward a descriptive research, leading some to criticize an emphasis on a pragmatism that fails to take into account the role of power in specialized language use. Such a perspective acknowledges the social dynamics that students and others face when using language in specific settings and strives to foreground these dynamics and their implications. A range of critical methods have been adopted in more recent research of LSP.

One of the earliest examples of this orientation within LSP is Benesch's (2001) work on *critical needs analysis*, or rights analysis. Critical needs analysis aims to go beyond the traditional identification of student needs by examining how power is maintained and resisted within the target context. The goal of critical needs analysis is to transform the situation, asking students to participate in discovering and enacting possibilities for change.

A second approach, *critical discourse analysis*, examines how texts themselves reflect and perpetuate social relations and ideologies through analysis of text and context. Corpora in CDA research vary largely, ranging from a single text to a constellation of texts focused on a single topic or event. Texts may be analyzed in terms of ideological discourse structures (van Dijk, 1998), which include, for example, topics, genre or schemas, style, interaction strategies, and rhetorical devices such as metaphors. Within LSP research, CDA has primarily been used to research professional and bureaucratic genres.

The critical study of academic language use has more often been taken up through *critical ethnography*, which aims to understand the complexities and inherent inequities in the contexts in which language is produced, reproduced, and learned. Though this method strives toward the level of description characteristic of traditional ethnography, critical ethnography takes an overtly critical/political stance toward the practices and texts that it analyzes. Within LSP, critical ethnography commonly examines issues of language access, linguistic capital, and the consequences of such dimensions of power (Starfield, 2011).

Martin-Jones, Marilyn

KATHRYN JONES

Marilyn Martin-Jones is an emeritus professor based at the MOSAIC Centre for Research on Multilingualism in Birmingham, England. Over more than three decades, she has been involved in research in multilingual contexts in England and Wales. She is herself multilingual and speaks, reads, and writes Welsh, English, French, and Portuguese. Marilyn Martin-Jones has a particular interest in the ways in which language and literacy practices contribute to the construction of identities in multilingual settings, in local-life worlds, and in institutional contexts, and in the ways in which such practices are bound up with local and global relations of power. These themes have been reflected in her research and publications since the 1980s.

Marilyn Martin-Jones was born in 1944 in Bangor, North Wales, and was educated in the United Kingdom and the USA. On completing her PhD in linguistics at Stanford University, California, she returned to Britain and was appointed to a research post with the Linguistic Minorities Project (1979 to 1983) at the Institute of Education, University of London. By 1983, she had moved to Lancaster University, where she became a member of the newly formed Centre for Language in Social Life. In this center, Marilyn Martin-Jones found herself among colleagues with a strong interest in discourse and in critical approaches to research on language and literacy. Her own commitment to critical discourse analytic approaches to multilingualism was confirmed. A chapter, in a volume entitled *Anthropology and the Politics of Language* (Martin-Jones, 1989), was her first contribution to this new line of thinking within research on multilingualism.

In 1989, she also began a three-year research project (with Mukul Saxena) entitled Bilingual Resources in Primary Classroom Interaction (ESRC grant no: X204252001). The focus was on a new form of primary-education provision for children from linguistic minority backgrounds: that of appointing bilingual classroom assistants to work alongside monolingual class teachers. The aim was to identify the ways in which this educational policy was being translated into practice, within the daily routines of primary classroom life. The participating schools were in the North West of England and the focus was on teaching/learning events where Panjabi, Urdu, and English were used. This project led to several widely cited publications (Martin-Jones & Saxena, 1995, 1996, 2003). Through close and insightful analysis of the bilingual discourse in different kinds of classroom activities, Marilyn Martin-Jones and Mukul Saxena showed how and in what conditions bilingual practitioners were able to create bilingual learning environments for learning, drawing in subtle and nuanced ways on the resources within their communicative repertoire.

In the late 1980s, Marilyn Martin-Jones founded the Lancaster Bilingualism Research Group which brought together a number of doctoral research students who were conducting research in different multilingual settings in Africa, Europe, and South America. At the time, the landscape of language policy research was dominated by macro level studies of language planning and policy. However, the members of the Bilingualism Research Group were primarily interested in the situated nature of language policy implementation processes and were convinced that ethnography and close analysis of bilingual discourse were best suited to research in this area. Gradually, contact was made with other researchers who were working in the same vein, notably Monica Heller (e.g., Heller, 1994) and Nancy

Hornberger (e.g., Hornberger, 1988). These contacts eventually led to long-lasting research collaborations and to inclusive publications which enabled new and established researchers on either side of the Atlantic to contribute (e.g., Martin-Jones & Heller, 1996; Martin-Jones, 1997, 2007; Heller & Martin-Jones, 2001; Martin-Jones, de Mejía, & Hornberger 2008).

Perhaps Marilyn Martin-Jones is best known for her research on multilingual literacy. She was one of the first researchers in Britain to develop empirical research at the interface between critical approaches to research on multilingualism and the ethnography of literacy. This research was first developed (with Arvind Bhatt) through two consecutive research projects (1993–6), with Gujarati speakers in the city of Leicester, England: *Multilingual Literacy Practices: Home, Community and School* (ESRC grant no: R000233833) and *Literacies at Work in a Multilingual City* (ESRC grant no: R000221534). This collaboration with Arvind Bhatt was a fruitful one and gave rise to a number of publications (e.g., Martin-Jones & Bhatt, 1996; Martin-Jones, 2000). In 1996, Marilyn Martin-Jones organized a research seminar at Lancaster on multilingual literacies which brought together researchers across Britain who were working in this field. This collaboration culminated in a co-edited volume entitled *Multilingual Literacies: Reading and Writing Different Worlds* (Martin-Jones & Jones, 2000).

In 1998, Marilyn Martin-Jones took up a chair in bilingualism and education at Aberystwyth University where she turned her attention to bilingualism in Wales. There, she began her third ethnographic research project on literacy, this time in North Wales, entitled *Bilingual Literacies for Learning in Further Education* (ESRC grant no: RES-139250171). The project focused on the bilingual literacy practices of young Welsh speakers in rural Wales, aged 16–19, in different domains of their lives: at home, at work, and at college, including both print and screen literacies. (For details, see Martin-Jones, 2009, 2011; Martin-Jones, Hughes, & Williams, 2009.)

From 2005–10, Marilyn Martin-Jones was professor of languages in education at the University of Birmingham and she was the first director of the MOSAIC Centre for Research on Multilingualism. Two decades of experience of undertaking ethnographic research in multilingual settings in England and Wales laid the foundations for her current project, with Deirdre Martin and colleagues at the MOSAIC Centre. This is a capacity-building project for new researchers entitled *Researching Multilingualism, Multilingualism in Research Practice* (2010–13) (ESRC grant no: RES-046-25-004). The aim of this project is to build an international network of researchers who are pursuing fresh lines of inquiry in research on multilingualism, with a view to forging a new sociolinguistics which is attuned to the description and analysis of the profound cultural and societal changes taking place in the late modern era.

Models of Lexical and Conceptual Representations in Second Language Acquisition

JANET G. VAN HELL AND GREGORY J. POARCH

Words are the basic building blocks of a language. A simple combination of the letters *d*, *o*, and *g* opens up a world of meaningful images and experiences with this four-legged hairy pet. Over the years, children who learn a language accrue fine-grained knowledge on the various meaning aspects related to a word form like *dog*, and learn that not only grandma's black doggie is a dog but also the white barking creature living next door. How does a learner of a second language (L2), who has already established basic relationships between a word form in the first language (L1) and its meaning, acquire the form and meaning of words in the L2? This is one of the key questions in research on L2 learning, and a question that attracts an increasing amount of attention from researchers interested in the cognitive and neural mechanisms of L2 learning. In this entry, we will review theoretical models on lexical (form) and conceptual/semantic (meaning) representation in L2 learners, and outline empirical studies on how L2 learners at different levels of proficiency access L2 word meanings and fine-tune conceptual representations of L2 words. In this entry, we make no distinction between semantic and conceptual levels (cf. Francis, 2005). We focus on late learners who learned their L2 after the basics of the L1 have already been acquired.

Theoretical Models

Psycholinguistic models on the bilingual mental lexicon typically discern between lexical representations in L1, lexical representations in L2, and conceptual-semantic representations that are shared between the two languages. The term "bilingual" refers to L2 users, regardless of their level of L2 proficiency. Two classes of models have been proposed to describe the lexical and conceptual representation and processing of words in the bilingual mental lexicon. One class of models focuses on the mappings between word forms and their meanings, and how such mappings may change in the course of L2 acquisition. The other class of models describes the activation of lexical information in fluent bilinguals (for a review, see Thomas & Van Heuven, 2005). Given this entry's emphasis on L2 learning and the consequences for lexical and conceptual representations and processing, we will focus on the first class of models.

In one of the first empirical papers on lexical and conceptual representations in L2 learners, Potter, So, Von Eckardt, and Feldman (1984) proposed and tested two models: the word association model and the concept mediation model. Both models distinguish between a lexical level (representing word forms in a separate lexical store for L1 and for L2) and a conceptual level (representing word meanings in one common store). The two models also assume a direct link between the L1 lexical store and the conceptual system. The models differ in their assumptions on the mapping between L2 word forms and their meaning. The concept mediation model postulates a direct link between L2 word forms and the

conceptual system. According to the word association model, L2 learners access the meaning of L2 words indirectly via the lexical link to the L1 word form, and then follow the link from the L1 word form to the conceptual system. Evidence from early studies that tested these two models in the 1980s and early 1990s indicated that the two models describe bilinguals at different stages of L2 proficiency. Performance of proficient L2 users appeared more congruent with the concept mediation model, whereas performance of beginning L2 learners was more congruent with the word association model.

This developmental shift formed the basis of the revised hierarchical model (RHM), proposed by Kroll and Stewart (1994; for an update, see Kroll, Van Hell, Tokowicz, & Green, 2010). Integrating the word association and concept mediation routes, the RHM states that the strength of the links between the word form representations and the conceptual system differs as a function of L2 proficiency, and the relative dominance of L1 to L2. Specifically, for bilinguals who are more proficient in L1 than in L2, lexical-level word-to-word connections from L2 to L1 are stronger than those from L1 to L2. Word-to-concept connections are stronger for L1 than for L2. According to the model, L2 learners will initially rely on their established L1 word knowledge when they are processing words in their weaker L2. To access L2 word meaning, beginning L2 learners map the L2 word form onto the L1 word form and then retrieve the meaning (i.e., following the word association route). As L2 learners become more proficient in L2, L2 word meanings will gradually be accessed through a direct “concept mediation” route, from L2 word forms to concepts (see Kroll et al., 2010, for a current review of empirical evidence and the RHM).

All models discussed above assume that the meaning of an L2 word and its translation is shared, and that words in each of the bilingual’s languages access the same conceptual representation. A study by Van Hell and De Groot (1998), however, questioned the assumption of a shared conceptual representation. They asked Dutch–English bilinguals to perform a word association task twice on the same list of words on different occasions, once in the language of the stimuli (within-language) and once in the other language (between-language). They manipulated the grammatical class (nouns vs. verbs), concreteness (concrete vs. abstract), and cognate status of words (cognates, i.e., translations that share their orthography and phonology, vs. non-cognates). It appeared that the within- and between-language associations for concrete words and for cognates were more often translations of one another than those for abstract words and non-cognates, and nouns evoked more translations than verbs. This suggests that lexical and conceptual representations may be more similar for some types of words (e.g., concrete cognate nouns like ‘apple-*appel*’) than for others (e.g., abstract non-cognate nouns like ‘truth-*waarheid*’).

The notion that conceptual representation can be graded is a basic assumption in the distributed feature model developed by De Groot, Van Hell, and colleagues (e.g., De Groot, 1992; see Van Hell & De Groot, 1998, for a model assuming distributed lexical and conceptual representations). This model proposes that lexical and conceptual representations are not necessarily the same across languages, but can vary in terms of the number of lexical and semantic features shared between languages. This assumption ties in with the notion that words are “slippery customers” (Labov, 1973, p. 341), and that word meanings are fuzzy and can vary with the context of use. The distributed feature model’s assumption that an L1 word and its L2 translation may access different conceptual representations is also reflected in Finkbeiner, Forster, Nicol, and Nakamura’s (2004) proposal that L2 words are associated with fewer semantic senses than L1 words.

Accessing the Meaning of Second Language Words

One of the basic questions in research on lexical and conceptual representations in L2 learning is how bilinguals access the meaning of L2 words. The RHM states that during

the early stages of L2 learning, L2 learners will rely more on word form than on meaning as the L2 form-to-concept mappings are still relatively weak. In later stages of L2 learning, L2 learners will rely more on meaning than on word form. The translation recognition task is often used to examine how bilinguals access the meaning of L2 words. Talamas, Kroll, and Dufour (1999) presented two words to less- and more-proficient bilinguals, who then had to indicate whether the two words were translations or not. The critical stimuli were incorrect translation pairs of which the second word was either related in lexical form to the correct translation (e.g., MAN–HAMBRE ‘hunger’, instead of MAN–HOMBRE ‘man’) or in meaning (e.g., MAN–MUJER ‘woman’). The less fluent bilinguals suffered more from word form interference than from semantic interference. The more fluent bilinguals, however, suffered more from semantic interference than from word form interference. The findings support the idea of a developmental shift from form to meaning as L2 learners become more proficient, in accordance with the predictions of the RHM. This pattern of findings was also observed in late non-proficient and proficient Catalan–Spanish speakers (Ferré, Sánchez-Casas, & Guasch, 2006).

Sunderman and Kroll (2006) also found that word form interference effects disappeared when learners became more proficient in the L2, although in this study the less proficient L2 learners showed both form and meaning interference. Beginning learners showing meaning interference have also been observed in other studies (Altarriba & Mathis, 1997; Comesaña, Perea, Piñeiro, & Fraga, 2008; Brenders, Van Hell, & Dijkstra, 2011). For example, Brenders et al. (2011) tested Dutch fifth-grade and sixth-grade children who had received one-hour English-language classes at school for about 5 and 16 months, respectively, and proficient adult Dutch-English bilinguals. The behavioral data as well as measures of brain activity (i.e., Event-Related brain Potentials) revealed that both groups of beginning learners showed substantial meaning interference and form interference effects, as did the proficient adult bilinguals. The child L2 learners examined by Brenders et al. learned L2 English in a meaningful and contextually-rich environment, which may have boosted L2 word form-to-concept mappings.

A recent study by Comesaña et al. (2008) corroborates the suggestion that the conditions in which L2 words are learned affect the strength of L2 word form-to-concept mappings. They tested children using the translation recognition task, and presented semantically related or unrelated word pairs as the critical incorrect translation pairs. The children had learned L2 words via either L2–picture association learning or L2–L1 word association learning. In L2–picture association learning, but not in L2–L1 word association learning, a significant semantic interference effect was observed, after just one vocabulary learning session. The observation of semantic effects in an early stage of L2 learning appears to be related to the conditions under which the L2 had been learned, and the use of pictures might have stimulated the development of L2 word-to-concept mappings. A recent neuro-cognitive L2 learning study showed that L2 word retrieval engaged different cortical structures depending on how these L2 words had been learned (via written L1 translations or in a context-rich real-life situation; Jeong et al., 2010). Variations in learning strategy may thus have a profound influence on the neural underpinnings of lexical and conceptual knowledge in L2 learners.

Freeing and Fine-Tuning the Meaning of Second Language Words

How do L2 learners establish and fine-tune conceptual representations of L2 words? It has been proposed that in the early stage of learning L2 word meanings, L2 learners simply map all semantic features associated with the L1 word form onto the novel L2 word form (e.g., Jiang, 2000). This strategy may be particularly likely when learning the meaning of

L2 cognates (e.g., the Dutch word *kat*) that share their word form with the L1 equivalent (here, 'cat'; e.g., Van Hell & De Groot, 1998). As L2 learners become more experienced in using the L2, and have been exposed to the L2 word in different linguistic and nonlinguistic contexts, they may gradually fine-tune the semantic features associated with the L2 word, by getting rid of the unique L1 meaning parts and by extending the conceptual representation to unique L2 meaning parts (De Groot & Van Hell, 2005). One of the challenges learners face is that words in one language often have more than one translation. Such translation ambiguity impedes learning, more so for words with multiple translations that correspond to the same meaning than for words with multiple translations that correspond to multiple meanings (Degani & Tokowicz, 2010).

Conclusion

To conclude, how late learners of an L2 integrate novel L2 word forms and meanings into an already existing language system is an intriguing question, which also provides a unique window onto the dynamic nature of cognitive development more generally. Lexical and conceptual knowledge of L2 learners is in a continuous flux. One important future question is to capture the time course of L2 lexical and conceptual learning, by studying the timing and degree of neural activation as lexical and conceptual processing unfolds in real time (e.g., Palmer, Van Hooff, & Havelka, 2010), and by examining lexical and conceptual development over an extended period of time using longitudinal designs (e.g., Osterhout et al., 1996).

MacArthur–Bates Communicative Development Inventories

DONNA JACKSON-MALDONADO

Background

There are multiple means for obtaining information about how children develop language. They can be observed in natural play situations, elicitation techniques may be employed, or parents can report on what they observe in everyday activities. Parental report is a cost-effective means for obtaining quick and efficient information about children's communicative abilities because parents know things about their children's language that can only be observed in the day-to-day activities in the home. As early as Charles Darwin, and later in the 20th century, parents have created diaries of their children's language. Elizabeth Bates and colleagues created a more systematic means of parental report (Bates, Bretherton, & Snyder, 1988) in which parents fill out a questionnaire by recognizing rather than recalling the words and sentences their children use. These forms were developed into what is now the MacArthur–Bates Communicative Development Inventories (MBCDIs or CDIs) in English (Fenson et al., 1993; 2007) and Italian (Caselli & Casadio, 1995) with a grant from the John D. & Catherine T. MacArthur Foundation to Bates. Although this parental report is not unique (see also Rescorla, 1989), it has been extensively used to study typical language development and language disorders. This type of instrument is useful for the field of applied linguistics because it allows a special window into the child's communicative ability at a specific time and the data can be compared crosslinguistically. There are currently MBCDIs in over 60 languages with similar formats, developed with language-specific items (for example, in Spanish; Jackson-Maldonado et al., 2003; and for other languages see the MBCDI Web site, www.sci.edu/cdi).

The MBCDIs

The MBCDIs consist of a list of words, gestures, and sentences that are derived from child language samples from each language for which they were developed. The goal of the MBCDIs is to obtain reliable information about children's early comprehension and production of words and phrases, gesture use, and early grammar.

The MBCDIs do not rely on memory as parents are asked to observe only current and salient behaviors. A recognition rather than recall format is used by means of a checklist that contains a large selection of words across several categories. Early grammar is observed for sentence complexity, different morphosyntactic structures (that are language-specific), and utterance length.

Norming studies are developed from ample samples in which the number of words and grammatical structures are calculated in means and percentiles, and normal variability is illustrated. When parents fill out the forms the scores obtained are then compared to the normalized data to determine their level of communicative ability. Thus, at 18 months in word production a child may fall at the 50th percentile (86 words), 75th percentile (209

2 MACARTHUR–BATES COMMUNICATIVE DEVELOPMENT INVENTORIES

words), or lower limit, the 15th percentile (24 words) and be within normal developmental limits. Tables for all levels are provided in the technical manuals or publications.

As with any assessment instrument, the MBCDI is not intended to be used alone and should accompany a larger assessment battery.

The full MBCDI is available in two formats.

1. *First Words and Gestures*, for children between 8 and 18 months, includes
 - a. comprehension of early phrases commonly heard by infants,
 - b. word comprehension and production (approximately 460 words) distributed across different semantic categories, and
 - c. gesture use.
2. *Words and Sentences*, for children between 15 and 30 months, includes:
 - a. word production (approximately 680 words);
 - b. several sections of early grammar are different for each language, and may include specific morphological and/or syntactic forms (such as regular/irregular inflections or case markings) and sentence complexity. Mean length of utterance is also studied. Parents are also asked to write down the three longest utterances their child produces.

Shorter versions of the MBCDIs have also been developed in many languages. They cover the same age ranges as the full forms and usually consist of about 100 words derived from the long forms.

There is also a form, the MBCDI-III or CDI-III, that is used with older children, between 2;6 and 3;11, also with same recognition format. This form includes 100 words that are age-appropriate, and sections on language use, concept knowledge, and complex language structures.

Scoring

For the English and Mexican Spanish versions, precise scores can be obtained by using the MBCDI scoring program that is available on the Web site. By using this program, reports can be generated along with letters for parents and professionals that detail the child's communicative level.

For other languages, tables, graphs, or both with means and percentiles are given and scores may be calculated by hand by finding the total number of words or structures and in a percentile level.

Uses

Of great interest for applied linguists is that crosslinguistic studies have shown similar developmental trends. Consistent findings have been exposed: Development is variable as children acquire words at different rates (see above). It has also been shown that word comprehension always begins months earlier and exceeds production. Theoretical findings have shown that early word production and comprehension have similar underlying relations to gesture use at the early stages of development. Relations are also found between incipient grammar and early vocabulary.

Another important impact of the MBCDI is that it can be used to identify or analyze the communicative abilities of children with language delays and disorders in both the clinical settings and research projects across the world. Studies have been carried out with children with Down syndrome, Williams syndrome, autism spectrum disorder, focal lesion, specific language impairment (SLI), late onset of language, cochlear implants, Fragile X, and other disorders (for instance, Yoder, Warren, & Biggar, 1997; Mervis & Robinson, 2000; Thal,

2000; Luyster, Qiu, Lopez, & Lord, 2007; among others).

The forms have also been used as a basis in research designs to define children by language level as well as age; to predict current language behavior, long-term outcomes in longitudinal designs, short-term effects of training, relations to brain activity; and as risk factor indicators and long-term outcomes in clinical studies with different language and cognitive disorders. Further, data from the MBCDIs have been used to develop experimental studies, new assessment instruments, and clinical intervention programs.

Online Programs

Online programs have been developed that allow users to obtain information about the growth of individual words and word categories for the MBCDIs in English and a number of other languages. A first program is available on the Web site, the Lex2005, for English and Spanish. For Danish, Swedish, English, and Spanish, the Cross Linguistic Lexical Norm database (CLEX) is also available at www.cdi-clex.org/ (Jorgensen, Dale, Bleses, & Fenson, 2010). CLEX contains tables, graphs, and language comparisons based on the norms of each language. Frequencies of components in speakers of one language may be compared to another language. For instance, frequencies of adjectives used in Danish and English by monolingual speakers can be established by age. In the future, more languages will be added.

The uses of the MBCDI are extensive and work is continuously in progress on other languages and new forms.

Maritime English

ANA BOCANEGRA-VALLE

Maritime English is an umbrella term which refers to the English language used by seafarers both at sea and in port and by individuals working in the shipping and shipbuilding industry. Maritime English lies in the domain of workplace English. Merchant ships (and auxiliary craft) are used in the name of today's global trade to facilitate the worldwide haulage of freight among distant locations and the movement of passengers where other modes of transport are not appropriate, possible, or even cost-effective. Ships' crews and shipping-industry personnel are necessary to conduct a ship (and passengers aboard) safely to destination and deliver commodities efficiently while, at the same time, protecting the marine environment and safeguarding the financial interests of all relevant parties and stakeholders. The shipping trade is, by its very nature, a global phenomenon that evolves within a globalized economic and political framework and the involvement of many different countries, languages, and cultures in just one operation is common practice. The *Sea Empress*, for instance, a ship that polluted the Welsh coast causing severe environmental damage, was built in Spain, had a Norwegian owner, was registered in Cyprus, was managed from Glasgow, was chartered by a French company, had a Russian crew, was flying a Liberian flag, and carried American cargo. It is this background that has led Maritime English to gain worldwide recognition as the international language of seaborne trade employing internationally oriented individuals who need to be fluent in English for communicating successfully while on board and ashore.

Language Distinctiveness

Maritime English terminology and phraseology pose a real challenge due to their specialization and unfamiliarity: Passengers sleep in *cabins* and meals are cooked in the *galley*; a ship does not have walls but *bulkheads*; smoke comes out of a *funnel* not a chimney; objects are not positioned left or right but on the *port* or *starboard* sides; ships *make headway*, *sternway*, or *leeeway* when they move forwards, backwards, or sideways through the water; and when underway they may be *overhauled*, not overtaken, by faster craft. Orders such as *Single up to a backspring forward*, *Put engines slow ahead*, *Rudder hard-a-port*, *Slack away on the breastline until the stern is clear of the berth* or *Let go fore and aft*, require not only good professionals but competent Maritime English speakers if a ship is to be handled efficiently. Noteworthy is the peculiarity of ships to have feminine grammatical gender for seafarers (an in-service mariner would always call a ship *she*), which remains one of the most distinctive features of the English language as currently used at sea.

The Branches of Maritime English

Maritime English subsumes five different subvarieties according to the specific purpose they serve within the maritime context: English for navigation and maritime communications, English for maritime commerce, English for maritime law, English for marine engineering, and English for shipbuilding.

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

2 MARITIME ENGLISH

English for navigation and maritime communications (also known as Nautical English) is probably the quintessence of Maritime English. Seamanship, maneuvering, cargo work, or meteorology provide the subject-matter content upon which specialized language is developed. The English language used for maritime communications is mostly achieved through speech (face-to-face conversations, VHF radiotelephone, or broadcasting services), and occurs at two different levels:

1. *Internal (intra-ship or on-board) communication.* Master and deck crew must display a good knowledge of English to navigate the ship safely and efficiently, to carry out the ship's normal operations in a timely manner, and, in the particular case of cruise ships or ferry boats, to assist passengers. Likewise, personnel engaged on international voyages must be able to understand written English language signposted throughout the ship and contained in shipboard documents. In this respect, both the International Maritime Organization (IMO) and the International Labour Organization (ILO) require that the records of the ship be accompanied by an English-language translation when a ship's language is not English.
2. *External (inter-ship or ship-to-ship and ship-to-shore/shore-to-ship) communication.* Shipboard and shore-based personnel will be required to communicate with other vessels, traffic services, aircraft in case of search and rescue operations, and shore authorities. Particularly important is the need to display a good command of spoken English when one's vessel is in distress and requires urgent assistance and also to protect the health and safeguard the working conditions of all those aboard.

English for maritime commerce and English for maritime law share most of their linguistic and discursive features with business English and legal English respectively. English for maritime commerce is defined as "the use of English for the contracting, or offering for contract, the use of a ship for the carriage of cargo and/or passengers and all the ancillary services connected therewith" (Buelga & Wilson, 1994, p. 13). It covers the issues dealing with the use of English for all the commercial operations and transactions involved in the transportation of goods by sea, including seaborne trade, methods of payment, insurance and delivery of the cargo, shipping business finance and management, port organization, or export/import documentation. On the other hand, English for maritime law focuses on the legal aspects of such commercial operations and also on the legal aspects of the maritime adventure itself, including ships' contracts, limitation of liability, insurance claims, ships' ownership and registration, towage or salvage events, marine pollution control, and so forth. As a branch of English for occupational purposes, proper knowledge and proficient use of English for maritime commerce and law will make individuals ready to face the legal problems posed by ships, the seaborne business, and the sea itself in a context where "there is an inevitable foreign element in many questions, since ships and cargoes, by nature, travel between countries" (Grime, 1991, p. 1).

English for marine engineering and English for shipbuilding stand out as the most technical of the Maritime English subvarieties because they refer to the language used by marine engineers, ship designers, shipbuilders, ship surveyors, and other technical staff in charge of the design, operation, and maintenance of a ship's engines, equipment, and systems, as well as the construction and inspection of ships. Notwithstanding the relevance of spoken English at the workplace, the written language comes to the fore because marine engineers and ship designers mostly need the English language to write and understand reports, specifications, manuals, and technical documents. Because they deal with the technology of shipping, these subvarieties show the linguistic and discursive features of English for engineering.

Maritime English as a Global Language

At present, there exists undisputed international agreement on English as the required common language of seafaring and port operations. International bodies such as IMO, ILO, the International Association of Lighthouse Authorities (IALA), or the International Telecommunication Union (ITU) have strengthened the position of Maritime English through different regulatory instruments. Particularly important is Resolution A.380(X) adopted by IMO General Assembly in 1977 in virtue of which English was recognized as “a common language for international communications between ships and between ships and shore services.” This resolution paved the way to the worldwide use of the Standard Marine Navigational Vocabulary (SMNV), a set of standard phrases developed to cover the most important safety-related messages of potential use at sea (IMO, 1977). SMNV was updated in 2001 into the Standard Marine Communication Phrases (SMCP) to include the latest technological innovations which might lead to communicative events and also the new communicative situations arising from the worldwide increase of multilingual and multicultural crews as well as the demands of mixed-nationality groups on board larger passenger ships. The SMCP was adopted under IMO Resolution A.918(22) after recognizing that English is the *working language* for communications at sea and that the standardization of language and terminology used in the SMCP would enhance the safe navigation and operation of ships around the world (IMO, 2002).

Maritime English as a Human Factor

Probably due to its global nature, the transportation of goods by sea is one of today's most dynamic industries and, as such, a favorable ground for multinational/multicultural/multilingual communities to develop. In fact, it has already been reported that “a ship which would formerly have been manned by a crew of around 40 sharing the same language, could now be run by 17, with 17 different mother tongues” (Johnson, 1995, p. 127), that about 80% of the world's merchant ships operate with multilingual and multicultural crews (European Commission, 1999), and that these include several different nationalities (Kahveci & Sampson, 2001; Horck, 2005). In the particular case of multilingual crews, a proficient command of the English language in general, and of Maritime English in particular, is vitally important to overcome language barriers which can cause accidents. As with the case of English for the aviation industry, poor communication between crew members arising from misunderstandings and lack of confidence in the use of English as a common working language can be a threat to safe operation and, if not the primary cause, certainly a contributory factor to accidents of all kinds (Pyne & Koester, 2005). Significantly enough, it has been estimated that this is the case in approximately 30–40% (Trenkner, 2000) or even 42% (Hetherington, Flin, & Mearns, 2006) of shipping accidents reported, when an insufficient command or an inappropriate use of English as an occupational language in the maritime context, or both of these, have rendered crew communication ineffective and, hence, increased the opportunities of human error and the risk of misunderstanding that put life on board and the safe operation of a ship at risk.

Materials for Syllabus Design and Course Development

In addition to the above-mentioned SMCP, there are four milestones in Maritime English education which currently contribute to the planning and design of Maritime English courses for the training of prospective maritime professionals worldwide:

1. SEASPEAK (Weeks, Glover, Johnson, & Strevens, 1988), the essential English language for international use in radio communications at sea, is a pioneering work in the field of English for specific purposes (ESP) that brings together the work of two subject-matter experts (i.e., Master Mariners) and two educational linguists, namely Edward Johnson and Peter Strevens. It offers a set of intra- and inter-ship communication procedures, conventions, grammatical rules for constructing and organizing messages, standard phrases, and vocabulary in an attempt to (a) minimize communication problems arising from the misuse of English by non-native crew members and shore personnel, and (b) ensure that speech communications principally by VHF radio are “as precise, simple and unambiguous as possible, and that predictable areas of language confusion and error are avoided” (Weeks et al., 1988, p. x).
2. The International Convention on Standards of Training, Certification and Watchkeeping for Seafarers (STCW) (IMO, 1995) is a regulatory instrument that sets out, among others, the English-language standards and requirements to be met by a number of shipboard crew members. As such, it is the common baseline for Maritime English courses offered worldwide.
3. In the light of the STCW requirements, the IMO Model Course on Maritime English (IMO, 2000) offers a four-skill syllabus with both linguistic (grammar, vocabulary, and pronunciation) and maritime content (issues regarding the tasks that learners are expected to carry out in English when in service) so as to assist in the development of Maritime English learning programs for both prospective and in-service seafarers with an elementary to intermediate level of general English.
4. MarEng (2007) is an innovative Internet-based tool which has contributed to the implementation of information technology in today’s Maritime English courses. MarEng presents the voyage on board *MV Marina*, a virtual vessel, as an environment for different ships’ events and operations. Thanks to a wide array of practical exercises, learners are exposed and can gain access to the real language of the sea as used by today’s maritime professionals worldwide.

Materials Development for Multilingual Education

ITZIAR ELORZA ALDAY

Introduction

One of the essential elements for the organization of the teaching and learning process in any kind of educational setting is educational materials, that is, a “collection of resources, objects and *artefacts* that are specifically created to facilitate the development of educational processes in schools and classrooms” (Area, 1999, p. 190). This collection includes materials that “can be linguistic, visual, auditory or kinaesthetic, and they can be presented in print, through live performance or display, or on cassette, CD-ROM, DVD or the Internet” (Tomlinson, 2003, p. 2).

How do these educational materials come to be? Following Hutchinson (1987, p. 37), “materials are not simply the everyday tools of the (language) teacher, they are an embodiment of the aims, values and methods of a particular teaching/learning situation.” In this light, materials development would need to start from the broad end of the spectrum, always answering to a certain view of education and a theoretical framework regarding the teaching and learning process (in general or of languages). This framework brings to the forefront a choice of methodology and syllabus design that will finally lead to the creation of pedagogical resources, namely the materials themselves, with a related set of pedagogical, epistemological, linguistic, and technical criteria.

This entry concerns materials development in multilingual education. Following Cenoz (2009, p. 55), we will define multilingual education as “teaching more than two languages provided that schools aim at multilingualism and multiliteracy.”

This definition focuses on an aim that will demand an integrated treatment of all the languages in the school setting. That is, multilingual education needs a comprehensive approach and a joint perspective as regards the teaching and vehicular usage of all languages in the curriculum (Pascual, 2006). We find that this involves the following: establishing effective language-planning policies that specify the functions and spaces open to each language; integrating the approaches, methodologies, and syllabus used in the teaching/learning of all languages; and ensuring effectiveness in terms of the instrumental use of all languages across the curriculum.

Following on from the above, all educational materials designed for multilingual education need to be subjected to take on an integrated approach, both for the teaching of language(s) and for the teaching of other subjects through the means of language(s).

As for the latter, the development of materials for teaching through second languages (L2s) is a key issue for bilingual schooling and has become an important area of research in the world of content and language integrated learning (CLIL) implementation. General issues concerning the design of CLIL materials as well as specific resources that cater for different subject areas have undergone major developments in recent years (see, for example, Mehisto, Marsh, & Frigols 2008; Ball, Beobide, & Muñoa, 2009; Coyle, Hood & Marsh, 2010).

Referring to multilingual language teaching, the research and proposals coming from the world of L2 language teaching are all valuable references (see, for example, Bird, 1995; Richards, 2001; Tomlinson, 2003) but they rarely take into account the interlinguistic perspective that is a principal characteristic of multilingual language proficiency.

In this entry we will focus specifically on the characteristics of materials development for integrated multilingual language teaching. We will first present the main features of multilingual language education, then describe the different levels of the integrated design of language teaching materials, and finish with an appropriate conclusion.

Consequences of Multilingualism in Communicative-Linguistic Education

Nowadays, multilingualism is considered to constitute a dynamic process that reflects the communicative needs of speakers: The holistic approach (Grosjean, 1989), the multicompetence theory (Cook, 1995), and the dynamic model of bilingualism (Herdina & Jessner, 2002) all consider multilingual speakers as persons with a distinct communicative competence which allows them to interrelate in various ways the languages that they possess. The language proficiency of multilinguals will develop and change as a reflection of the sociocultural conditions in which they live, and will depend, above all, on the domains of use and the functions of the various languages in their everyday lives.

Following this perspective, multilingual education will need to ensure suitable training in order to meet any language needs that may arise in terms of the current and future situation of the students (personal, academic, and professional). The aim would be to form competent multilingual speakers: persons who are capable of effectively dealing with specific situations in diverse social contexts in the language(s) demanded by the situation, by making use of their knowledge, their skills, and their attitudes in a unified and integrated manner.

Materials developers who try to respond to this perspective will need to design language materials, not in parallel schemes, looking at each language per se, but rather in a speaker-centered joint planning. This involves the integration of the teaching of all the languages involved in a sole syllabus or curriculum, in a way that will make the best of, as well as foster and nurture, the unique interlinguistic skills of the multilingual student. According to Cummins's interdependence principle (Cummins, 1979), languages develop in an interdependent manner, that is, there is general language competence that administers comparison, contrast, and interaction among languages and which allows for the particular transfer of skills and metalinguistic knowledge acquired from one language into additional languages. Encouraging this main competence is essential for the purpose of developing an integrated and balanced multilingual competence.

Levels of Integrated Design of Language Teaching Materials

As stated, materials design which intends to develop multilingual competence needs to bring together the teaching and learning of all the languages which are subject to study in a single proposal, via the design of an integrated curriculum for the language area. This curriculum design will lead to the subsequent planning and sequencing of the teaching and learning processes through the development of teaching materials.

The conception of the integrated language curriculum has undergone a major developmental process in bilingual communities in the Spanish state through the introduction of a third language. This has been incorporated into the official language curricula of the different educational administrations starting from the early 1990s. Nevertheless, there are

Figure 1 Structure of the integrated language curriculum of the Basque Curriculum for Compulsory Education (© EHIK—Confederation of Ikastolas of the Basque Country (2009))

still few well-developed examples of multilingual language teaching materials that would embrace the different levels and spheres included in such a design. One of the most complete examples is the Basque-medium schools (“Ikastolas”) project and its underlying language policy (Elorza & Muñoa, 2008; EHIK, 2009). Its strength lies in its definition of a common integrated language curriculum and its design and production of complementary materials for the four languages present in the school setting.

The Basque Curriculum for Compulsory Education structures a common integrated language curriculum. The main competences in the area and the criteria for selecting the basic contents are the same for all languages included in the curriculum, thus ensuring their complementary development. The level of acquisition of each language is specified when defining the competences attached to them and, above all, defined by means of assessment criteria (EHIK, 2009) (see Figure 1).

Following this scheme, we can see that the process of integrating languages in a sole curriculum and the consequent creation of educational materials takes place at different levels.

1. *Defining common objectives and general competences for the area to be developed among all languages.* The main features of oral and written communication and metalinguistic awareness are common aims for all languages.

4 MATERIALS DEVELOPMENT FOR MULTILINGUAL EDUCATION

2. *Selecting the appropriate approaches and methodologies to be used in common in the teaching/learning of all languages.* The main focus of a speaker-orientated design is the development of language(s) in use. This emphasizes the need to take on new communication and discourse theories, leading onto methodological choices within the areas of communicative language teaching and learning.
3. *Establishing an integrated framework of contents.* This contains, on the one hand, the common contents that are susceptible to language transfer, and, on the other, the contents specific to each language. A variety of similar pedagogical proposals regarding the contents susceptible to transfer and complementary treatment are available from Zayas and Ferrer (1994), Pascual (2006), and Guash (2008). We can categorize these works into the four spheres necessary for complementary programming:
 - a. Development of oral and written skills for comprehension and production. General procedures and strategies for listening, speaking, reading, and writing should be shared and taught similarly in the different languages.
 - b. Knowledge of discursive situations and text genres. Although certain differences between cultures may exist, there is nevertheless a set of common characteristics relating to structure, organization of content, functions, and rhetorical resources within text genres.
 - c. Metalinguistic awareness as interdependent with language usage. Processes of observation, analysis, and conceptualization of the language system, as well as basic linguistic concepts to talk about language, can be learned in one language and then transferred to others.
 - d. Language attitudes and intercultural awareness. Representations of the different languages and cultures that bring about attitudes toward them, motivation to use or learn them, and personal choices of usage also need to be considered complementarily.
4. *Taking into account the functions and spaces open to each language in each socio-cultural environment and developing language planning accordingly.*
5. *Decisions as to the age of introduction of each language, the intensity of exposure and teaching time, the fields of communication and subsequent language uses and text genres that need to be contemplated in the syllabus for each language.* These are all essential to integrated materials design.
6. *Planning teaching units or working sequences in such a way that work done in the different languages can be complementary.* The starting point of the integrated planning and sequencing of materials would be the common features of the different languages that should be shared between the different language syllabuses. The identification of these common features would allow the secure introduction of new contents in the stronger languages, share the content load between more balanced languages, and generally avoid unnecessary repetition. To do so, it would be necessary to design a “map of contents” (Ruiz, 2008, p. 55) so as to organize all those procedures and concepts needed to develop multilingual competence and distribute text genres within the complementary planning of the teaching units. An example of the complementary planning of text genres in the Ikastolas’ project can be seen in Table 1.

Conclusion

The development of materials that can cater for the specific needs of multilingual education is a complex issue. To a great extent it depends strongly on an integrative perspective on the use and treatment of languages in the whole of the school setting. The approach to materials design for multilingual language teaching and learning needs to be comple-

Table 1 Integrated planning of the text genres and skills specific to the academic field

<i>Complementary programming of academic language</i>			
	<i>Basque</i> <i>3rd year of secondary</i>	<i>Spanish</i> <i>3rd year of secondary</i>	<i>English</i> <i>3rd year of secondary</i>
Unit 1	Expository texts: • Concept map • Outlines	Report: oral presentation	Expository texts: • Contrast and comparison
Unit 2	Expository texts: • Outlines • Summary • Oral presentation	Objective description: • Definition	Oral defense of a point of view
Unit 3	Didactic exposition	Didactic exposition Outlines and summary	Expository texts: • Cause–consequence

mented with a similar perspective on the teaching of other subjects through the means of other languages (CLIL). It is only by combining both fields of intervention that multilingual education can fulfill its aims.

Materials Development

BRIAN TOMLINSON

Introduction

If you wanted to learn a foreign language how would you do it? Whichever means of learning you chose you would almost certainly need to use materials to help you. These could be artifacts especially designed to facilitate language learning (e.g., textbooks, dictionaries, or computer games) or they could be authentic sources of “information” and experience (e.g., films, manuals, or novels). They could be informative in providing information about the language, they could be instructional in teaching language points, they could be experiential in providing experience of the language in use, they could be elicitive in stimulating use of language, or they could be exploratory in encouraging learners to make discoveries about the language for themselves.

Given how important materials are, it is amazing how little attention they have been given by applied linguists. It was not until the mid-1990s that materials development began to be treated seriously by academics. Before then it tended to be dismissed as something which practitioners did or treated as a subsection of methodology in which “materials were usually introduced as examples of methods in action rather than as a means to explore the principles and procedures of their development” (Tomlinson, 2001, p. 66). There were some books and articles in the 1980s which focused on such issues as materials evaluation and selection (e.g., Cunningsworth, 1984) but it was the books of the mid-1990s onward (e.g., McDonough & Shaw, 1993, 2003; Tomlinson, 1998, 2003a, 2008, 2011; McGrath, 2002) that stimulated universities and teacher training institutions to give more time to considerations of how materials could be developed and exploited to facilitate language acquisition. In that period, for example, the University of Luton in England devoted a master’s course to materials development and some universities began to teach materials development as a separate module on their master’s courses. At this time Brian Tomlinson founded the Materials Development Association (MATSDA), to run conferences and workshops and to publish the journal *Folio*, and such associations as the Japan Association for Language Teaching (JALT), the Malaysia International Centre for English Language Teaching (MICELT), and Teaching English to Speakers of Other Languages (TESOL) in the United States set up materials development special-interest groups. Nowadays there are a number of dedicated materials development master’s programs and most universities run materials development modules. Also there are numerous courses for teachers providing experience of developing materials as a basis for reflection on the principles and procedures which best facilitate language acquisition. In many countries doctoral students and teachers are researching factors which contribute to the successful development and exploitation of materials, and the findings of some of these studies have been published in Tomlinson and Masuhara (2010a).

Nowadays materials development is considered to be both a practical undertaking and a field of academic study. As a practical undertaking it involves the production, evaluation, and adaptation of materials. As a field it studies the principles and procedures of the design, writing, implementation, and evaluation of materials. Ideally these two aspects of materials development are interactive in that the theoretical studies inform and are informed by the actual development and use of learning materials.

What Materials Do Language Learners Need?

Many teachers argue that language learners need a dictionary and a textbook—the dictionary to help with new words and the textbook to provide systematic and focused instruction. There is no doubt that a dictionary can be very useful if the learners are taught to use it effectively but there has been considerable debate about the value of coursebooks. Proponents argue that coursebooks give learners a sense of system, cohesion, and progress, that they help teachers prepare their lessons, that they help learners revise, and that they provide administrators with a means of ensuring standardization.

Opponents counter that a coursebook is inevitably superficial and reductionist in its coverage of language points and in its provision of language experience . . . it imposes uniformity of syllabus and approach, and it removes initiative and power from teachers. (Tomlinson, 2001, p. 67)

Experiments are taking place in which the coursebook has been replaced by teacher-developed material, by computer software, by sources from the Internet, and by experience of language in use. But most language learners are still using coursebooks.

Should Materials Be Form or Meaning Focused?

Form-focused materials involve learners in deliberate and explicit learning of discrete target features of the language. Meaning-focused materials involve learners in such language experiences as reading stories, performing plays, and completing tasks in order to help them acquire language from comprehensible input and motivated use. Proponents of the latter (e.g., Tomlinson, 2008) argue that affective and cognitive engagement while experiencing language in use is the key to effective language acquisition. Most coursebooks now provide some meaning-focused tasks but continue to cater mainly to the perceived need for systematic presentation of discrete learning points (Tomlinson & Masuhara, 2010b).

Should Materials Be Contrived or Authentic?

Should materials be specially designed for language learners or should they be typical of those used by proficient speakers of the language? The argument for contrived materials is that by focusing on the target feature in easy-to-understand examples they make the learning task simpler. The argument for authentic materials (i.e., those not specifically produced for language teaching) is that they expose learners to language as it is typically used and that they prepare them for the reality they will encounter as users of the language. Most coursebooks favor the contrived-materials approach (at least at lower levels) as this is what most teachers and learners seem to think is the best way to learn a language. Some applied linguists though consider that exposing learners to language in authentic and comprehensible use can be more motivating and is eventually more likely to help them to become effective communicators outside the classroom.

Should Learners Be Asked to Practice or to Use the Language?

Language practice involves repeated production of a target item in simplified environments which have been controlled to help the learners to get the item right. Use of language

involves producing language in authentic situations which have not been simplified or controlled. In practice the focus is on getting the form and or function of a target item correct. In use the focus is on achieving effective communication. Some applied linguists argue that practice is essential in order to eventually achieve effective communication. Others counter that practice is superficial, that it can present an oversimplified and distorted representation of the language and that it does not help learners when they need to communicate in uncontrolled and unpredictable situations. They argue that materials should focus on providing the learners with opportunities to use the language for communicative purposes. It could be argued that practice helps learners produce correct but limited language quickly whereas use helps them to eventually use language effectively. Most language-learning materials provide some tasks requiring learners to use language but most of their activities (especially at lower levels) only require them to practice it (Tomlinson & Masuhara, 2010b).

How Should Materials Be Written?

There is obviously no right way of developing materials but a number of applied linguists have recently expressed concerns about how materials are typically developed. What little research there is (see Tomlinson & Masuhara, 2010b) suggests that many materials developers write materials intuitively from repertoire (i.e., they adapt activities which have worked for them before) and it is well known that publishers often clone the popular features of successful coursebooks when developing “new” materials. While this seems to make sense in terms of economy and face validity, a more principled approach might be more effective in facilitating language acquisition—especially if it involved the development of frameworks designed to satisfy universal criteria of language acquisition and local criteria of learner needs and wants (Tomlinson, 2003b).

Should Materials Be Based on Theories of Language Acquisition?

While it might seem obvious that language-learning materials should be based on theories of language acquisition, many publishers and materials developers would argue that they need to provide what teachers and learners want and are used to, and that applied linguists have not conclusively proved what best facilitates language acquisition. Consequently many coursebooks still do not apply some of the theoretical principles proposed by applied linguists (Tomlinson, 1998, 2011), especially those relating to learners needing opportunities for

- exposure to language in use,
- affective and cognitive engagement,
- noticing salient features of their input, and
- using language for communication.

Instead many coursebooks still rely on a presentation-practice-production (PPP) approach in which information is provided about a discrete language feature, which is then practiced in easy exercises and “produced” in guided activities. This approach has been popular with teachers for many years because it is systematic and focused and because it provides an impression of progress. It does however ignore the fact that language acquisition is delayed and gradual and requires frequent, motivated, and varied encounters with a language feature.

Should Materials Be Global or Local?

Most commercial language courses are global in that they are developed to be used by any language learner at a specified level anywhere in the world. The advantage is that the potential returns on the investment justify devoting considerable expertise and resources in developing a quality product. The disadvantage is that the materials are inevitably developed for an idealized target learner and cannot be expected to satisfy the needs and wants of any actual learner. Until recently this was a major problem, as in many countries teachers treated their textbook as a script rather than a resource and imposed materials on their learners which did not connect with the learners' experience of life nor with their learning situation. Nowadays though teachers are being encouraged to humanize their global textbooks by, for example, localizing and personalizing the materials for their learners through adaptation and supplementation (Tomlinson, 2003c). Also these days many ministries of education and large institutions are publishing their own materials. These have the disadvantage very often of not looking as professional and appealing as the global coursebooks but the considerable advantage of being able to explicitly relate to the learning environment of their users (Tomlinson, 2003c).

What Role Can Technology Play in Facilitating Language Acquisition?

For many years technology has played an important role in supplementing coursebooks and many language learners these days spend more time working at a computer, watching a television screen, or listening to a CD than working with a book. The advantages of making use of technology are considerable and include

- motivational and experiential benefits of the multimodal representation of the language,
- opportunities for listening to and observing proficient language users communicating,
- opportunities for revisiting language activities and experiences,
- opportunities for interaction with the medium,
- opportunities for personalization of the course by the learners, and
- being able to match the expectations of new generations of language learners.

Many people would also argue though that materials which use new technologies

- are often too expensive to buy and use,
- often simply repeat the activities of textbooks in less effective ways,
- sometimes dehumanize language learning by replacing interaction with teachers and fellow learners, and
- are often driven by the possibilities of the technology rather than by principles of pedagogy.

Most of the above complaints seem to be about the abuse of new technologies rather than their potential and it is likely that in the future more technology-driven materials will be developed which are economical, humanistic, principled, and effective. Chapelle (2001), Derewianka (2003), and Kervin and Derewianka (2011) offer good discussions about the potential benefits of electronic materials.

Conclusion

This entry has outlined some of the issues which make materials development such an interesting field to work in. Many of these issues, and such other issues as those discussed in Tomlinson (2001, 2010), may never be resolved but one thing that is sure is that the demand to learn languages and the use of new technologies in developing language-learning materials will continue to increase. It will be interesting to see if the content of the materials will become more authentic and if their activities will become more engaging and communicative.

Materials for Language for Specific Purposes

THOMAS A. UPTON

Introduction to Materials for Language Instruction

Tomlinson (1998) defines language learning materials as “anything which is used by teachers or learners to facilitate the learning of a language” (p. 2). Most people would recognize “materials” as including things like textbooks, workbooks, handouts, and even videos, CDs, and DVDs. Tomlinson’s definition of materials, however, also includes things like “newspapers, food packages, photographs, live talks by invited native speakers . . . anything which is deliberately used to increase the learners’ knowledge and/or experience of the language” (p. 2).

The role of materials in the language classroom is essential; it is hard to conceive how a language class could be taught without materials. As Hyland (2006) notes, materials provide most of the input that learners, particularly those in foreign language contexts, receive in the classroom.

Effective language teaching materials reflect, and are shaped by, a variety of factors. Probably the most important factors are the beliefs of the material developers and the teachers who use those materials. In particular, these include beliefs about how learners learn in general, how language learners best learn a second language (L2) in particular, and what the appropriate roles of the teacher and materials are in the learning process. Both Graves (2000) and Tomlinson (1998) describe basic principles of L2 acquisition that are directly relevant to the development, selection, and use of language materials and activities; these also reflect beliefs about how people learn in general and what the teacher’s role should be in using materials. Some of these principles are presented in Table 1.

There are various other variables that influence the design and use of language learning materials that are related to the teacher, the learners, and the context. According to Richards (2005, p. 1):

Teacher factors include the teacher’s language proficiency, training and experience, cultural background, and preferred teaching style. Learner factors include learners’ learning style preferences, their language needs, interests and motivations. Contextual factors include the school culture, classroom conditions, class size, and availability of teaching resources in situations where the materials will be used.

For example, an EFL teacher who learned English as a foreign language, who views language acquisition as primarily the mastery of discrete language skills, who is working in a cultural context that promotes rote learning and with students whose preference is to be as anonymous as possible in the classroom, and who has a class of 75 beginning-level students will develop, select, and use materials differently from a teacher whose characteristics and teaching context are very different. The materials used by teachers inevitably reflect beliefs about the nature of language as well as language use, not to mention beliefs about learning in general. It may be that teachers in some contexts have little control over the language materials they use (e.g., they may be assigned a particular textbook for a

Table 1 Characteristics of effective language learning materials based on principles of L2 acquisition (adapted from Graves, 2000, pp. 152–5; Tomlinson, 1998, pp. 7–21)

Learner Affect

- Materials should achieve impact.
- Materials should help learners feel at ease.
- Materials should take into account learners differ in affective attitudes.
- Materials should help learners to develop confidence.
- What is being taught should be perceived by learners as relevant and useful.

Learner Engagement

- Materials should require and facilitate learner engagement and self-investment.
- Materials should allow students to problem solve, discover, and analyze.
- The learner's attention should be drawn to linguistic features of the input.
- Materials should provide variety: in roles and groupings, in type and purpose.
- Materials should provide the learners with opportunities to use the target language to achieve meaningful communicative purposes.

Learner Styles and Preferences

- Materials should take into account that learners differ in learning styles.
- Materials should allow students the opportunity to progress at their own rate.
- Materials should not rely too much on controlled practice, but allow for creative use of language and learning through trial and error.

Learner Needs and Development

- Materials should draw on what students know (their experiences).
 - Materials should focus on (authentic) language needs outside of the classroom and expose the learners to language in authentic use.
 - Learners must be ready to acquire points being presented in the materials.
 - Materials should provide opportunities for outcome feedback.
 - Materials should take it into account that the positive effects of instruction are usually delayed.
 - Materials should help students develop specific skills and strategies.
-

course), and so the materials would reflect the beliefs of the administrators making those decisions; but teachers do have at least some control over *how* they use the materials they are given, and this *is* very much influenced by their own beliefs.

Language materials, of course, can serve a variety of different purposes both in and outside of the classroom. Hyland (2003, 2006) describes four principal roles that materials play in language instruction. The first role is to provide *language scaffolding* to support learners' understandings of how language is used. Materials with this role are designed to provide learners with the opportunity to discuss, analyze, and manipulate language that they are still learning, and to get constructive feedback on their efforts, in support of their language development. The second role of materials in language instruction is to serve as a *model*. In this role, materials provide representative samples that illustrate particular features, structures, or functions of the language being studied, for example different ways to introduce oneself to strangers. Third, language materials can serve as a *stimulus*. This occurs when materials provide ideas and contexts that stimulate and promote discussion and writing, encouraging students to make connections to their own experiences, articulate their ideas, and interact with others. The fourth possible role is *reference*; as opposed to materials that provide scaffolding and modeling, reference materials (e.g., grammars and dictionaries) are more directed toward information about language than the practice of language. Of course, a particular set of materials can serve any combination

Table 2 Possible forms of language learning materials

<i>Author</i>	<i>Material feature</i>	<i>Example/description</i>
Tomlinson (2001)	Linguistic	Text-based, like textbooks
	Visual	Videos and realia
	Auditory	CDs, videos, presentations
	Kinesthetic	Manipulatives, role plays
Richards (2001)	Printed material	Books, worksheets
	Nonprint material	Videos, computer software
	Both print and nonprint	Internet material
Graves (2000)	Pedagogically prepared	Textbooks
	Authentic	Written by native speakers for native speakers (e.g., newspapers)

of these roles at the same time. Tomlinson (2003a) provides a similar but slightly different description. He sees the roles of materials as being (a) *instructional*—informing learners about the language and providing classroom practice; (b) *experiential*—providing experiences with the language in use; (c) *elicitive*—stimulating language use; or (d) *exploratory*—helping learners make discoveries about language for themselves.

Regardless of their instructional purposes, language materials can take on a variety of forms. Table 2 lists some of the different ways that language materials have been described by various authors.

With this understanding of the characteristics, purposes, and features of language learning materials in general, the following section will discuss additional characteristics of materials, including their development and use, in language for specific purposes (LSP) contexts.

Materials for Specific Language Learning Purposes

The primary distinctive feature of LSP courses is that the content taught in the course and the teaching approach used are based on the specific needs of the learners for the particular context in which they are learning. These “needs” are determined for each course and program through a needs analysis, and the results of the needs analysis will have a direct influence on the language learning materials used for instruction.

As Tomlinson (2003b) has noted, “different types of learners need different types of materials . . . materials have to follow principles, criteria, and procedures which match the distinctive features of the target learners and the environments they are learning in” (p. 324). Barnard and Zemach (2003) argue that LSP/ESP (English for specific purposes) courses have much in common with courses targeting English for general purposes (EGP). They see EGP and ESP courses as being on two ends of a continuum, with “blurred boundaries” between them, and with ESP courses “more focused in their aims and mak[ing] use of a narrower range of topics” (p. 307). The example they provide is that a business English course is more specific than a general English course, a course on English for the travel industry is more specific than the business course, and courses on English for airline employees and English for airline engineers in turn are even more specific—although all the courses will still have much in common. It is easy to see, however, that a language course for airline engineers is going to have materials that are very different from the materials used for a general business English course because the language needs are more specific.

4 MATERIALS FOR LANGUAGE FOR SPECIFIC PURPOSES

In addition to the degree of course specialization described above, Barnard and Zemach (2003) highlight seven additional variables that impact the design and use of LSP materials. These are

- type of institution (e.g., company program or university);
- location (e.g., ESL [English as a second language] or EFL [English as a foreign language] context);
- classroom setting (e.g., conference room or classroom);
- technology (e.g., computers, Internet access, blackboards);
- learner qualities (e.g., proficiency level);
- makeup of class (e.g., similar/different proficiency levels);
- teacher qualities (e.g., experience, fluency in students' first language [L1]).

All of these variables should be considered as part of the needs assessment when developing, selecting, and using materials in LSP contexts. Most important, though, are the language structures and purposes that are distinctive of the specific language context.

Identifying Distinct Features of Language Use for Specific Purposes

One of the key features of LSP is the recognition that language used for specific purposes, and in specific situations (Douglas, 2000), has structures and functions that are distinct, regular, and identifiable. Various research methods have been developed to identify these language features. The two most common are corpus-based text analysis and genre/move analysis. Corpus analysis allows for the study of large numbers of texts. When specialized corpora are compiled using the texts (including spoken discourse) common to a particular context (say, legal briefs), this allows a variety of analyses to be made, including the identification of key words and common structures. Genre analysis looks closely at how language in texts is used to serve specific rhetorical functions, as well as the kinds of vocabulary and language structures that are typically used to express those functions. For example, research articles in a variety of academic disciplines have been analyzed to determine the types of rhetorical "moves" that are typically used by proficient writers in these disciplines.

Challenges With LSP Materials

There are many challenges in selecting or developing materials to use for specific language purposes. One "flaw" (among many) noted by Skeldon (2008) that has been common in materials published to support the teaching of English for science and technology (EST) is that the topics covered in EST textbooks often are either "boringly familiar" or "bafflingly new" (pp. 60–1). The challenge is to identify topics that students need, want, and are ready to learn, and which take into account the knowledge and experiences they already have, while recognizing and developing their limited English skills. Similarly, we need to be careful that we do not interpret students' limited English skills as necessarily meaning their knowledge about their field, or their intelligence, is limited; L2 ability does not reflect intelligence or ability in the specific occupational, professional, or educational context. LSP materials need to be at both the appropriate language and intellectual levels for the students.

Another challenge with LSP materials has to do with "authenticity." Some have argued that language materials should be as authentic as possible; for example, students studying legal English should be reading actual law briefs and other legal texts. As Graves (2000) notes, however, "using authentic material is problematic in the L2 classroom because it is not constructed to contain only the aspects of language the learner has encountered or

learned up until that point and so may not be entirely accessible to the learner" (p. 156). Graves goes on to argue that pedagogically prepared material is often necessary to provide the "stepping stones" to understand and use authentic material in real-world contexts—the point of the LSP class, after all. Richards (2005) calls this the "myth of authenticity" (p. 11), in that authentic material is not always necessary or even realistic, and in some instances is a "burden for teachers" (Richards, 2001, p. 253).

One challenge for many LSP teachers is that they often are expected to deal with specialized areas of knowledge in which they have not been trained. For example, most teachers who teach medical or legal English are not themselves trained doctors or lawyers; this adds to the challenge of developing meaningful language materials that are both appropriate for the language level and relevant to the learning context. Good LSP teachers successfully address this challenge with a thorough needs assessment that includes the analysis of the language typically used in these contexts, as well as by involving content specialists (through cooperation, collaboration, or team teaching) in the design of language learning materials for the specific purposes.

Choosing and Developing Materials to Teach Language for Specific Purposes

Barnard and Zemach (2003, p. 316) offer a "recommended sequence" for the preparation of language learning materials for specific purposes, starting with the needs analysis. This sequence is outlined in Table 3.

Typically, having identified the context, student needs, and language expectations for the course, most teachers turn first to published textbooks and other materials (such as things on the Internet) to try to find something that will address the language needs that have been identified. Unfortunately, the more "specific" and targeted the language teaching context is, the less likely that there will be any published materials that are appropriate for the LSP class, especially compiled into one textbook, since textbook authors and publishers have to write material and activities designed for broad, general audiences (Sheldon, 1987; Bell & Gower, 1998). Consequently, as Hyland (2006) notes, "an effective [LSP] teacher needs to be able to evaluate, adapt, and produce suitable and effective materials" (p. 96). Options that teachers have when they want to adapt published materials for their particular teaching contexts include the following (see also Maley, 1998; Richards, 2001; Hyland, 2006):

Table 3 A recommended sequence for identifying and preparing materials

-
- Determine the needs and preferences of the students and institutions/corporation.
 - Determine what sort of language contexts the course will focus on (e.g., lectures, business meetings).
 - Decide how to present the language in the course (e.g., topic, function, situation, grammar).
 - Determine what language skills and subskills to focus on, based on needs analysis.
 - Decide whether the syllabus should have stand-alone lessons/units, or ones that build on each other.
 - Based on the needs analysis, determine the types of activities that will be used in the course (e.g., individual, pair, group, whole class).
 - Decide on material design.
 - Prepare materials.
 - Pilot the materials; collect and collate feedback.
 - Revise the materials based on classroom experience and feedback.
-

- *deleting* material that is inappropriate, irrelevant, etc.;
- *adding* material or activities to better target the language expectations of the LSP context;
- *reducing or simplifying* material or activities to make them more appropriate or less difficult or to give them less emphasis;
- *modifying* materials or activities to make them more demanding or accessible to students, which can include
 - *extending* activities to emphasize the lesson focus;
 - *replacing* texts or activities with more suitable material;
 - *branching*—providing options to students for working through existing readings or activities;
 - *reorganizing* material to better fit teaching context or course goals.

Conclusion

Jones (1990) titled an article with the question, “ESP textbooks: Do they really exist?” His point was that materials appropriately targeted at meeting the specific needs of students in LSP contexts would not be marketable to a broader audience. Harwood (2005) more recently lamented that the “unsoundness of most [ESP] textbooks outweighs many, if not all, of the benefits textbooks can confer” (p. 158). Consequently, it is essential that LSP teachers be good material developers and adapters, able to provide materials that meet the specific needs of students. Dudley-Evans and St. John (1998) have expressed concern, however, about the ability of ESP teachers to develop appropriate language materials; they argue that “only a small proportion of good [ESP] teachers are also good designers of course materials” (p. 173). According to Dudley-Evans and St. John, ESP practitioners need to be able to do the following with materials:

1. select appropriately from what is available,
2. be creative with what is available,
3. modify activities to suit learners’ needs, and
4. supplement by providing extra activities (and extra input). (1998, p. 173)

In short, while LSP teachers can and should draw on a wide variety of published materials, it is particularly essential that they—more than most other language teachers—know how to identify, develop, and adapt materials to address the specific language needs they have identified for their students, taking into account the principles and best practices that have been outlined in this entry.

Materials Publication

H. PATRICIA BYRD AND CYNTHIA M. SCHUEMANN

Developing publication-worthy materials to meet student needs can launch a complementary career path for educators (Byrd, 1995). In many cases, teachers are initially motivated to experiment with materials development by creating handout supplements for published textbooks that guide much of the curricula in language classes. Then teachers often want to share their effective supplements with others. Google searches for almost any aspect of a language lesson result in overwhelming numbers of hits, especially for topics on English. The plethora of web-based resources is one reflection of the drive to share and “get published.” Clearly, there is great appeal in having one’s work used outside of an individual work setting. This entry explores ways to move beyond personal publication to professional publication. In addition to meeting student needs, another important motivation to publish is the creative pleasure of writing and producing a work for a larger audience. There is a balance between extrinsic and intrinsic motivation to write for publication. Deadlines, collaborators, and the careful eyes of editors, reviewers, and users, all influence the formal process, as well as the desire to share a talent and knowledge base. And, as authors become more seasoned, they realize that a third motivating factor is that they also seek to contribute works that will truly influence the teaching and beliefs of a community of practitioners. Sometimes a sense of legacy can be derived from publishing. Here we will consider how these three motivations—meeting student needs, being creative, and contributing to the field—influence materials writers. We will analyze differences between materials development and materials publication, respond to some common myths, and provide advice for aspiring materials writers.

Writing for Publication Compared to Writing for Individual Classes

Writing materials for use in classes has many features in common with writing materials for publication, as well as important differences. Similarities are tied to the goal of helping students learn a new language effectively, while differences are tied to an expanded audience including fellow teachers, the corporate nature of publication, and inherent project collaboration. The strongest link between classroom-based materials creation and published textbooks is that both are based on knowledge and skills about language instruction and materials development. While writing materials for their own students is the beginning place for most published writers, the two types of materials development are substantially different in motive and practice. Writing a textbook entails much more than collecting sets of activities that have been used successfully. A textbook must be a coherent whole, a set of information and activities that can be understood and used by others without the writer’s presence. The creation of this coherent whole is one of the most difficult aspects of textbook writing and often is the result of interactions with the many different people involved in the production.

A major challenge is having a clear sense of the broader audience. Studying other successful textbooks and talking with experienced authors and publishers can help clarify

what kinds of information and activities are valued. Ansary and Babaii (2002) reviewed a selection of published textbook evaluation checklists and text review articles to compile lists of systematic indicators of good ESL/EFL textbooks. For students, the following characteristics were frequently identified: (a) learning in meaningful pieces (unit by unit), (b) visuals, (c) reviews, (d) companion workbooks, (e) plentiful and varied exercises or activities for the classroom and at home with sample items and clear instructions, (f) periodic tests, and (g) companion media materials. A prospective author needs to consider the whole “package” when envisioning a writing project.

For teachers, Ansary and Babaii (2002) noted additional characteristics as important: (a) clear purpose and objectives for the complete textbook and each unit or chapter, (b) appropriate level and coverage, (c) logical organization and sequencing lending to syllabus development, (d) guidebooks with advice and answer keys, and (f) supplements. In terms of supplements, users will want test packages, handout/presentation templates, and electronic media/internet-based activities. Clearly, teachers and program heads are a primary audience to consider when writing for publication, as they are the ones who evaluate and select textbooks. This is a critical difference from authoring materials for personal classrooms where individual sets of students are the primary audience.

Deepening understanding of the teacher audience is not an easy task, or at least not a task that will be achieved quickly. Preferences can be learned by visiting colleagues’ classes and talking about needs for materials, by attending conference sessions and listening to ideas to discover what teachers find helpful from materials, and by participating in activities planned by associations of professional materials writers such as TESOL’s Materials Writers Interest Section. Further, thoughtful reading of the most successful textbooks in areas of personal interest can deepen one’s professional knowledge base of publications. While prospective authors may think they can do better, they need to be open to learning from successful books since there is something there that other teachers value.

Once a book proposal has evolved to a prospectus and signed contract, the corporate nature of textbook publication often comes as a shock to new writers. Many people have their hands on the product, including various types of editors and reviewers. A sign of this collaborative aspect of materials publication is the ownership of the copyright, in most instances the property of the publisher rather than of the writer. While taking constructive criticism can be an emotional challenge, accepting feedback from editors and reviewers generally leads to stronger materials. Writers learn where their ideas have not been understood and need clarification or expansion.

In the current market, textbooks more often are part of larger series; authors might be asked to write level 1 in a four-level composition series or level 3 in a four-level integrated skills series. The author must understand and accept a larger vision of the published materials, a vision that comes from series editors and/or from the publisher. Careful study of the prospectus and ruthless honesty with oneself about the plans for the series are necessary for a writer to avoid being caught up in a process that becomes difficult if not impossible because of fundamental belief differences about language teaching/learning or the characteristics of materials.

Myths About Materials Publication

A selected group of well-received ESL/EFL textbook writers recently provided information about what they have learned about publication over the years (K. Folse, L. Grant, M. L. McCloskey, J. Reid, personal communication, October 15, 2010). These discussions resulted in a short list of what we call “myths,” that cluster around two major topics: (a) what the work really involves, and (b) what can happen in relationships with publishers.

Myths about the work include: it won't take much time, you'll set your own hours, once you've turned in the final copy-edited draft your work is over and the publisher's begins, your work will be richly rewarded. In truth, writing a textbook is a multistage project that requires massive amounts of time, and many different people will expect to have an author's attention (and time) at various points along the way, such as when drafts are due, reviews have to be responded to, and promotional meetings at conferences must be prepared for and attended. While some authors do make quite large amounts of money, many find rewards in the satisfactions that come from publishing teaching materials that they feel proud of, even when sales may not be as strong or enduring as hoped for.

Myths about publishers include: you'll have the same wonderful editor throughout the whole project, the copy editor will focus on really important problems, the publisher does all the work required to promote your book, the royalties department will always calculate your royalties accurately. While there are knowledgeable and effective editors who remain with projects from beginning to end, the publishing world is often rocked by changes in policy and staff, and by the sale of companies resulting in shifting product ownership from one publisher to another. Authors have to be prepared to make new relationships and to re-explain their project to editors who are willing to be helpful but learning new jobs on the fly. Unfortunately, this lack of stability can lead to projects getting lost or withdrawn. A contract does not mean that the publisher must publish a work but only that the publisher has defined both what would happen if the book does get published and also the guidelines that govern refusal to publish a submitted manuscript. While problems can and do occur with publishers, most authors experience working with highly professional and helpful editors whose advice and guidance greatly improves their work. Finally, publishers expect writers to expend time and energy for numerous tasks other than writing and revising the materials. Much of the promotion of textbooks occurs at conferences where authors can help sales by participating in activities organized by publishers.

Advice on Becoming a Published Materials Writer

While writing a whole textbook is often what comes to mind when thinking about writing materials for publication, writing a whole book is not necessarily a good place to begin for new writers. It is important to first build knowledge about materials, publication, and publishers. The following list is based on personal experience and advice from others who have worked with major publishers in the USA. The basic idea behind these suggestions is that learning more about materials and publication through networking can inform one's own work and build a good reputation with potential publishers and colleagues.

Recommendations

1. Attend conference sessions on materials, especially publishers' sessions on new textbooks and series.
2. Become active in TESOL's Materials Writers Interest Section or a comparable group.

Results/Caveats

- Meet published writers and learn more about their work.
-
- Join a supportive community with influential ties and advice for novice writers, including listserve discussions of timely issues.
-

4 MATERIALS PUBLICATION

3. Write professional reviews by contacting publishers seeking commentary on proposed new books, new editions, or early drafts of book chapters.	Learn how to give insightful and constructive feedback. Notice what publishers are looking for and how manuscripts evolve. Build a reputation as an authority who can meet deadlines.
4. Present conference sessions based on classroom teaching materials and attend similar sessions by other experienced language teachers.	Keep notes about responses to presentations and areas where fellow teachers might be helped by new materials. Save time for questions and try to meet afterwards with interested teachers who attend.
5. Find out about the rules on using student work in publications.	Plan ahead to have the legal right to use any student samples.
6. Study potential publishers: (a) Analyze conference book displays and talk with representatives. (b) Find out special interests of different companies to discover which ones best match personal strengths. (c) Check publishers' websites for information for potential authors.	Learn what publishers require from potential authors to submit a proposal to the appropriate acquisitions' editor in the format required.
7. Read up on contracts.	A useful resource about contracts is the TESOL Material Writers Interest Section publication on contracts and its addendum (TESOL, 2005, 2010).

Finally, for writers to build knowledge of how teachers actually employ and evaluate textbooks a range of topics should be explored, including these three:

- Advice to teachers on selecting and using textbooks (Grant, 1987; Skierso, 1991; Byrd, 1995, 2001; Byrd & Schuermann, in press);
- Features recommended for language teaching activities (Mishan, 2004; Folse, 2006);
- The place of materials in the context of language teaching methodology and the characteristics of effective materials (McDonough & Shaw, 2003; Richards, 2001, 2006; Tomlinson, 1998, 2003).

We conclude with these last words for prospective authors. Publishing materials for language learners can enhance your role as an educator and broaden your knowledge in a multitude of ways. You learn about what is happening in language classes other than your own as you develop new relationships with colleagues, authors, and publishers. And, if you are lucky, your materials may have substantial impact on the field.

May, Stephen

TERESA L. MCCARTY

The son of a community worker and an Anglican clergyman, Stephen Andrew May grew up in Canterbury, on New Zealand's South Island, in what he describes as "a resolutely monocultural" and "faux colonial" environment (May, 2009). His father's profession granted him discounted tuition at an elite boy's secondary school modeled after the British public school tradition, Christ's College, where there was at that time (1970s) not only an absence of knowledge about Indigenous/Māori peoples, there was no teaching of New Zealand history at all. Importantly, this experience sharpened what would become his well-known critical perspective on language, culture, and education, fueled by the "unquestioned acceptance of the students' and their families' elite social class position and related cultural capital" (May, 2009).

Understanding—and interrupting—conjoined linguistic, social class, and racial inequalities have been the driving forces behind Stephen May's work as an educator and academic. Taking two bachelor's degrees—one in 1983 in English and linguistics from the University of Auckland, and a second with honors in linguistics from Victoria University in 1985—he went on to complete a teacher training degree in 1986 from Christchurch College of Education. One of the first students in his high school to go into the teaching profession, he taught English as a second language in Bangladesh, later taking a teaching position at a multiethnic working-class high school in Wellington, New Zealand. There, under the mentorship of Head of Māori studies John Manuel, May began learning the Māori language, laying the foundation for his career-long dedication to Māori language education and, more generally, to minority and Indigenous language rights. Frustrated by the persistent achievement disparities he observed among his "clearly able" Indigenous students (May, 2009), he enrolled in an MEd at Massey University in Palmerston North, hoping to use his ongoing education to make a difference in his students' life trajectories. There, under the supervision of David Corson, he completed a thesis on the multilingual-multicultural (English-Māori-Samoan) Richmond Road School in Auckland. This work convinced May that multicultural education *can* be a form of emancipatory praxis—an argument he developed in the book that grew out of his original Richmond Road study, *Making Multicultural Education Work* (May, 1994). In this book we see the beginnings of a prominent strand in his scholarly corpus: an insistence that theory be directed toward practice and that practice be theoretically informed. We also see a compelling demonstration of what Charles Frake (2007, p. x) calls "fine description"—ethnography that is "meticulous in construction, but . . . also grand in design." In May's case, the "grandness" comes from the tight coupling of the micro with the macro—the details of curriculum, pedagogy, and individual agency juxtaposed with the larger power regimes of which they are part.

Earning a PhD in sociology from the University of Bristol, May expanded his interdisciplinary expertise and the scope of his sociolinguistic inquiry, completing his doctoral thesis on Welsh language rights and revitalization (May, 1997). It was as a student and lecturer at Bristol that he deepened his focus on the politics of language education: "I learnt early," he states, "that discussions of language education are never just about language, or even education—they are always imbricated with the wider politics of representation, power, and inclusion/exclusion" (May, 2009). Influenced by Pierre Bourdieu's (1977)

construct of habitus (possibilities and constraints), political theorist Will Kymlicka's (1989, 1999) notion of differential minority rights, Brian Bullivant's (1981) concept of the "pluralist dilemma" (civism versus pluralism), and Corson's (1990, 1999) approach to language policy across the curriculum, May went on to publish his highly acclaimed treatise, *Language and Minority Rights*. A book of breathtaking conceptual and geographical scope—spanning language planning and policy (LPP) cases from Québec to Scandinavia, Catalonia, Wales, Australia, the United States, and New Zealand—*Language and Minority Rights* redefined the scholarly LPP landscape, arguing that while language is a contingent marker of ethnic identity it is nonetheless one of the sharpest instruments of the state for demarcating the boundaries of civic inclusion for people as *groups*. Here, May brings together theoretical insights and empirical data from education, sociology, political science, applied linguistics, and law to "unravel the complex dynamics that link nationalism, language, and identity" as they manifest in individual and group rights (May, 2001, p. 12). In the end, he calls for reimagining the nation-state to build on its inherent cultural and linguistic diversity, acknowledging the sociohistorical positioning of groups in society and according them self-determination in their identity construction and political participation. Education, he adds, is a key public space for realizing these liberatory outcomes. Recently reissued by Routledge (May, 2008), this widely cited book won the 2008 American Library Association Choice Outstanding Academic Title Award. The book is also the basis for several influential papers, including his theoretical treatment of language rights designed to "move the debate forward" (May, 2003, 2005a). A fully revised second edition is to be published in 2012.

As powerful and provocative as his theoretical work has been, May never strays far from the policy-practice interface and the transformational possibilities that drew him to academe in the first place. "I am fascinated by ideas," he reflects, "but not simply for their own sake. Much of my work has specific sociopolitical and strategic policy implications" (personal communication, November 4, 2010). In this regard he has been a clear-eyed advocate for well-implemented bilingual/immersion education programs, particularly for Māori and other Indigenous peoples. He is adamant that such programs be controlled by those they are intended to serve, noting the linked pedagogical and political potential of these programs to "change the rules" that have historically excluded Indigenous knowledges and parent-community participation in schools (May, 1998a, p. 292). In several guest-edited journals, he brings together scholars and practitioners representing multiple disciplines, Indigenous communities, and sites of practice to lay out the parameters of pedagogically sound Indigenous/minority education. In *Indigenous Community-Based Education*, May and his contributors provide comparative examples of grass roots education models in Canada, New Zealand, Norway, Australia, and the Americas (May, 1998b, 1999). In a 2003 theme issue of *Comparative Education*, May and coeditor Sheila Aikman take up "new possibilities and ongoing constraints" in Indigenous education, providing comparative cases from the United States, Amazonia, Sámi land, Central America, New Zealand, Australia, and India (May & Aikman, 2003). And in a 2005 theme issue of the *International Journal of Bilingual Education and Bilingualism*, May focuses squarely on Māori, outlining "key issues and challenges" in Māori-medium education and situating the analysis in the international literature on bilingual, immersion, and heritage language education (May, 2005b; May & Hill, 2005). Building on his influential report with Richard Hill and Sarah-Jane Tiakiwai for the New Zealand Ministry of Education (May, Hill, & Tiakiwai, 2004), this work shows conclusively the educational superiority of immersion programs in which 81 to 100% of instruction is provided in the Indigenous language.

This work lays the foundation for May's more recent research with Richard Hill, Cath Rau, and others on the academic benefits of well-implemented immersion programs. As May and Hill note in a recent ethnographic study, while Māori-medium education is

rightfully recognized as a model of good practice in language revitalization, there has been a dearth of empirical research on the educational effectiveness of these programs (Rau, 2005; May & Hill, 2008; Hill & May, 2011). Taking up the critical but under-researched issue of the transition from Māori to English literacy development, Hill and May show how educators at Rakaumanga, one of the oldest Māori-medium schools, have reshaped the school language policy to promote students' biliteracy development simultaneously with Māori language and culture reclamation.

This research seems to come full circle with May's early ethnography at Richmond Road showing that multicultural-multilingual education *works*, both as sound pedagogy and as a site of praxis. With more than a dozen books and 80 journal articles and book chapters to his credit, including a volume of the field-defining *Encyclopedia of Language and Education* (May & Hornberger, 2008), this theme rings loudly and clearly throughout May's work. In his most recent edited volume, with Christine Sleeter, *Critical Multiculturalism: Theory and Praxis*, this corpus is extended to considerations of critical multiculturalism for teachers in language arts, mathematics, humanities, and the physical and social sciences (May & Sleeter, 2010).

May is currently professor of education in the School of Critical Studies in Education, Faculty of Education, University of Auckland, and senior research fellow at the Centre for the Study of Ethnicity and Citizenship, University of Bristol. The convener of the internationally attended (and praised) Language, Education, and Diversity (LED) Conference series, May is founding editor of *Ethnicities* (Sage), associate editor of *Language Policy* (Springer), and a member of the editorial boards of six international scholarly journals. Having had the opportunity to collaborate with him on several projects, including his 2008 Fulbright Fellowship to Arizona State University, this author asked him where he saw his work and the field of applied linguistics heading in the future. He replied that interdisciplinarity is central to addressing questions of language, rights, and (in)equality, and to conveying the value of additive bilingualism in the wider public debate. "There is still an enormous amount of work to be done," he added, "and I remain committed to addressing these issues in as many academic, policy, and public forums as possible—almost as a public intellectual, if you like" (personal communication, November 4, 2010). Driven by a commitment to social justice, and ever respectful of the peoples with whom he works, May is indeed the rare public intellectual. On that prospect, we can all look forward to his work yet to come.

McCarty, Teresa L.

BRYAN MCKINLEY JONES BRAYBOY AND ERIN NOLAN

Born and raised in Columbus, Ohio, Teresa McCarty is the daughter of a high school English teacher and a homemaker and office manager, and the great-granddaughter of Irish immigrants. Known internationally for her research on indigenous education, minority language rights, and language planning and policy, she has worked with indigenous and minoritized communities throughout the world. By her own account, this work began shortly after she completed a bachelor's degree in anthropology at The Ohio State University, when, as a graduate student at Arizona State University (ASU), she was hired by the Fort McDowell Yavapai-Apache community to serve as their liaison to the off-reservation public school attended by the community's children. She vividly recalls her first day at the school. It was a cold January morning. Searching for the Native American program office, she found instead a group of native children huddled with their tutors—extended family members—on a stone bench in the breezeway. Although the district was receiving federal monies to support native students' academic development, their tutors lacked basic materials and office space, and instruction was occurring outdoors. These learning conditions induced a visceral reaction; it was, as she noted to us, a moment of significance that brought her face-to-face with the ways in which schools reflect and structure racial and social inequality. Although her work has broadened greatly in its geographical and theoretical scope, it remains solidly anchored in practice, with the goal of “driving a stake through the concrete realities of institutionalized racism and educational inequities” for minoritized children and youth (personal communication, December 30, 2010).

From 1980 to 1983, in the midst of her doctoral training, McCarty joined the staff of the Rough Rock Demonstration School, the first school to be controlled by native Americans. There, she studied the Navajo language and worked with Navajo educators to create a K-8 bilingual-bicultural curriculum. Her dissertation, an ethnographic study of bilingual-bicultural education in this Navajo community, received an outstanding dissertation citation from the National Association for Bilingual Education. Her early publications based on this study wrestle with the seemingly intractable dilemma of a neocolonial federal bureaucracy that both “enables and constrains genuine control over education by Native American communities” (McCarty, 1989, p. 484). This, and her ongoing applied and ethnographic work at Rough Rock, laid the foundation for her (2002) book, *A Place to be Navajo: Rough Rock and the Struggle for Self-Determination in Indigenous Schooling*. Described by reviewers as a masterful and principled model of outsider-insider collaboration, the Rough Rock story illuminates the “two-faces” of indigenous self-determination—the challenges and possibilities in remaking schools into a “place to be indigenous” on indigenous terms.

Earning a PhD in social-cultural anthropology from ASU in 1984, McCarty served with ASU's National Indian Bilingual Center and the Indian Education Unit of the Arizona Department of Education. In both positions, she worked locally and nationally with educators who were striving to use native children's languages and cultures as resources in school. She later joined the faculty of the American Indian Language Development Institute (AILDI), then a small summer program to support native parents and educators in developing teaching materials in their languages. Hired by the University of Arizona (UA) as an assistant professor of language, reading, and culture in 1989, McCarty worked with

O'odham linguist Ofelia Zepeda to secure a permanent home for AILDI there. For the next 15 years she and Zepeda codirected AILDI, helping to draft the 1990/2 federal Native American Languages Act as part of that work. Now an international program in indigenous linguistics and language pedagogy, AILDI has been recognized by the US Department of Education as one of ten outstanding programs for minority teacher preparation. The AILDI story is told in McCarty's publications with Zepeda and others (e.g., McCarty, Yamamoto, Watahomigie, & Zepeda, 2001), but perhaps most importantly in its impacts: populating indigenous-serving schools with native educators and infusing those schools with linguistically and culturally relevant curricula.

Over the course of her career, McCarty has served as department head, dean, principal investigator on large-scale federal grants, and codirector (with Bryan Brayboy) of the Center for Indian Education, a position she currently holds. She has been president of the Council on Anthropology and Education, editor of *Anthropology and Education Quarterly*, associate editor of *Language Policy* and *American Educational Research Journal*, and coeditor (with Brayboy) of the *Journal of American Indian Education*. She has been honored with awards for outstanding mentoring and research and with fellowships from the W. K. Kellogg Foundation and the Salzburg Seminar, and she has been appointed a Fellow of the American Educational Research Association and the Society for Applied Anthropology. When asked, however, she will say that the supreme joys of her career are her work with students (26 doctoral students completed and 22 in progress as we write) and with indigenous educators and communities. This is a personal philosophy of "paying it forward" that resounds throughout her work.

McCarty has published 13 books and edited volumes (with two forthcoming), 34 refereed journal articles, 49 refereed chapters, and many invited pieces of significance. Her award-winning book with K. Tsianina Lomawaima, *To Remain an Indian* (2006), broke new theoretical ground, offering an explanatory alternative to conventional analyses that liken policy shifts to the swings of a pendulum. As Lomawaima and McCarty point out, the pendulum model "describes, but does not explain, change over time" (2006, p. 6). Instead, they offer a theoretical model of the "safety zone" that links shifts in Indian policy, including language policy, to ongoing contests over cultural difference and its perceived threat or benefit to dominant national interests (2006, p. 6).

Often writing with indigenous colleagues, McCarty's other publications have addressed the multifarious role of indigenous literacies in endangered language contexts (McCarty & Zepeda, 1995; Watahomigie & McCarty, 1996; McCarty & Dick, 2003; McCarty, 2005), curriculum development for endangered languages (Coronel-Molina & McCarty, 2011), indigenous teachers as change agents (Lipka & McCarty, 1994; Begay et al., 1995), the hegemony of high-stakes testing (McCarty, 2008, 2009), indigenous knowledges and social justice pedagogy (Brayboy & McCarty, 2010), and indigenous youth as agents of language policy praxis (McCarty & Wyman, 2009). Much of this work demonstrates the fallacy of either-or, "mother tongue versus other tongue" paradigms and the academic superiority of well-implemented bi-/multilingual and heritage-language immersion programs (e.g., McCarty, 2003). Seeking to engage public policy in ways that foster social justice, she has also written policy briefs for the US Department of Education, Queensland University of Technology's Indigenous Leadership Institute, and ASU's Education Policy Studies Laboratory.

McCarty's most recent work, exemplified in her (2011) edited volume, *Ethnography and Language Policy*, calls into question the very concept of policy itself. As Blommaert (in press) writes in a review essay, McCarty and her contributors are not simply "adding" ethnography to the study of language policy, but rather reconceiving policy from a critical sociocultural and ethnographic perspective. The starting point in this framework is the

notion of language policy “as processual, dynamic, and in motion . . . the complex of practices, ideologies, attitudes, and formal and informal mechanisms that influence people’s language choices in profound and pervasive everyday ways” (McCarty, 2011, pp. xiii, 2). This approach interrogates policy as de facto and de jure, covert and overt, bottom-up and top-down. It also illuminates ethnography’s emancipatory potential to build “a world culture that is a moral community” (Hymes, 1974, p. 54, cited in McCarty, 2011, p. 16).

Teresa McCarty’s numerous books, articles, and policy briefs serve as testimony to her efforts to improve education for indigenous and minoritized youth and to address the need for LPP in those transformations. Equally important from her perspective, she has lived the LPP process, advancing official policies to promote indigenous/minority language rights and engaging in language planning “on the ground” with indigenous communities and schools. Her work shows the ways that minoritized communities might push back against linguisticism and institutionalized racism. Her current projects include working closely with the Fort Mojave Tribe of California to save treasured bird songs, a key to their language and culture, and documenting ethnographically the promising practices in a trilingual Navajo-Spanish-English school. While she is a prolific and influential policy scholar, actively contributing to and even redefining the LPP field, she is always guided by the pressing needs of communities who are often forsaken by the larger society. In short, Teresa McCarty is a warrior for language rights and indigenous/minority community self-determination.

In 2004, McCarty returned to the place where her career began—ASU—to accept a professorship in education policy studies endowed by Richard and Alice Wiley Snell. In attempting to address her career over time, it is evident that McCarty initially became interested in the interaction of federal policy with the day-to-day realities of indigenous children in school. As the contexts for this work have evolved, she has increasingly engaged, as a scholar, educator, and activist, in processes of language maintenance and revitalization. In recognition of this corpus of work, McCarty was awarded the 2010 George and Louise Spindler Award for distinguished and inspirational scholarly contributions to the field of educational anthropology. Presented at the annual meeting of the American Anthropological Association by the Council of Anthropology and Education, this is the most prestigious award in the field of educational anthropology. We can think of no one more deserving, and we anticipate much more “distinguished and inspirational” work to come.

McClelland, James L.

MARC F. JOANISSE

James L. McClelland (born on December 1, 1948 in Cambridge, Massachusetts, USA) is best known as a principal developer of the parallel distributed processing (PDP) framework of cognitive science. This paradigm has been highly influential in the development of many current theories of mental processes and representation. PDP emerged in the 1980s as a response to traditional symbolicist approaches to mental representations and processes. This earlier framework explained cognitive processes as the result of discrete symbols and rules that operate on them. PDP or “connectionism” was a major paradigm shift in this respect, providing a framework for understanding mental processes in a brain-inspired way. In conjunction with Geoffrey Hinton and the PDP research group, McClelland proposed a set of tools by which mental representations could be modeled using simple, neuron-like processing units. Mental states are modeled as patterns of activations across large sets of units. These groups of units are themselves arranged into large networks via parallel sets of weighted connections. These networks can then be used to transform patterns of activation in a way that simulates mental processes. Finally, learning occurs through the modification of connection weights, as a result of experience.

In 1986, McClelland, Rumelhart, and the PDP Research Group published the two *Parallel Distributed Processing* volumes, which outlined both the theoretical and computational foundations of the approach, along with a set of models that captured the biological foundations of a wide range of cognitive phenomena in the areas of learning, perception, thinking, memory, and language. The two volumes were a catalyst to the development of a wide range of additional models, and ultimately inspired a radical shift in experimental and theoretical approaches to understanding the relationship between the mind and brain.

McClelland's work has included the application of the PDP approach to a wide range of language phenomena. He attended graduate school at the University of Pennsylvania, where he obtained a PhD in 1975. His early research examined word superiority effect in visual word recognition, specifically the finding that readers can better identify letters in the context of words compared to when they are presented individually or in nonwords (Johnston & McClelland, 1974). This finding led him to develop, with David Rumelhart, a seminal model that specified in a computationally rigorous way how the visual system recognizes words. In the model, basic visual features are used to identify letters, which are in turn used to identify individual words (Rumelhart & McClelland, 1982). The model includes some desirable characteristics including fault-tolerance and the concept of recognition via the activation of discrete processing units.

In 1989, a collaboration with Mark Seidenberg led to the development of a new reading model that applied similar principles to a broader set of phenomena (Seidenberg & McClelland, 1989). The model simulates reading via the activation of units that code a word's orthography, which are in turn used to activate a word's corresponding phonological and semantic representations. It takes the radical view that lexical (word-specific) knowledge is not separate from letters, sound and meaning, but instead is an *emergent property* of how humans encode these three types of knowledge. The model has been highly influential in reading research, and has subsequently been applied to theories of reading development in children as well as for theories of acquired and developmental dyslexia (Plaut, McClelland, Seidenberg, & Patterson, 1996; Harm & Seidenberg, 1999).

DOI: 10.1002/9781405198431.wbeal0753

In conjunction with Jeffrey Elman, McClelland also proposed the TRACE model of speech perception (McClelland & Elman, 1986). This model simulates auditory word recognition via the perception of subphonemic features that subsequently activate phoneme- and word-level information. A central feature of this model is the inclusion of top-down activity to capture the influence of prior knowledge in word recognition. This differs from earlier models of speech recognition that proposed a unidirectional process in which auditory information was matched to phoneme- and word-level information in a purely sequential, bottom-up fashion (Marslen-Wilson, 1984). In contrast, TRACE simulates word recognition as a dynamical process in which perceptual knowledge and prior experience are integrated over time. It continues to be an influential model of speech perception in the psycholinguistic literature (Allopenna, Magnuson, & Tanenhaus, 1998).

In the 1980s, McClelland also collaborated with David Rumelhart on a model of English past tense (Rumelhart & McClelland, 1986); this model was to become what is perhaps the most controversial contribution of the PDP framework to language research. The model learns both regular and irregular past tense forms of English verbs, within a single mechanism. This was a radical departure from the approach taken by theoretical linguistics at the time, which sought to capture rule-like processes in language using deterministic rules, but which had much less to say about irregular cases that defy this characterization. The result has been a long-standing debate between the single-mechanism PDP view, and the ongoing rule-based view that proposes two mechanisms: one for rules and one for exceptions (for reviews of both perspectives, see McClelland & Patterson, 2002, and Pinker & Ullman, 2002).

More recently, McClelland's work has focused on developing models of learning and memory that are highly neurally plausible. A major innovation of the original PDP volumes was the development of the backpropagation algorithm that is used to train neural networks (Rumelhart, Hinton, & Williams, 1986). A drawback of this technique is its implausibility with respect to learning in actual neural systems. McClelland, McNaughton, and O'Reilly (1995) have proposed a connectionist model of memory that is neurally plausible and yields behavioral patterns consistent with intact memory formation, and patterns of selective impairment in amnesic patients.

Academic Honors

McClelland is currently the Chair of Psychology at Stanford University, and the founding Director of the Center for Mind, Brain, and Computation. Prior to 2006, he was Professor in Psychology at Carnegie Mellon University where he was also the founding codirector of the Center for the Neural Basis of Cognition.

He is a member of the National Academy of Sciences and the American Philosophical Society, and is also a fellow of the American Association for the Advancement of Science. He is a recipient of the William James Fellow Award from the Association for Psychological Science, the Howard Crosby Warren Medal from the Society of Experimental Psychologists, the Distinguished Scientific Contribution Award from the American Psychological Association, the Barlett lectureship from the Experimental Psychological Society, the Grawemeyer Award from the University of Louisville, the IEEE Neural Networks Pioneer Award, and the University of Turin Mind and Brain Prize.

He has served as associate editor or editor for *Cognitive Science*, *Neural Computation*, *Hippocampus*, *Neurocomputing*, and *Proceedings of the National Academy of Sciences*, as the president of the Cognitive Science Society and the Federation of Associations in Behavioral and Brain Sciences.

McKay, Sandra Lee

NANCY H. HORNBERGER

Sandra Lee McKay (1945–), professor emeritus at San Francisco State University and currently visiting professor of applied linguistics at Hawai'i Pacific University in Honolulu, has led and mentored in the field of language teaching internationally for more than 40 years. I first encountered Sandy's work in her groundbreaking 1988 volume *Language Diversity: Problem or Resource?* (coedited with Sau-ling Wong) and, at about the same time, in a short comparative, reflective piece she wrote for *TESOL Newsletter* based on her English-language teaching in the Philippines, USA, and South Africa (1989). Both of these bore Sandy's trademark clarity and field-shaping conceptual framing and became lasting resources for me in my own teaching and research. It was some years later that I first met Sandy, when she invited me to coedit *Sociolinguistics and Language Teaching* (1996), and we sat down over lunch at a conference to brainstorm the overall shape of the volume. Shortly after that, as editor of *TESOL Quarterly*, she also invited me to coedit, with Thomas Ricento, a special issue on *Language Planning and Policy and the English Language Teaching Profession* (1996). In both cases, working with Sandy to bring these volumes to fruition was easy, efficient, encouraging, and illuminating, thanks to her mastery of the applied linguistics field, her incisive and critical eye for originality, and, above all, her kind and caring approach to her fellow human beings.

I tell this brief personal story because I know from others that this kind of generous mentoring and support of colleagues is typical of Sandy, and has been throughout her long and prolific career. That career began with her 1967 BS in English and speech education, 1969 MA in American studies, and 1971 PhD in applied linguistics, all from the University of Minnesota, which in turn recognized their distinguished alumna with their Outstanding Achievement Award in 2004. Professor McKay began teaching immediately upon completing her BS degree and has taught ever since—first as a junior high school teacher in Minnesota, then as a remedial English teacher while at the University of Minnesota, after which she spent a year teaching at San Carlos University in Guatemala. Returning to the USA, she taught EFL/ESL at Georgetown University, Northern Virginia Community College, and Stanford University, while simultaneously completing post-doctoral studies in sociolinguistics and linguistics. She assumed her position at San Francisco State University (SFSU) in 1976, where she taught in the department of English for the next three decades. Recipient of a series of research grants at SFSU throughout her career there, she has also participated in research grants in South Africa (1999) and Singapore (2001–4). She is currently project manager on a US State Department English language materials development project and English language educators summer institute in Hawaii.

Indefatigable international lecturer, teacher, and English language specialist, McKay's initial visit to Guatemala in 1972–3 as a Latin American teaching fellow under the Fletcher School of Law and Diplomacy was only the first of several to Latin America, including Fulbright teaching and research fellowships to Uruguay in 1987 and to Chile in 2000. Her international involvements soon multiplied to every part of the world: a Fulbright to Hong Kong in 1985 was followed by USIA (US Information Agency) English teacher-training grants to the Philippines in 1988, Thailand in 1989, Thailand and Laos in 2001, and Malaysia and Singapore in 2008. USIA-sponsored English teacher-training work took

her also to South Africa both before and after the end of apartheid—in 1987, 1988, and 1997; and to Hungary (1986), Morocco (1990–1), the USSR (1991), and Latvia (1995).

In addition to her long-time teaching at SFSU, Professor McKay has regularly lectured at Temple University in Japan since 1990, offering courses on ELT (English language teaching) methods, sociolinguistics, and research theory and method. She has also served as guest lecturer at the Central Institute of English and Foreign Languages in Hyderabad, India in 1998, and at the Southeast Asian Ministers of Education Organization (SEAMEO) Regional Language Centre in Singapore in 1999, 2000, and 2001; and as consultant and adviser in the English Language and Literature Group at Singapore's National Institute of Education. She has been a frequent invited plenary speaker at international conferences in Japan, Korea, Laos, Thailand, Singapore, and China over the past two decades.

Author/editor of more than 15 volumes and 50 articles and chapters, McKay has made strong and lasting book-length contributions across the several intersecting areas of her research and practice in language teaching, especially in the fields of English as an international language (1992, 2002; with Bokhorst-Heng, 2008); teaching second language writing (1983, 1984, 1986); second language classroom research (2006); and sociolinguistics, multilingualism, and language planning (with Hornberger, 1996, 2010; with Wong 1988b, 2000). *Sociolinguistics and Language Teaching* (1996) has sold over 13,000 copies worldwide and has appeared in Chinese and South Asian editions and in Greek translation. McKay's coauthored 2001 article with Keith Chick in *Southern African Linguistics and Applied Language Studies* received the Thomas Pringle Award for outstanding educational research in South Africa, and her *Teaching English as an International Language* (2002) won the Ben Warren International Book Award.

The reach of McKay's writings is great, in both scope of vision and impact on the field of applied linguistics and especially English language teaching. At the core of her enduring contribution is her unshakable conviction that English language learners, whoever and wherever they may be, embody tremendous resources of their own in language, literacy, culture, and identity, resources that can and must be tapped in their learning and prized by the wider societies of which they are a part. Whether editing a volume on language minorities in the USA (1988, 2000 with Wong) or on sociolinguistics and language teaching (1996, 2010 with Hornberger), authoring a piece on second language learning among Chinese adolescent immigrants in the USA (1996 with Wong) or the positioning of multi-ethnic learners in post-apartheid South African schools in Durban (2001 with Chick), reflecting on the policy and politics of multilingualism in the USA (1988 with Wong; 1997) or internationally (1990 with Freedman), or writing about L2 composition ideology (1993) or the roles of culture and pragmatics in EIL (English as an international language) teaching (2003, 2005), the message of valuing multilingualism, multiculturalism, multiple discourses, and multiple identities rings through loud and clear in all her writing. This same conviction underlies Sandy McKay's mentoring and collegial interactions around the world. It is difficult to say, and pointless to conjecture, whether McKay's enduring, international influence on the field of applied linguistics comes mainly through her clairvoyant writings or through the hundreds she has personally taught and mentored over the years. Her lasting contribution is through both, and resoundingly so.

Measures of Lexical Richness

DAVID MALVERN AND BRIAN RICHARDS

Lexical richness is about the quality of vocabulary in a language sample. For some, this is equated with the variety of lexis, while for others it is a multidimensional concept. For example, Read's (2000) model consists of lexical diversity plus three additional components: the appropriate deployment of low-frequency, more difficult vocabulary (lexical sophistication); the relationship between content words and function words (lexical density); and a low error rate. In practice, however, researchers attempting to measure lexical richness have focused their attention on the first two measures.

Lexical diversity is a complex property that summarizes the range of vocabulary and the avoidance of repetition in the sample. It applies both to written texts and to transcripts of speech. Research and diagnostic applications of lexical diversity can be found in a wide range of linguistic fields, including first and second language acquisition, linguistic input and interaction, demographic influences on language performance, language impairment and delay, aphasia, schizophrenia, stylistics, forensic linguistics, and many more. Valid and reliable measurement of lexical diversity proves to be surprisingly problematic, however. Traditional measures have turned out to be seriously flawed, but more sophisticated recent approaches, based, for example, on mathematically modeling the likelihood of new words being introduced into the language stream, have produced more robust, valid, and reliable measures.

The simplest measurement, frequently used in the study of language impairment, is a count of the number of different words (NDW) in a (timed) language sample, but longer samples tend to produce a greater range of vocabulary and samples of different length cannot be compared fairly. Another more popular, but equally flawed, approach has been the type–token ratio (TTR). TTR is the ratio of different words (types) to the total number of words found in the sample (tokens). This measure is often attributed to Mildred Templin, a pioneer of research into first language development, who collected vocabulary data from 480 children aged 3–8 years. It appears, however, that Templin neither used the term TTR, nor calculated values for individual children. She merely commented that, for pooled data, there was approximately one different word for every two words spoken and that this ratio remained constant over the age range tested (Templin, 1957, p. 115). What gave TTR a spurious credibility and extended its influence was Miller's (1981) interpretation of Templin's finding. Miller claimed, "The consistency of this measure makes it enormously valuable as a clinical tool . . . if a normal hearing child's TTR is significantly below 0.5 we can be reasonably certain that . . . [it] is probably indicative of a language specific deficiency." This is surprising, as it would indicate that in spite of the considerably greater vocabulary known by an 8-year-old than that of a 3-year-old, there is no development in the capacity to deploy that increased vocabulary with greater variation. The anomaly becomes further apparent when it is observed that the TTRs of Shakespeare's plays are all well below 0.5 (varying from 0.142 for *Much Ado about Nothing* to 0.201 for *Macbeth*).

The problem is that taking a ratio simply does not compensate for the effect of larger samples (Richards, 1987), and the plays of Shakespeare are very large samples indeed. As more and more words are added to the sample, it becomes harder to avoid repetition, the type count (V) increases at a slower rate than the token count (N), and the TTR (V/N)

2 MEASURES OF LEXICAL RICHNESS

falls. In practice, the average TTR over a number of extracts of a particular size taken at random from any language sample decreases smoothly with increasing size of extract (see Figure 1), and all language samples do this. TTR is seriously flawed, then, as the larger the sample, the smaller the TTR.

Over a number of years various attempts were made to compensate for this. Some employed what was hoped to be a correcting factor. An example is Guiraud's (1954) Index, or Root TTR (Richness = $V/\sqrt{N}$). Others tried to linearize the TTR vs. N curve using logarithms, such as Somers's (1966) $S = \text{LogLog}V/\text{LogLog}N$. Unfortunately none of these fixes worked, and they are all also functions of sample size. It can be shown mathematically that Guiraud's Index, for instance, is a function of N which increases rapidly to a maximum, then begins to fall away toward zero. This calls into question the validity of using such measures to compare any samples of language that vary in length.

An alternative approach has been to find a mathematical model for the TTR, or V, vs. N curves that different language samples produce. An early attempt was made by Thomson and Thompson (1915), but it failed to yield a general equation for the relationship. Carroll (1938) suggested a solution based on Zipf's law: that if types were ranked in order of the most to the least common in a sample, then frequency $\times$ rank would equal a constant. The resulting equation failed to fit empirical evidence from language samples, however. Tweedie and Baayen (1998) analyzed these and a number of other similar proposed measures and showed that none was successful.

The key to developing a successful model was identified by Sichel (1986) when he pointed out that the vast majority of the words any one of us knows are hardly used at all. A few, mostly function words, are used with relatively high frequency; the word *the*, for example, is found in English on average seven times for every 100 words used. The distribution of the frequency of occurrence of the active vocabulary of any one person, then, is highly skewed toward the low-frequency end and is very long tailed as the frequency increases. Sichel modeled this probability of occurrence and derived the most successful mathematical relationship between TTR and sample length (N) to date. Building on his work, Malvern and Richards (2000) applied an approximation to this relationship for shorter texts which produces good fits to real texts and transcripts of a few hundred tokens, as typically found in samples used in child language studies or second language. Their formulation of the relationship is

$$\text{TTR} = \frac{D}{N} \left[\left(1 + 2 \frac{N}{D} \right)^{1/2} - 1 \right]$$

where D is a parameter characterizing the lexical diversity of each language sample. Others have confirmed a high success rate in testing this formulation against real language samples by measuring how accurately it models the actual TTR curves obtained from the data, and by investigating further indicators of reliability and validity such as internal consistency or relationships with age, amount of instruction, other vocabulary measures, and a variety of linguistic and developmental indices (see, for instance, Jarvis, 2002).

If we take a number of language samples, then, and calculate the average TTR for sub-samples of increasing size, the graph for each sample follows a falling curve. Some curves fall more quickly than others, but all are described by the equation above. The difference is that curves which fall rapidly have lower values of D and lie below curves which fall slowly and have higher values of D. This can be seen in Figure 1, and D is a measure of how high the curve for a sample lies. We can attribute meaning to this by considering the curves for language samples which display the extremes of diversity.

The most diverse use of vocabulary imaginable is when a language sample is without repetition at all; that is to say, as an additional token is added to the language stream it

Figure 1 TTR vs. sample size (tokens) for language samples of higher and lower lexical diversity

is always a new type never used before. The curve of such a sample would be the straight line $TTR = 1$, because at every point the number of types in the sample would always equal the number of tokens. This line is shown in Figure 1. It is at the top of the space where curves are possible and obviously no language sample could produce a graph which lies above it. The other extreme of the least diverse language sample we can think of is when a single type is repeated over and over again. No matter how long the language sample there is only ever one type used and the curve is that of $1/N$, which lies at the bottom of the permissible space—it is not possible for the curve of a language sample to be below it.

Curves for real language samples, therefore, lie in the space between these two extremes. The more slowly a curve falls and the higher up in the space it is, the nearer that sample is to the most diverse text possible. The more quickly a curve falls, the lower in the space it lies and the nearer it is to the least diverse text there can be. How high a curve lies depends on its value for D , which can, therefore, be used as a measure of diversity for the language sample that produced the curve. Samples which produce curves with high values of D exhibit high lexical diversity while those with low values of D have low lexical diversity. D does not just depend on the range of vocabulary found in a language sample, but also on the distribution with which the types are deployed. This is another advantage of D over traditional measures, as D distinguishes among the different arrangements in the repetitions found in transcripts which have the same TTR.

4 MEASURES OF LEXICAL RICHNESS

Malvern and Richards have operationalized the calculation of D for real language samples in a computer program called VOCD (McKee, Malvern, & Richards, 2000), which is freely available as part of the CLAN programs on the CHILDES Web site (<http://childes.psy.cmu.edu>); another version, D-Tools, is at www.lognostics.co.uk. These authors have illustrated the application of D to a variety of language sources, including first and second language acquisition, development in essay writing during schooling, and academic writing (Malvern, Richards, Chipere, & Durán, 2004). Others have made use of it in comparing across languages, bilingualism, language testing, diagnosing specific language impairment, and other conditions (see suggested readings for examples).

Measuring lexical sophistication (the deployment of a variety of low-frequency, difficult, or advanced words, as opposed to an overall range of different words) is just as fraught with difficulty as measuring lexical diversity. Simple measures that count the number of rare or difficult words and use these to calculate ratios or proportions are just as much a function of sample size as the lexical diversity measures discussed above (see Malvern et al., 2004). Laufer and Nation's (1995) lexical frequency profile allocates words to four frequency bands and shows the proportion of words in each band. These results are commonly reduced to a single sophistication measure that focuses on the items that fall outside the 2,000 most common words. However, even when researchers using this measure limit the analysis to a standard number of word tokens it has been criticized as lacking robustness (Meara & Bell, 2001). Daller, van Hout, and Treffers-Daller (2003) have developed Advanced Guiraud, an adaptation of Guiraud's Index that divides the number of advanced (i.e., less frequent) word types by the square root of the number of tokens. This has been applied by the authors and other researchers in several studies and has produced consistent results, even though it can be criticized on the same grounds as Guiraud's original. One curve-fitting procedure that both has theoretical integrity and produces a well-validated measure, even for small samples, is Meara and Bell's (2001) P_Lex. This outputs a value for the parameter lambda that serves as an index of word difficulty.

VOCD can also be used to measure lexical sophistication. Usually, there are not enough rare words in a sample to measure their diversity directly. But having calculated D for the whole sample, if the rare words are then removed, VOCD can operate on just the non-rare or basic vocabulary in the transcript and calculate D (basic). The difference, which Malvern and Richards (2009) refer to as RWD (rare word diversity), is an indication of the contribution to overall diversity by the rare words: $RWD = D(\text{all}) - D(\text{basic})$.

In summary, measuring lexical richness for whatever purpose is by no means as straightforward as many applied linguists have assumed in the past. Nevertheless, measures are available, including several not mentioned here, that can produce reliable and valid scores for both lexical diversity and lexical sophistication. Of these, it is not always possible to say which is "best." Validity is a property of how a measure is used and of the scores that are produced rather than of the measure itself. Thus, applying TTR or NDW to samples of a standard token size would seem a reasonable thing to do. Similarly, while using Guiraud's Index to compare samples that differ widely in size may not be valid, there may well be a range within which it performs more satisfactorily. Of indices such as D that perform well in validation studies, there may be no single ideal measure: In an investigation that included six indices of lexical diversity, McCarthy and Jarvis (2010) pointed out that different measures could provide complementary, unique information on the deployment of vocabulary in a text.

Measuring the Effectiveness of Second Language Instruction in Research

CHARLENE POLIO

An evaluation of second language instruction often includes some type of measurement of its effectiveness. Such measurement is found in studies of classrooms or programs that include quantitative assessment as part of their overall evaluation, or in research studies that experimentally compare different teaching techniques, either in the classroom or in the laboratory. The choice of which measures to use can be particularly vexing as one has to consider not only the reliability and validity of the measure but also the logistics of administering the measure, and, in experimental studies, the possibility of the measure being biased toward one of the groups in the study. Below are five different types of studies that might measure the effects of instructions.

Some studies focus on the implementation of a new program or of a new teaching technique or module in a real classroom setting where there is no control group (e.g., Rodgers, 2006). Such studies often use some type of quantitative assessment of the students' progress such as a general standardized language proficiency test, or a more skill-specific test. In these cases, the quantitative measures are often supplemented (and should be supplemented) with other, sometimes qualitative means of assessment such as classroom observations, student interviews, teacher commentary, or surveys in order to triangulate the data. For example, one may want to evaluate an immersion-type method of teaching foreign language for high school students (i.e., where the students' native language is not used). If a pretest and posttest are given, the test might show an improvement, but without a control group, one could not determine whether the improvement was due to the instruction or to some other factor (e.g., perhaps the students had access to the target language outside of class), or whether another type of instruction would have resulted in greater improvement. Nevertheless, a study without a control group is not useless. In fact, the tests might show, for example, that students' listening skills improved but that their reading did not. If other data are collected, such as teacher interviews, such data could confirm that the instruction improved the students' listening but not their reading. Data such as classroom observations could help explain the test data: Perhaps the teacher spent less time on reading instruction with the implementation of the new program.

Experimental studies (where students are randomly assigned to groups) or quasi-experimental studies (where students are not randomly assigned) that compare different classrooms comprise another type of study. Such studies may compare program-level differences (e.g., the distribution of instructional time; Collins, Halter, Lightbown, & Spada, 1999) or drastically different teaching methods. Early studies of language teaching compared methods such as the audio-lingual approach and total physical response (Asher, 1972). Comparative classroom studies raise several issues. First, if intact classes to which the students were not randomly assigned were used, the groups could be inherently different at the start of the study. A group that is less proficient, for example, will generally show greater gains in test scores (i.e., through regression to the mean). Second, even with random assignment, other factors could affect the outcomes of the instruction including the teacher, the classroom, and the time of day that the class was taught. Finally, even if all factors are controlled for and the groups are equivalent, the measure could be biased

toward one of the treatments. In the case of the studies comparing teaching methods, a test of listening comprehension would be biased toward the total physical response group whereas a test of grammar might be biased toward the audio-lingual group (Beretta, 1986).

Sometimes researchers study a specific technique in a classroom setting such as a method of error correction. In this case, all students would receive similar instruction but the way errors were dealt with would vary either by class (e.g., Sheen, 2007) or by having students randomly assigned to different treatment groups within each class (e.g., Sachs & Polio, 2007). Generally, if a treatment can be administered individually, such as with written error correction, random assignment is preferred so that the effects of the instructional technique can be attributed to the treatment, as discussed above. With teacher-fronted lessons, for example on classroom oral correction, however, one would need to vary the treatment by class. Choosing a measure to assess the improvement of grammatical accuracy, oral or written, seems simpler than measuring general proficiency, but even if one finds a reliable and valid measure of accuracy, it will not provide a comprehensive view of what is happening. Because error correction might cause students to fear making errors, it may have an additional negative effect. In the case of written error correction, learners' accuracy might improve but the complexity of their language might decrease. Thus, even if instruction focuses on a specific skill, it is important to obtain a full view of students' performance.

Research on specific instructional techniques is sometimes conducted outside of the classroom (e.g., Barcroft, 2009). This is particularly common when computer-assisted techniques are used and students are sitting at individual computers, or when different types of individual oral feedback, such as recasts versus explicit correction, are provided in an interactive pair activity. In these cases, random assignment is logistically easy, but the researcher still has the problem of making sure that the measures are reliable and valid. Another issue, however, and not related to measurement per se, is whether the study has ecological validity. In other words, could the instructional technique studied realistically be implemented in a real class? (See Gass, Mackey, & Ross-Feldman, 2005, for a discussion.)

The last, and least common, type of study is one where the researcher studies a specific instructional technique with an intact class but then creates individual tests for each student. These are often referred to as individualized tests or tailor-made tests. For example, Loewen (2005) studied the effect of incidental feedback on students' errors. The feedback was given by the teachers as errors arose in class. Because each student made different errors and received different feedback, individual tests were created to determine whether the feedback had an effect. Because such tests are administered individually, it is impossible to calculate standard measures of reliability (although one can and should calculate inter-rater reliability if applicable). Validity can also be a problem: In the case of grammatical errors, tests generally examine only explicit knowledge and not the learners' ability to use the structure.

In the various types of studies described above, researchers often include what is called a delayed posttest to determine whether the effects of instruction are temporary or persist over a longer period. For example, a method for teaching vocabulary may result in short-term learning, but those words may not be retained. The posttest may simply be readministered after a period of time or an equivalent version of the test may be administered.

In all five of the contexts above, one needs to determine exactly what construct is being measured and then one needs to find an appropriate measure. Briefly, the measure has to be reliable (i.e., consistent) and valid (i.e., measure what it intends to measure). For studies of programs, for example, the program of instruction may strive to improve students' overall language proficiency or, perhaps, just their ability to communicate orally in a specific workplace setting. For the former, one might be able to find a valid and reliable existing proficiency test. For the latter, one would want a test that targeted specific workplace skills. If no test existed, the researcher would have to develop a series of tasks and

develop a reliable way to score the students' performance. To give another example of a specific skill, one might wish to study the effect of a computer program that teaches vocabulary. A multiple-choice test could be piloted and checked for reliability, but it would be a test of only passive knowledge. The researcher might want to determine the students' ability to use the vocabulary on a speaking or writing task. This latter test would probably be a more valid assessment of the students' ability to use new words, but it might be less reliable because of the difficulty in eliciting the words and scoring the language samples. Finally, if tests were supplemented with surveys as a means of determining the participants' self-assessments or attitudes toward the instruction, the reliability and validity of such surveys would also need to be considered.

Media Interpreting

FRANCESCO STRANIERO SERGIO

Media interpreting (MI) falls under the domain of both interpreting studies and audio-visual or screen translation. The term MI mainly refers to television interpreting, although it also includes radio and newer types of electronic media and transmission such as Webcasting and other forms of remote interpreting (O'Hagan & Ashworth, 2002). Little attention has hitherto been paid to sign-language interpreting in media settings. A broad survey of television sign language in 17 European countries has been conducted by Kyle and Allsop (1997), and one on Austrian as well as other German-language broadcasters' services for the deaf and hearing impaired has been undertaken by Kurz and Mikulasek (2004).

MI embraces different kinds of situations and participation frameworks, ranging from face-to-face communication—with the interpreter actually taking part in the TV program as a full-fledged participant in the original interaction—to simultaneous interpreting (SI) of media events. A particular form of MI is simultaneous film interpreting (Russo, 1997), which represents an alternative to the mainstream modalities of audiovisual translation, that is, subtitling and dubbing.

Early instances of television interpreting include SI of the moon landing in 1969 and the Gulf War in 1991, which contributed to making the interpreting profession visible to the public at large worldwide. The recourse to an interpreter on screen (or only in audio) is just one of the ways in which language mediation is managed. The decision to use one modality rather than another (e.g., voiceover or SI) is made by broadcasters and program controllers according to program strategies, general channel broadcasting policies, TV genre (talk show, live media events, prerecorded interview, etc.), target audience, and the specific goals that the program director wishes to achieve.

Clearly SI is the modality that is best suited to the immediacy required in live broadcasting, and in particular to “breaking news.” This process has been dramatically accelerated by transnational satellite news networks, such as CNN and Al Jazeera. Live broadcast SI is used for speeches, soundbite statements, appeals, interviews, press-conferences, military briefings, presidential debates, interrogations, and newscaster reporting, which may be produced during planned events (e.g., political summits, elections, funerals, trials, Academy awards) or unplanned events (e.g., war coverage, natural disasters, terrorist attacks, *coups d'état*).

In the television setting, such a multiplicity of text typologies and discourse genres acquires distinctive features that make MI noticeably different from traditional conference interpreting (Kurz, 1996; Mack, 2001; Viaggio, 2001; Amato, 2002; Katan & Straniero Sergio, 2003). Similarly, talk show interpreting (Straniero Sergio, 1999; Katan & Straniero Sergio, 2001), though sharing many features of what is known as dialogue interpreting (Mason, 1999), can not be fully equated to other interpreter-mediated social and institutional interactions.

A distinguishing characteristic of MI lies in the “double articulation” of broadcast talk, in the sense that “it is a communicative interaction between those participating in the discussion, interview, game show or whatever and, at the same time, is designed to be heard by absent audiences” (Scannell, 1991, p. 1). This implies that the media interpreter

addresses a double audience: *on-screen* participants (the people in the studio, the newscaster or the host, and the guest on a talk show), on whom interpreting might have a visible impact, and *off-screen* participants (tele-viewers).

It is widely acknowledged that MI requires additional skills and a new professional profile (Laine, 1985; Kurz, 1990), or, as Bros-Brann (1993, p. 1) put it, “an entirely new mind set compared to everyday practice of conference interpretation and to what all of us have learned and taught in various schools of interpretation.” Talkshow interpreters, in particular, in order to comply with “the ethics of entertainment” (Katan & Straniero Sergio, 2001) should take on a multivariate mediation role, which includes a certain acting ability to “get into the part,” played by the host or the guest.

In terms of situationality and working conditions, live broadcast SI bears some resemblance with remote interpreting, in that the interpreter usually sits in a separate studio (though not always in a soundproof booth) and has no direct view of the speakers, but receives the visual input via a monitor. However, unlike remote interpreting, “interpreters would typically travel to the studio where interpretation takes place, although not always to the location of the speaking parties” (O’Hagan & Ashworth, 2002, p. 95). MI is thus a location-dependent form of interpreting which may (and frequently does) take place in a dislocated situationality, where participants do not share the same unity of place and, sometimes not even of that of time, as is in the case of prerecorded programs. Interpreters have no access to primary speakers who more often than not are not aware that an SI of their speeches is going on somewhere else in the world. The outcome of these speech events is independent of interpreters’ performances. Consequently, there is no feedback and hence no “resource enabling interpreters to adjust, remedy or fine-tune their interpretation” (Amato, 2002, p. 271). Outside those situations where a studio audience is present, interpreters can rarely check the effect of what they say on hearers. In a real meeting, participants closely follow the interpreter who is sitting in front of them (or through headphones), so that they can reply, express agreement/disagreement, accept/reject a proposal, vote on a motion, sign an agreement, and so on. Conversely, in MI there is an undifferentiated (invisible) mass with a more passive viewing.

Another constraint concerns speed and delivery. Conference interpreters—in Italy at least—are always given the text of the speeches by heads of state. Therefore they have at the very least a few minutes to prepare. However on TV, where politicians who count are more often seen, things are very different. Barring few exceptions (e.g., the Pope’s speeches) interpreters never have the opportunity to see the text. So they have to translate speeches either read or teleprompted at breakneck speed.

Décalage (or ear-voice span) and turn taking are not always strategies that media interpreters can decide autonomously. One of the main requirements of MI is to finish one’s interpretation at the same time as the speaker’s, or as close to it as possible, and at times even before the speaker (Viaggio, 2001). An interpreter may even be explicitly asked to wait a few more seconds before delivering her translation to let the audience hear the voice of the original speaker (Straniero Sergio, 2003).

The conference interpreter usually translates a number of speakers, one after the other, alternating with a booth-mate. Conversely, during a TV program, when there is more than one foreign speaker (whether physically present or virtual), the norm is “one speaker one interpreter,” irrespective of turn length. Moreover, interpreters are usually selected on the basis of the sex of the person/s to be interpreted for the purpose of voice matching. This may result in an unbalanced workload between interpreters.

Discontinuity and brevity are further important factors influencing the interpreter’s work. In a war or disaster coverage, SI of foreign TV broadcast news is frequently used intermittently to fill in the idle slots between correspondents’ reports and the comments made in the studio. Interpreters translate for a maximum of five minutes, then their voice

is faded out by the newscaster who hands over to a correspondent, leads into a report or sight translates news coming from international press agencies. The interpreter's delivery might also be interspersed by the newscaster who stops it to add some narration or to rephrase the interpreter's words (Katan & Straniero Sergio, 2003).

On television, SI often coexists with other audiovisual translation modalities (narration or free commentary, voice over, subtitling). It is, for example, quite possible for SI during a program to be reedited and subtitled or voiced over by another speaker—and unbeknown to the original interpreter. Sometimes this gives rise to hybrid forms of language mediation which may entail a redefinition of (but also a conflict between) the professional roles and the corresponding norms. This happens when the newscaster/reporter (in a media event) or the host (in a talk show) takes on the role of the interpreter or when the interpreter is assigned a quasi-journalistic role (Katan & Straniero Sergio, 2003).

A distinctive feature of MI concerns quality criteria. In conference interpreting, voice and other related parameters such as intonation, rhythm, fluency, and delivery appear to rank the least important aspects affecting quality. Conversely in MI, where *form* is preferred over *content*, these suprasegmental and paralinguistic elements turn out to be of overriding importance (Kurz, 1990; Kurz & Pöchhacker, 1995; Straniero Sergio, 2003; Katan & Straniero Sergio, 2003). Interpreters are expected to have good diction and a pleasant lively voice so that listening is comfortable for the audience. Moreover, on TV there seems to be less tolerance of foreign accents and other indications of non-native delivery. An exception to this rule is represented by American newscasters who, as Viaggio (2001, p. 30) reports, "will not tolerate an interpreter who does not suffer from the relevant foreign accent."

Admittedly, interpreters have to adapt to current broadcast standards set by professional speakers; and at least two generations of TV audiences have grown up with the standards offered by the voices of excellent film dubbing actors and TV voice-over professionals. It is these norms which drive the expectations for similar voice qualities from the interpreter, "whose voice has to be flexible enough to sound like a presenter, a sports reporter or even a deejay, as well as a politician, economist, scientist as well as a whole host of celebrities" (Katan & Straniero Sergio, 2003, p. 138). According to Viaggio (2001, p. 30), the media interpreter should also have "the cultural sensitivity of the community interpreter, the analytical keenness and background knowledge of the journalist and the rhetorical prowess of the seasoned communicator."

Television, in general, and talk shows in particular, feature a greater visibility and involvement of the interpreter as compared to other institutional contexts. Being literally in the spotlight, interpreters are expected not just to have the relevant cross-cultural communication skills but also exhibit good showmanship. The interpreter is often the object of explicit scrutiny and teasing. Her/his presence (both in the consecutive and the simultaneous modes) is a contextual resource for introducing new topics and vignettes, with ad-libbed sketches often playing on elements of farce, all of which exploit the fact that the interpreted event is "live." Moreover, given the fact that viewers are watching for enjoyment, the interpreter's performance is often part of the show. Off-stage, the interpreter is exposed to criticism by the mass viewing public. These include not only the (literally) millions of accredited armchair viewers, but also a small number of unaccredited eavesdroppers, colleagues, and the other professional interpreters who are likely to assess the quality of the interpreter's performance.

Indeed, a TV interpreter's professionalism may well be judged by the national press, the next day. Thus, for example, in a scathing article published in a respected Italian daily paper, *La Stampa*, the day after the funeral of Lady Diana, the author ungraciously demolished the SI of Earl Spencer's eulogy. The performance, according to the author, resembled that of "heavy breathing on a chatline." On another occasion, another Italian TV critic reproached the interpreter for having translated President Bush's expression "I am a liberal"

with “Sono un liberale,” rather than leaving the word in English. Other comments may concern the violation of the voice-matching principle (see above) as in the case of the three-hour long SI of Clinton’s deposition before the grand jury in 1998, when the former American president was translated by three women. On the other hand, critics and journalists may also express positive appreciation about interpreters. An emblematic case is that of Olga Fernando (Italy’s most popular media interpreter). To quote from the press (*Il Corriere della sera*, *Giornale di Sicilia*): “Ms Fernando has a good word for everybody,” she displays “delicacy,” “profound sensitivity,” “sympathy,” “emotion,” and “does not limit herself to a cold translation.”

Since MI gives great visibility and accountability to interpreters, it contributes in shaping not only the public image of interpreters, but, most importantly, the underlying norms governing their profession. Indeed, newspaper articles are “extra-textual sources” (Toury, 1995), providing a meta-discursive representation of the interpreter which “does not embody just a neutral description of intrinsic features, but presents a selected and hierarchised set of norms” (Diriker, 2004, p. 25). These norms convert the general values or ideas, shared by a community, into performance instructions which specify what is prescribed and forbidden, as well as what is tolerated and permitted in a certain behavioral dimension (Toury, 1995, p. 55).

Medical Discourse

RICK IEDEMA

Introduction

This entry addresses the discourse of contemporary western medicine. Modern western medicine occupies a unique and prominent position among cultures' attempts to defeat illness. Non-western or "shamanic" medicine relies on mystical experience and manipulation of signs or what Lévi-Strauss termed "symbolic efficiency" (Clarac de Briceno, 2006). In contrast, modern medicine is anchored to knowledge and practices whose principal aim is to intervene in the bio-physiological processes and functions of the human body that cause (or are assumed to cause) disease. Critical to remember is that medicine's origin lies in dissection of the corpse, and this origin has defined the philosophy and orientation, and therefore the discourse, which undergird modern western medical science and practice.

It will no doubt remain a decisive fact about our culture that its first scientific discourse concerning the individual had to pass through this stage of death. Western man [sic] could constitute himself in his own eyes as an object of science . . . only in the opening created by his own elimination: . . . from the integration of death into medical thought is born a medicine that is given as the science of the individual. (Foucault, 1973, p. 197)

Early (18th century) western medicine saw physicians interpreting patients' illness accounts and offering folk remedies and prayer (Porter, 1999). Only in the late 19th century did doctors move on from blood-letting and virulent poisons to opiate pain control, vaccination, anesthesia, antiseptic surgery, bacteriology, and increasingly sophisticated therapeutics. In the words of the William Osler, author of *The Principles and Practice of Medicine* (Osler, 1892), this medical progress

effected a revolution in our civilisation . . . a revolution which for the first time in the history of poor, suffering humanity brings us appreciably closer to that promised day when the former things should pass away, when there should be no more unnecessary death, when sorrow and crying should be no more, and there should not be anymore pain. (Osler, 1892, cited in Bliss, 2011, p. 53)

This congratulatory tenor gained force as the 20th century progressed. It was fueled by extraordinary medical achievements, such as the invention of insulin and penicillin. During this time, medicine put an end to inevitable death from diabetes, smallpox, and cretinism (Bliss, 2011).

At the same time, medicine and medical research began to attract government investments and public donations. This new capital enabled the medical profession to institutionalize itself into powerful colleges operating through hospitals, research centers and university-accredited courses (Porter, 1999). Each of these sites diversified medical discourse to serve the practicalities of clinical work, the techniques of scientific research, and the knowledge underpinning university teaching. This diversification was buoyed by medicine's progress that involved doctors in reaching more and more deeply into the human body—medically

(with new drugs), surgically (cf. Harvey Cushing's surgical miracles as reported in Bliss, 2011), and psychiatrically (Freud, 1962). But none of this progress would have been possible without an increasingly specialized medical discourse to track and map medicine's colonization of the body. Indeed, medical progress can be seen as "a reorganization in depth . . . of medical discourse [and] of the very possibility of a discourse about disease" (Foucault, 1973, p. xix).

This entry sets out the domain that is encompassed by western medical discourse. In exploring the depth and breadth of medical discourse, the entry has two aims: to summarize work that has analyzed the discursive and linguistic dimensions of the broad range of modern medical practices, and to make explicit the assumptions that underpin existing approaches to the analysis of medical discourse. In doing so, the entry draws on research published within and outside of the field of applied linguistics. This is to acknowledge that considerable work on medical discourse is published in specialist journals concerned with medical and clinical care.

The Domain of Medical Discourse

Even when focusing on western or modern medicine only, we note that medical discourse encompasses a vast and complex set of domains and fields of knowledge. These are here grouped into four aspects. First, there is the field of public health supported by *epidemiology*. Epidemiology measures the health status of populations, as well as causes of death, and the success of clinical treatments. Epidemiological discourse is best typified by formal statistical information prominent in scientific research reports and health department documents (Little et al., 2002).

Medical scientific discourse has over the years become increasingly reliant on epidemiological or large-sample-size studies. What drives medical science in these domains is "gold standard" research: the "randomized control clinical trial," a method designed to produce large-sample study findings and strengthen the formal evidence base of modern medicine (Chambers & Dopson, 2003). The impact of this scientific and epidemiological discourse on our knowledge of disease and health behavior has been considerable (Potter, Wetherell, & Chitty, 1991). For one thing, this discourse is critical to medical consultation. Epstein even suggests that "the Hippocratic art of passive observation could be replaced by active therapeutics only when diagnoses could include statistical considerations and when clinical correlations could be based on frequency" (Epstein, 1992, p. 26). A critical task facing consulting doctors therefore is to traverse the discursive divide between population-based statistical evidence and the individual patient's illness account (Jordens & Little, 2004).

Equally influential are epidemiological findings producing claims such as "green tea stops stroke," "red wine lowers blood pressure," and "fish makes you live longer" (Smith, 2008). These claims significantly affect people's buying choices and health behaviors (Evans, Rich, Davies, & Allwood 2008). Given the influence of such epidemiological claims, they provide a powerful weapon in the struggle against social problems such as drug use, excessive alcohol consumption, smoking, and HIV/AIDS. However, claims may equally exacerbate social problems if they deploy inaccurate or inappropriate representations (Bunton & Crawshaw, 2006). One dramatic instance is the 1885 smallpox epidemic in Montreal. This epidemic was in no small part the result of the public's response to the publication of views to the effect that smallpox vaccination constituted a health risk (Bliss, 2011).

Second, next to epidemiological discourse, there is the specialization of medicine into domains as varied as respiratory medicine, emergency medicine, neurosurgery, and general practice. Each of these domains harbors unique kinds of knowledge and practice. General practice has been extensively studied and analyzed in so far as the consults between

doctors and patients are concerned (Ainsworth-Vaughn, 2003). Among other things, these analyses have revealed the changing relationship between doctors and patients, manifesting the shift toward “patient-centered care” (Finlay & Sarangi, 2006). On the other hand, specialty or hospital consults have not received the attention they deserve, and neither has communication among clinicians (Iedema, 2006). Chapters in an edited volume titled *The Discourse of Hospital Communication* (Iedema, 2007) redress this imbalance to a degree, homing in on operating room planning of surgery, mental health care, anesthesia, radiology, medical management, and hospital nursing. Also important here is emerging research on hospital team communication and clinical handover, both critical aspects of medical discourse as it structures clinical care (Iedema et al., 2009).

Third, another important and fast-growing facet of medical practice and discourse centers on body tissue sharing and organ donation. The invasiveness and novelty that define what medicine can do to human appearance and capacity require much discursive justification and incur much ethical debate. If biomedicine was charged some time ago with *objectifying* the body (Illich, 1976), tissue manipulation and organ exchange implicate medicine as a prominent actor in a market where body organs and tissues are transacted as a result of a “*commodification* of the body,” often annexing discourses from marketing and advertising (Nelkin & Andrews, 1998).

Fourth, a considerable movement has sprung up around alternative or “integrative” approaches to healing. Integrative medicine encompasses approaches that question the *allopathic* worldview of western medicine (“attack that disease!”) in favor of seeking to restore the body’s internal harmony and balance (Anderson, 1999). The popularity of integrative medicine and its reliance on herbal drugs warrants close analysis of its discourse practices, yet few analyses are as yet available. In his earlier work, Fairclough was led to conclude that doctors within alternative medicine tend to conduct themselves with greater interpersonal attention to patients’ experience of care compared to conventional western medical practitioners (Fairclough, 1992).

Of the domains staked out above, an increasing number are being systematically subjected to linguistic and discursive analyses. Initially, analyses privileged the diagnosis, prognosis, and treatment processes found in general practice. They also targeted the scientific-technical aspects of medical knowledge production in academic settings. Analyses further illuminated how medical knowledge and findings tended to be represented in the public media. Only recently has the reach of linguistic and discursive analysis of medical discourse expanded into domains such as genetics counseling, surgery, psychiatry, emergency medicine, cancer care, and palliative care (for some of these see relevant articles in Brown, 2006).

The following section will review studies drawing on analytical orientations including applied linguistics, discourse analysis, conversation analysis, and ethnography. These studies are grouped into the following areas: medical scientific language; doctor–patient consultations, and medicine and the media. Given their importance to contemporary medicine, the entry then overviews other less frequently targeted areas (as far as the study of orientations covered here is concerned): (de)medicalization, medical bioethics, and medical bureaucratization.

Areas Within Medical Discourse

Medical Scientific Language

Analyses of medical scientific language reveal its increasing reliance on formal scientific-technical language since the 16th century (Gotti, 2006). Early medical language consisted of narrative exposés about patients’ afflictions and experiences referred to as “*consilia*”

(Taavitsainen, 2006). Over time, medical accounts became increasingly technical and statistical in nature (Atkinson, 1992). Today, medicine has a disease terminology catalog containing more than 6,000 disease classifications and a somewhat smaller number of medical treatments.

Medical knowledge is negotiated in text books and research journals, but it is only considered to be formalized when adopted by the Cochrane Library. This library brings together a large collection of studies that were done according to strict (gold standard) research-methodological criteria, and their findings are regarded as providing the final answer to medical questions. The studies at issue here warrant close analysis and critique, not least because there is a “need to discuss evidence not just as a static body of truth” (Chambers & Dopson, 2003, p. 180). Salager-Meyer offers probing analyses of aspects of the medical scientific research article in different languages (Salager-Meyer 2000).

Medical knowledge is also negotiated during case presentations (Anspach, 1988). Case presentations, descendants of the “consilia” referred to earlier, are written and spoken accounts about the treatment that specific patients receive and about the effects of that treatment. Montgomery Hunter critiques case presentations for their elision of the medical self by using passive voice. This is significant because the “case presentation is at the centre of medical education and, indeed, at the centre of all medical communication about patients” (Montgomery-Hunter, 1991, p. 51). The passive voice erases the doctor as person from their judgments about and contact with patients. Atkinson (1995) and Erickson (1999) illuminate how junior doctors are shepherded into the passive voice discourse of the case presentation.

Finally, medical knowledge is embedded in the medical record, chart, or notes. Traditionally, the medical record is a written file compiled from what medical, nursing, allied clinicians, and diagnostic services know about and do for the patient. Paper medical charts belonging to patients with chronic conditions can be inches thick and difficult to negotiate: “Mixed media—graphs, test reports, lists, and narrative entries in a strange language and in several unreadable hands—and the combination of brevity, repetition, and its narrative focus on physical phenomena render it [the medical chart] formidably uncommunicative” (Montgomery-Hunter, 1991, p. 89).

The medical chart’s functions encompass keeping a running record of services provided; handing over information to incoming teams; instructing other clinicians about what to do, and providing a resource for medical chart coders so they can compile a list of treatments provided. Generally, the medical chart is a legal document and what is written in the chart cannot be erased; this invests chart notations with special authority. Critical analyses and exegeses of the medical chart’s contents, design and use are now quite widely available (Hobbs, 2007).

Doctor–Patient Consultations

Historically, the doctor–patient consult plays a central role in medicine and this centrality is reflected in an abundance of analytical attention paid to the consult. Analyses have shown, first, that doctors tend to mobilize a medical regime of thinking and speaking that is quite distinct from that characterizing the patient’s lifeworld (Mishler, 1984). The special status of medical discourse allows doctors to display their technical medical knowledge, and thereby risk marginalizing patients’ concerns and understandings. This manifests in doctors initiating more new topics and asking more questions than do patients, while ignoring patients’ life experiences, including their demonstrations of pain and suffering (Waitzkin, 1989).

More recent analyses have revealed that patients become increasingly involved in co-structuring the dynamics of medical consults (Heritage & Maynard 2006). This work

confirms that medical practitioners are becoming less dogmatic about the authority of medicine, and more “patient-centered” by acknowledging the legitimacy of patients’ concerns about particular medical approaches and treatments. The rise in patient-centeredness has been demonstrated on the basis of decreased conversational dominance by the doctor, greater doctor responsiveness to issues pertaining to the patient’s own lifeworld, and shifts in gender positioning (Ainsworth-Vaughn, 2003).

For its part, the specialty (or hospital) medical encounter is found to be roughly similar to that in general practice, except that the former is “problem driven in terms of the domain of the specialty” (Barton, 2006, p. 741). What is further evident from analyses done of consults in specialty medicine is that interactions tend to involve a broad array of stakeholders: family, other specialty doctors, nurses, allied health clinicians (social workers, psychologists, nutritionists, etc.), and policy makers acting through guidelines and policies (Iedema, 2006). The delicate negotiations involved in giving these stakeholders a voice require increasing communicative acumen on the part of the doctor. Another important factor that affects the nature of such interactions is the growing reliance on medical technology (i.e., test results and imaging resources, Maseide, 2007) and of information technology (i.e., computerized media, Heath, Luff, & Sanchez Svensson, 2007). The authority that these technologies inject into medical discourse has been argued to lead to tensions for doctors having to engage in “patient-centered communication” and “shared decision-making” (Epstein & Street, 2007).

Finally, the question of whether one or more languages are utilized during these interactions has enormous consequences for the success of medical diagnosis and prognosis, and the safety of subsequent treatment. As there is considerable global migration among the public in general and among medical personnel in particular, doctors may find themselves in situations where their patients favor a language different from theirs, or they work in contexts where they are obliged to use a language other than their mother-tongue (in their role of “overseas doctors”). Roberts provides an overview of linguistic research in multilingual medical settings, showing a dearth of multilingual analysis (Roberts, 2006).

Medicine and the Media

Medical progress became a popular concern thanks to being publicized by radio and television, newspapers, magazines, novels, and movies, all celebrating its amazing achievements and hopeful promises. The celebratory discourse initiated by Osler in the 19th century was uncritically appropriated and amplified by the public media for several decades. As this discourse reached deeply into people’s everyday lives, it came to shape who they are, how they see and experience their bodies and life chances, and how they think about personal health, the risk of disease, and death and dying (Armstrong, 2002). Then, around the 1980s, and not in small part due to Illich’s thesis that medicine is responsible for many “iatrogenic errors” (errors caused by medical care and harming patients, Illich 1976), concern arose about the nature of the actual outcomes of medical treatment. Karpf documents the transition from predominantly supportive media coverage in the United Kingdom to more critical reporting of medical issues (Karpf, 1988). Karpf’s work spawned a surge of critical analyses of medical reporting (e.g., Lupton, 1994).

More recently, with the advent of the Internet, information about what medicine can and cannot do for us and what health risks we face as present or future patients is at our finger tips (Richardson, 2005). Here too, the ways the efficacy of medicine, medical treatment and hospitals are portrayed shape the public’s understandings and expectations of medicine’s actual and potential achievements. These portrayals are critical to how people understand and approach health and healing, but they are also critical to people’s changing identities

as health care “consumers” (Segal, 2009). Indeed, much like representations put out in the broadcast media, those found on the Internet have a variety of different effects, ranging from informing people about functional medical scientific treatments and promising research developments, to fueling unrealistic expectations about what doctors and health services can and should provide in the way of averting disease and death (Lupton, 1994).

(De)medicalization

Ivan Illich, in his book *Medical Nemesis* (Illich, 1976) brought together a range of arguments against modern western medicine. His book starts with the sentence, “The medical establishment has become a major threat to health.” This threat, he argued, resulted from “iatrogenic incidents,” or medicine-caused harm. Medicine-caused harm occurs when patients receive the wrong treatment: no care, the wrong care, or too much in the form of an “overdose.” It is only during the last two decades that medical (and nursing) practitioners have begun to be transparent about the rates of errors and incidents occurring as a result of their actions. The US Institute of Medicine (1999) put the general error rate at 10%, with between 1% and 2% of patients affected by errors dying or suffering permanent disability. These statistics put medical care among the top 10 causes of death. Following a number of high-profile publications announcing medical error rates, the 1990s saw medical discourse appropriate new vocabularies including “quality of care,” “(continuous) practice improvement,” “evidence-based medicine,” and “patient safety.” Now, doctors are responsible for not just providing care to individual patients, but for measuring care provided to cohorts of patients, evaluating it, and improving it (Iedema, 2006).

Illich’s thesis further charged medicine with “medicalizing” aspects of social life to the extent that citizens were denied ownership over their illness conditions. Emphasizing that people should not lose touch with “the art of suffering,” Illich critiqued the trend in western medicine toward “diagnostic imperialism”: “To discover a new category of disease is the pride of the medical scientist” (Illich, 1976, p. 92). Through medicalization, medicine turns what were personal and social issues into medical ones. Besides explaining the conversion of young children’s lack of attention, male baldness, and persistent fatigue into domains fit for medical treatment, medicalization is also evident in the growing number of drugs, diagnostic technologies, screening opportunities, and medical specialties.

In Illich’s view, the problem of diagnostic imperialism compounds with “diagnostic bias.” Diagnostic bias is evident in how doctors err on the side of identifying disease rather than attributing an ailment to natural decay, and deploying medical treatment rather than encouraging patients to skill themselves in “the art of suffering.” This push to deploy medicine and its discourse to all facets of human ailment inevitably exposes doctors to making more diagnostic and treatment errors. Errors in care and their management have recently become the target of discursive analysis and ethnographic observation of how clinicians deal with clinical problems and bad outcomes, or incidents (Hor et al., 2010). Closely related is another emerging area of discursive analysis: Do clinicians disclose their errors to patients? (Iedema et al., 2008).

Medical Bioethics

It was not medical errors, but violation of research subjects’ human rights and dignity that led to stricter regulation of medical research. Medical progress, celebrated for decades by the public media, attracted particular scrutiny when medical researchers turned out to have exploited patients in Tuskegee to benefit medical science, intentionally infecting them with syphilis. Bioethics became integral to medical discourse with the publication of Beauchamp and Childress’ *Principles of Bioethics*, first published in 1979 (Beauchamp & Childress 1994). From then on, medical practices and research had their methods and

proposals vetted and monitored by Internal Review Boards (United States), Clinical Ethics Committees (United Kingdom), and Human Research Ethics Committees (Australia).

The discourse of medical ethics is anchored to four basic principles articulated in *Principles of Bioethics*: respect for autonomy, beneficence, non-maleficence, and justice. These principles form the basis of much communication teaching in medical schools (Roberts, 1997). Recent critiques of bioethical discourse target its assumption that patients are self-steering, able, and autonomous choosers, unbothered by their afflictions and suffering (e.g., Mol, 2008). These critiques of patient autonomy are also relevant to how medicine constructs and communicates “patient-centeredness.” Mol reveals how the discourse of autonomous choice can run counter to patients’ interests and can be alienating for patients who need ongoing care and support (Mol, 2008).

Medical Bureaucratization

The rising costs, expanding services, and growing risks associated with modern medicine have meant that medical practice and discourse have become objects of scrutiny of bureaucracy and management. Iedema has described how the bureaucratization of medicine seeks to limit risk, and how bureaucratization is evident from the growing prominence in medical discourse of perspectives derived from economics and finance, policy regulation, accreditation (of health services), certification (of practitioners), insurance, management, quality assurance, and practice improvement (Iedema, 2006). These new perspectives reconfigure what used to be an autonomous medicine into a (discourse) practice that needs to be more accountable to other specialties’ teams, neighboring professions, health departments, and governments.

The overall effect of bureaucratization is that doctors are increasingly held accountable for managing medical processes, controlling budgets, satisfying patients, and monitoring outcomes. Doctors rationalize what they do by designing clinical care pathways and by developing procedural checklists (Lingard et al., 2005). As such resources and activities are designed and enacted by frontline medical practitioners, they are now increasingly in charge of monitoring and reshaping their own practice. Since, rather than being managed, doctors apply *self-management*, medicine is not just being bureaucratized, but “post-bureaucratized” (Iedema, 2006).

Conclusion

Medical practice has evolved a long way from the lone doctor attending at the patient’s bedside. The above overview of medical discourse has shown that medical advances, scientific research evidence, and medical accomplishments have played and still play a considerable role in shaping the public’s sense of what medicine can provide, and how to understand their own bodies. Only during the last two to three decades has the congratulatory tenor characteristic of medical discourse been problematized by media, ethics, and research references to unsatisfactory clinical processes and outcomes. This critical, regulatory perspective on medicine is reinforced by policy interventions imposed on doctors by bureaucracies and governments.

For reasons of space, this entry has touched on only the most prominent aspects of medical discourse as it operates in contemporary western societies. This approach leaves some aspects of relevant work unaddressed, some of which deserve a closing mention in this overview of discourse-linguistic research in medical settings. One concerns growing research into chronic disease and mental health care, targeting the intensifying debates and expanding discourses that inform these (e.g., Brown & Crawford, 2003).

Finally, medicine is coming to terms with the healing potential of effective and empathetic communication (Street, Makoul, Arora, & Epstein, 2008). It is here that applied linguistic research takes on a critical role: engaging in the analysis of in situ interaction in the search of communication dynamics and indicators to ensure these become more widely known and applied to benefit healing and well-being, both for patients and their clinicians.

Medical Translation

VICENT MONTALT

Translation can be classified in a variety of ways, mainly by type (technical, legal, etc.), mode (written, audiovisual, etc.), method (literal, free, etc.), and the nature of the process (professional, pedagogical, etc.). In the professional arena, medical translation refers to a specific type of translation that focuses on medicine and other fields closely related to health and disease such as nursery, public health, pharmacology, veterinary science, psychiatry, psychology, molecular biology, and genetics. Medical translation shares a considerable number of key concepts, methods, and resources with the different types of medical interpreting.

English is the main source language in medical translation practice because most biomedical research is published originally in English, and then transferred to clinical practice and education, and exported to other languages and cultures. For the same reason, English is an important target language: biomedical researchers from all over the world need to publish their results in English if they want to make them known to the international community.

A Brief Historical Overview

Medical translation has existed since the oldest forms of cuneiform writing on clay tablets in Ancient Mesopotamia. Archeologists have found a dictionary in Sumerian, Ugaritic, Akkadian, and Hurrian dating from around 1300 BCE containing medical information in its prescientific form, together with other kinds of data about mathematics, astrology, agriculture, and city administration.

In fifth-century BCE Greece we find the *Corpus Hippocraticum* (Hippocrates et al.), a body of texts that inspired further study and spread to other languages and cultures in subsequent centuries. Some 400 years later, Galen was one of many medical authors who based their work on the Hippocratic tradition and produced a vast body of medical knowledge which, in its turn, would be further studied and translated, giving rise to new knowledge beyond its original frontiers. Greek medicine was conveyed to Rome by translators, many of them physicians (Fischbach, 1993, p. 96), such as Aulus Cornelius Celsus, who lived in the first century AD.

In the ninth century AD much of Galen's work was translated into Arabic at the House of Wisdom in Baghdad—in particular, Hunayn ibn Ishaq translated from Greek and Syriac into Arabic some 129 works by Galen. According to historian of medicine López-Piñero (2000, pp. 81–2) the Arab world was crucial in the development of medicine in the Middle Ages. Between the eighth and ninth centuries, it assimilated the Greek tradition in combination with some elements of classical Indian medicine, all of which involved a great effort of translation into Arabic. The task of translators went far beyond just translating. As another historian of medicine has put it, “In order to make the Greek tradition more accessible, understandable, and teachable, Islamic scholars ordered and made more systematic the vast and sometimes inconsistent Greco-Roman medical knowledge by writing encyclopedias and summaries” (Savage-Smith, 2001).

Between the ninth and the 12th centuries, Arab translations were in turn translated into Latin, together with commentaries added by other Arab scholars in the intervening years (Montalt, 2005). The Christian Gerard of Cremona and the Jew Faraj ben Salim are two well-known examples from this period, in which the School of Translation of Toledo became the center of the Western assimilation of the Arab legacy. In the view of Savage-Smith (2001), medieval and early modern scholars in Europe drew upon Islamic traditions and translations as the foundation for their medical studies. It was, then, through Arab translation that the West learned of Hellenic medicine.

In subsequent centuries, medicine gradually turned into a scientific discipline and made huge progress, generating an ever-increasing amount of information as well as compelling needs for knowledge transference, international communication, and translation. In more recent times, health care is increasingly seen as a fundamental right and a basic social concern. In a globalizing world, translators need to respond flexibly to the challenges posed by changing needs in national and international health organizations. Paraphrasing Fischbach (1993, p. 100), we can say that translation has been the great pollinator of medicine throughout the centuries and across many different languages and cultures.

The Scope and Specifics of Medical Translation

Traditionally, medical translation has been viewed mainly in terms of highly specialized texts and the terminological problems posed by them. In current professional practice, however, medical translation is not restricted to highly specialized genres, such as original articles or review articles published in biomedical research journals, but embraces many other communicative events in contexts ranging from clinical practice to education to popularizations of all kinds. Online information for patients, commentary on videos of surgical operations used in medical training at universities, and television documentaries about medical innovations addressed to the general public all fall within the ambit of medical translation, which is no longer limited to the written mode but includes audiovisual and online, digital formats as well.

As far as medical knowledge is concerned, the core of medical translation is formed by the different specialties of internal medicine, obstetrics, gynecology, orthopedics, pediatrics, psychiatry, surgery, and pharmacology; that is, the prevention, diagnosis, and treatment of any disease affecting any part or function of any bodily system, including mental disorders. Medical translation also encompasses complementary and alternative medicine such as homeopathy, naturopathy, or acupuncture.

Some medical translations may involve such specialized topics that they are difficult for a translator without a medical background to understand. According to Montalt and González (2007, p. 20) the medical translator's priority is to deal accurately with factual complexity. Lack of previous knowledge can be a source of misunderstanding, which may result in translation errors that can have serious consequences for the health of patients. But as Wakabayashi points out (1996, p. 357), "lack of formal medical training is not necessarily an insurmountable obstacle to the budding medical translator. What is essential is not a medical degree, but a broad understanding of the fundamentals and knowledge of how to acquire, in the most efficient manner, an understanding of other elements as and when necessary." There are basically two ways of acquiring that knowledge: through documents and other resources and with the help of subject matter specialists. In the era of the Internet, there is an immense wealth of medical information available for the translator—most of it free—from online databases of research abstracts, such as Medline, to virtual communities of professional translators who share their expertise and resources and often work collaboratively.

The value of medical texts lies in the quality and relevance of the factual information they contain. The quality of medical translations, therefore, depends very much on how accurately and coherently the content of the source text is represented in the target text. It is characteristic of medical texts that they are seldom written by professional writers and by people whose mother tongue is English. Consequently, the quality of the source texts is often not as good as one would expect in other types of translation, such as literary or journalistic translation. Thus a critical and responsible attitude is required of the translator, whose main purpose is to write a target text that is reliable and truly functional for the target readership.

The task of the medical translator is also affected by the ethical code of medicine and health care. Making sure that no mistakes in the target text put patients' lives at risk is paramount. Confidentiality is also important, especially when dealing with histories, informed consents, or drug development documentation. Last, but not least, there must be respect, awareness, and sensitivity toward patients, whether this concerns their medical conditions or their linguistic and cultural backgrounds.

Medical Genres

Understanding the content of the source text is necessary but not, of itself, sufficient to produce reliable and adequate translations. Knowledge about how texts work formally, socially, and cognitively in the two languages and cultures involved is also required. For example, it is relevant for medical translators to know how patient information leaflets may vary formally according to different legislation in different countries or regions. The same can be said about highly specialized genres such as biomedical patents or original articles in research journals. Translators who are familiar with their typical structure, tenor, terminological usage, and other conventions can more confidently predict text progression and anticipate possible translation problems. They will have a better appreciation of the overall context and will find it easier to generate appropriate renderings for the target text and select more quickly from among them. Familiarity with genres can also be useful when adapting texts and writing original texts.

Medical genres can be grouped in four general categories: research, professional, educational, and commercial. Research genres are those used by researchers to communicate their findings and arguments: original articles, case reports, doctoral theses, and so forth. Professional genres comprise those used by health professionals in their everyday work: clinical guidelines, summaries of product characteristics, disease classifications, nomenclatures, vade mecums, and all the documents contained in clinical histories, among others. Educational genres are used to teach and learn in a variety of contexts, from university courses to domestic situations: course books, fact sheets for patients, patient information leaflets, popularizing articles, and so on. And finally, commercial genres, used in selling and buying products or services of all kinds in the medical and health-care sectors: drug advertisements, catalogues of medical equipment, press releases for new drugs, and so forth.

Medical Terminology

As far as understanding and translating specialized terms are concerned, knowledge of medical etymology is a crucial element. According to Halliday (1998, p. 199), "The Greek forms provided the model for scientific terminology in Europe; they were translated into Latin (which was fairly close to Greek both in its grammatical structure and its semantic

organisation), and the Latin terms were subsequently borrowed into the modern European languages.”

Nowadays the language of medicine is full of terms based on Greek and Latin forms. They can refer to parts of the body, such as Greek *kephalé* (denoting the head, as in “cephalalgia”), or Latin *mamma* (denoting the breast, as in “mammography”); to substances, such as Greek *lipós* (denoting fat, as in “lipidosis”) or Latin *adepts* (also denoting fat, as in “adiposity”); to position in space and time, such as Greek *epí* (denoting upon, as in “epidermis”) or Latin *dexter* (meaning right, as in “dextroderm”); to quantity, such as Greek *hypó* (denoting deficiency or below the normal, as in “hypocalcemia”) or Latin *super* (denoting excess or above normal, as in “superacidity”), to mention a few.

From the viewpoint of translation practice, there are two main tendencies in medical terminology: one toward standardization, the other toward variation. On the one hand, besides all Greek and Latin forms and terms, which are highly internationalized and vary only in spelling between modern languages, standardization also refers to all types of international classifications and nomenclatures, such as the International Classification of Diseases or the Nonproprietary Names of Pharmaceutical Substances, both published and promoted by the World Health Organization.

On the other hand, medical terminology is highly dynamic, constantly reflecting discoveries and innovations through neologisms. From the English-Spanish context, Navarro (2007, p. 3) states that “Each year thousands of medical neologisms are coined in English, and they must be rapidly imported into Spanish with a maximum of precision, clarity, rigor and accuracy.” New terms giving names to new realities such as immunostain, drunkorexia, cyberchondria, or upatient are frequent in medical texts and constitute one of the most challenging and time-consuming aspects of medical translation.

Variation can also be seen in synonymy and, to a lesser degree, polysemy. One of the commonest forms of synonymy in languages such as English are the doublets formed by technical names and their popular equivalents, such as “cephalalgia” and “headache,” or “hemorrhage” and “bleeding.” Such synonyms may be a source of translation problems because languages are not symmetrical in their use: for example, what in Spanish is considered to be low register may be perfectly acceptable in English in the same text genre (this is what Pilegaard calls “register mismatch,” 1997, p. 171).

Medical translators are the unseen, unsung but indispensable disseminators of medical knowledge. The challenges they face are great but the benefits they bring to society and humanity at large are immeasurable.

Mediated Discourse Analysis

JENNIFER L. WELLS AND FADHIL WONG

Mediated discourse analysis (MDA), developed by Ron Scollon (1998, 2001a) is a theory of human action. Scollon, among other scholars, saw an opportunity to gain deeper understanding of human actions through the exploration of the interrelationships of those actions with discourses or texts. Coming from anthropological linguistics and having a keen interest in intercultural communication, Scollon posited that all communication is based on action. Individuals act in the world and as they act, they may use language in order to perform action. In this view, saying an utterance is performing action just as using a saw to saw a piece of wood is performing an action (Scollon, 2001b).

Scollon built his theory by merging theoretical notions from critical discourse analysis (Fairclough, 1995), mediated action (Wertsch, 1991), and situated learning (Lave & Wenger, 1991). It is based on three principles:

1. Social action: Discourse is best conceived as a matter of social actions, not systems of representation or thought or values.
2. Communication: The meaning of the term “social” in the phrase “social action” implies a common or shared system of meaning. To be social an action must be communicated.
3. History: “Social” means “historical” in the sense that shared meaning derives from common history or common past. (Scollon, 2001a, pp. 6–8)

Uniquely in discourse studies, the MDA approach to understanding a particular discourse begins with the *action* that is taking place. This action is investigated within a broad perspective regarding what is relevant. Components that could influence or direct an action range widely, from the macro of the physical environment to the micro of an individual actor’s breathing and heartbeat. Time of year; time of day; geographical location; environmental factors such as light, sound, and space; proximity to other individuals; and physiological and metabolic rhythms—among many others—may provide a range of meaningful insights into action. The researcher attempts to review each separately to consider its context regarding and contribution to the discourse being analyzed.

There are five concepts that are fundamental to understanding this approach:

- mediated action,
- mediational means/cultural tools,
- practice,
- site of engagement, and
- agency.

The unit of analysis used in MDA is called the *mediated action*, which has three primary elements: the agent or social actor; the action the social actor is performing; and the objects, texts, or other tools the social actor is using. MDA breaks mediated actions out into two primary types: *lower-level actions* and *higher-level actions*, as detailed in Norris (2004). Lower-level actions are the smallest interactional meaning unit, such as a gesture, posture, or gaze. Higher-level actions have an opening and closing point, such as making a cup of coffee or signaling for a taxi, and consist of multiple lower-level actions happening simultaneously or in sequence, or both.

2 MEDIATED DISCOURSE ANALYSIS

To consider an action “mediated” means that the social actor is making use of one or more texts, objects, or utterances (language). Within the context of the analysis of the action, these elements are called the *mediational means* or *cultural tool(s)*. Norris and Jones (2005, p. 49) specifically define mediational means as “psychological ‘objects’ that mediate between agents and their social worlds.” Mediational means take many forms, but according to Wertsch (1991) fall into two primary categories: “technical tools,” material objects such as a dish, a computer, or a piece of furniture; and “psychological tools,” such as spoken language, iconography, symbol systems, and other forms of abstract communication.

Put another way, mediated actions are the stuff of everyday lives: We are all performing mediated actions all the time. When a person (social actor) speaks aloud, they use the mediational means (or cultural tool) of language; what they say, and how they say it, becomes a text that can be analyzed and understood. When the social actor sits down in a chair, the chair becomes the mediational means; we can observe the chair’s position, the actor’s posture, and so on, to understand their behavior. When the social actor stands up from the chair and pushes it aside, the chair then transforms into a *frozen action*, a historical action represented by a physical object in space and time.

Many mediated actions are so routine as to become habitual, either within a specific group of social actors or, more widely, commonly performed and understood among populations at large. This is what is called *practice* within MDA, and as technical jargon relates to general language, so practices can vary from something understood by relatively few, such as the correct fingering technique to produce a musical scale on a piano, to something more widely recognizable, such as using a telephone or making a purchase.

The concept of practice was defined by Bourdieu (1977) as action with a history. Scollon (2001a) refined this definition of practice as the same social action that is recognizable by another social actor, representing a historical accumulation within a person’s habitus or historical body throughout their life experience. Norris and Jones (2005, p. 97) go further, stating that practice is “real-time mediated actions that have been linked to other actions in ways that are recognizable to a particular group of social actors.” Even though the action or actions might be performed under different circumstances and by different social actors, the actors themselves can recognize them as “the same.”

Scollon (2001a) uses as an example the act of handing, which is an action with nearly universal comprehensibility; even though it might be a person we have not previously met “handing” us an object we have not previously handled, the action itself is implicitly understood. Just as social actors from widely diverging backgrounds can easily understand the action of handing, so can a social actor from a specialized group such as a pianist understand the contextual meaning of another pianist’s movements. A *community of practice* describes a group of social actors bound together by a common understanding of a specific set of practices. Communities of practice are nearly unlimited in scope, and may be formed around broad understandings of practice, such as “handing,” as well as around more specific practices, such as “the Suzuki Method” of studying piano or participating in an organized sport.

Mediated actions always take place within a *site of engagement*, “the intersection of social practices and mediational means that enables a mediated action to occur” (Norris & Jones, 2005, p. 139). Quite literally, a site of engagement is a particular moment in time, taking all components of that moment into account: location, participants, environment. It is impossible to repeat a specific mediated action exactly, as the convergence of circumstances can occur only once in that precise way, and the MDA approach considers the social actor’s conscious and unconscious use of time and space as crucial to the comprehension of the action. Therefore it is key to the investigation to determine what elements of the site of engagement are most relevant to the understanding of the mediated action being studied.

Agency and free will are part of each social actor’s identity, and are exemplified by the

choices that actor makes. Each of us sees and experiences the world differently, as a result of the myriad differences that make us unique individuals. Individual agency is directed by the choices we have made as well as the experiences we have had, which guide us into specific perceptions of the world around us as well as how we act relevant to those perceptions. There is always tension between an individual's agency, their habitus, and their actions; a social actor may discover an affinity for certain activities as a child, leading them to pursue those activities to the exclusion of others as they mature. So the choices a social actor makes as an adult are not only directed by the deliberate historical choices they have made, but also by the activities those choices excluded.

The role of agency in MDA is expanded somewhat from other disciplines, in that the agency behind elements beyond the individual social actor is considered in the investigation. Agency is always distributed among the social actors, as well as contained in each specific mediational means and practice included in the mediated action. For example, social actors will comprehend the editorial perspective in a particular newspaper differently, depending on their own historical experiences.

Scollon's (2001a) continued exploration of MDA led him to investigate increasing complexities at both the macro and the micro levels, investigating multiple social actors in the context of varying timescales, which he termed *nexus analysis*. Nexus analysis looks at mediated actions as part of extended dialogues encompassing many different discourses: sociopolitical, individual, textual, visual, intergenerational, and so on. A nexus analysis can take many forms; it can consist of combinations such as close analysis of texts, semiotic analyses of visuals, interaction order, and ethnographic observations. However, perhaps the most critical element of nexus analysis differentiating it from other approaches is the emphasis on the use of the ongoing research to raise awareness of the issue and effect some form of social change regarding the surrounding social practices.

Due to MDA's flexibility, a number of researchers have recognized the potential of this approach for investigating a wide range of issues and practices across a variety of disciplines. It is now being used as a method to review a diverse selection of social discourses around the world. Regarding the investigation of individual social actors, Shroyer (2004) and Castillo-Ayometzi (2007) are interested in how individuals move beyond their historical bodies and replace old practices with new ones (Scollon, 2001a). Castillo-Ayometzi (2007) investigates the ways in which undocumented immigrants in the United States are influenced by Baptist missionaries while seeking social support. She discusses how these immigrants struggle to maintain their own beliefs and experience while embracing new practices imposed by the missionaries offering aid. Raudaskoski (2009) uses MDA to examine identity construction as demonstrated by a phone conversation between an adoption agency and a couple, pertaining to a potential child placement. Multimodal transcripts provide perspective on this interaction. What on the surface seems to be a simple phone conversation is revealed through closer examination to be far more complex, as it documents the transformation of identity of two adults into expectant adoptive parents.

MDA can also be used to demonstrate the myriad ways individual mediated actions can effect change at the macro level of society. Al Zidjaly (2006) demonstrates one way in which the actions and practices of one social actor have the ability to impact the lives of others. Her study observes a disabled individual in Oman who works with caregivers acting on his behalf to change laws concerning the welfare of disabled citizens.

Jones conducted the first extended study utilizing MDA to investigate the AIDS/HIV issue in public discourse (Jones, 1999, 2007). His key findings identified a distinct disconnect between media presentations of the risks and effects of AIDS/HIV and the social actors' behaviors during sexual encounters, drug usage, or both. The study demonstrated that there was a misconception that "quality" people were immune to the AIDS/HIV virus, creating an impression of imaginary protection. Such misconceptions allowed people to dissociate

their behavior from the real risk of infection. The gap found in this study acknowledged that public health discourses are largely inapplicable when it comes to creating positive changes in behavior.

In another direction, Lou (2010), using MDA as well as visual analysis, looks into billboard advertisements and shop signs to study the ways in which ideology becomes part of an individual's narrative construction. She suggested that discourse analysts must move away from narrative text and consider the editorial perspective and resources used in the creation of the text. As part of an investigation into the transformation of Washington DC's Chinatown, Lou looked at both the visual composition and spatial context of billboard advertisements in that district. She concluded that the gaze of the subject used, and the size of the frame used in the billboard design, serve to represent an editorial perspective, and as such, engage in a direct conversation with the billboard viewers. Her investigation shows how gaze contained in a carefully chosen editorial image is able to deliver a message through visual analysis. Through the juxtaposition of billboard placement with selection and display of words and visuals, Chinatown's new image is demonstrated to the viewer.

Multimodal interactional analysis (MIA), developed by Norris (2004), provides further insights into mediated action. Norris (2004) demonstrates that often a social actor is engaged in various actions simultaneously. For example, if a person speaks and gestures, the utterances may make little sense if gestures are not also included in the interpretation (Norris, 2011). This method explores how different mediational means intersect and combine to communicate the entire message intended by the social actor. The actor may be focusing on few higher-level actions at the same time, but with differing levels of awareness and attention. Even though the social actor may be aware of and giving attention to his or her other higher-level actions, his or her primary focus may be on one specific interaction. Thus, the focus itself communicates the importance of the action.

MDA is, as yet, a relatively new theoretical approach. However, due to the flexibility MDA has to employ research techniques appropriate to the topic at hand, it has already demonstrated a wide range of applications in furthering the understanding of social actions. Researchers around the world are recognizing the potential of using MDA to explore meaning and representation in all its forms, from investigating the identity construction of individuals, to social practices surrounding health discourses, to analyses of the impact of a multinational corporation on the social discourse of a community. As MDA becomes more widely practiced, we may observe a significant shift in the understanding of social actions at all levels.

Meta-Analysis

JOHN M. NORRIS

Introduction to Meta-Analysis and Research Synthesis

Meta-analysis is a secondary research methodology consisting of techniques for reviewing quantitative primary research studies; extracting, combining, and comparing findings; and interpreting what is known about particular questions, variables, or other foci that have generated substantial empirical attention. First attributed to Glass (1976), though drawing on methods for combining data across studies that date back at least to Pearson (1904), meta-analysis is a specific application of research synthesis. Broadly speaking, research synthesis entails any of the variety of approaches to reviewing and making sense of accumulated knowledge within bodies of empirical literature that focus on specific scientific topics, referred to as research domains (Light & Pillemer, 1984). Research synthesis thus includes narrative reviews, statistical significance vote-counts, qualitative metasyntheses, and other methods for taking stock of research findings, and related efforts have been evident for many years within applied linguistics (e.g., Krashen, Long, & Scarcella, 1979).

Beginning in the 1970s, in response to critical weaknesses (reviewer bias, idiosyncratic study inclusion/exclusion, inaccurate interpretations of statistical significance), rigorous methods for review emerged in the form of systematic research synthesis (Light & Smith, 1971). In systematic syntheses, primary studies are treated as individual data points and the reviewing process itself as an investigation of the literature, in an attempt to present the most accurate and comprehensive, least biased, current understanding of a particular research domain. Methods include exhaustive search and retrieval of all available studies, criteria for including and excluding studies, reliable coding of studies for features of interest to the discipline, epistemologically valid approaches to discerning patterns of findings that have accumulated across studies, and the analysis and critique of study methodologies as well as methodological characteristics of studies that manage to get published in the domain (Norris & Ortega, 2006, 2007).

Although there is a reductionist tendency in many disciplines to equate all research synthesis with meta-analysis, it is important to understand that meta-analyses address only a very specific type of research—primary studies that *quantify* findings, generally in conjunction with experimental, quasi-experimental, or correlational designs—and the techniques that have been developed for meta-analysis are not intended to be used with epistemologically distinct domains (e.g., qualitative research, for which unique synthetic methods exist; see Suri & Clarke, 2009; in applied linguistics, see Téllez & Waxman, 2006). Meta-analysis, then, involves the statistical combination of findings from a group of independent studies that have investigated the same phenomena in quantitative terms. When applied judiciously to quantitative studies, ideally by domain experts, meta-analysis offers many advantages to research communities. In particular, it helps to rectify the widespread misunderstanding of, and dependence on, null hypothesis statistical significance testing, by shifting the focus of researchers away from probability estimation (*p*-values) and toward the actual effects or relationships that have been observed across studies in the form of effect sizes (Rosenthal, Rosnow, & Rubin, 2000). An effect size is a calculation of the magnitude of a finding, such as the amount of learning that accrues through a particular

instructional intervention, transformed onto a common scale so that findings from similar studies can be combined into an overall estimate of the actual effect. By investigating patterns of effect sizes across studies, meta-analysis also encourages researchers to reject the myth of the single, perfect study, and instead to reconceive of individual studies as contributing to the gradual accumulation of findings by replicating variables under diverse conditions (Norris & Ortega, 2006). Meta-analysis also provides techniques for investigating the influence of important factors on observed effect sizes, such as population characteristics or intervention type and duration, as well as unintended consequences of methodological features, such as the reliability of measures (Lipsey & Wilson, 2001). In the end, the primary contribution of meta-analysis lies in its capacity to uncover trustworthy, replicated answers to questions about what works, how much, and why, and, simultaneously, to lay bare the realities of how well research methodologies adopted by particular domains are able (or not able) to answer these questions.

Meta-analysis was first introduced in applied linguistics at the end of the 1990s, though almost exclusively in research on language instruction and second language acquisition (for examples in other applied linguistics disciplines, see: in language assessment, Ross, 1998; In'nami & Koizumi, 2009; in motivation research, Masgoret & Gardner, 2003). Since then, second language (L2) meta-analyses have experienced a dramatic increase in publication frequency (Norris & Ortega, 2010; Oswald & Plonsky, 2010). Accompanying technological developments, including easy-to-use meta-analytic software, have also made increasingly sophisticated analyses available to quantitative research synthesists, some of which have begun to appear in the L2 literature (e.g., Li, 2010). In the following, I sketch the basic steps and considerations associated with meta-analytic methods, and I refer to additional resources for technical details.

Problem Specification and Literature Search

Meta-analysis begins with the specification of a problem that has been researched substantially and for which reasonable answers are needed and likely available. Ideally, that means that only mature domains should be subjected to meta-analyses, where comprehensive theories frame debates, constructs are carefully operationalized and measures are consistently replicated, experimental or other designs adhere to rigorous validity standards, and conceptual and statistical study features are reported with fidelity (Slavin, 1986; Ellis, 2006). Of course, in young disciplines like applied linguistics, it may be unreasonable to assume that most research will live up to such expectations. Nevertheless, problems exist, research accumulates, and meta-analysis offers a means for making sense of where we have come from and where we need to be going. In practical terms, meta-analyses should embark purposefully from a thorough grounding in the substantive issues of a research domain, providing a clear characterization of the origin and theories associated with a particular problem, and justifying specific research questions that need to be answered (e.g., Norris & Ortega, 2000; Li, 2010). Where that is not possible, meta-analysis is premature.

The next step is the literature search, the objective of which is to produce an exhaustive and replicable identification of all primary studies conducted to date in relation to the specified problem. Literature searches are exhaustive in that they pursue all available means for locating research, including the use of key words in electronic bibliographic databases (see guidelines in In'nami & Koizumi, 2010), forward searches in Web-based citation indexes, and so on. Although Web-based resources are much more comprehensive than in the early days of meta-analysis, it is still advisable to include manual searches of publications, including edited books and journals, as well as extensive footnote chasing and bibliographic cross-checking. Searching the published literature may not be sufficient,

however, given a problematic editorial tendency to publish only those quantitative studies with statistically significant results (publication bias) and the probability that researchers have not submitted studies for publication that did not “achieve” statistical significance (the file-drawer problem; Rosenthal, 1979). As such, it is also recommended to search for and include important if unpublished studies, such as dissertations, and to tap into the so-called “fugitive” literature where possible, such as conference presentations (e.g., Taylor, Stevens, & Asher, 2006; Li, 2010). A key condition for reporting of meta-analyses is the full documentation of procedures by which the literature was searched, enabling the possibility of replication by future synthesists.

Study Eligibility Review and Coding

Naturally, the results of a comprehensive literature search will be the identification of many possibly relevant studies. The next step is to adjudicate which studies are eligible for review and which do not meet criteria stipulated by the meta-analyst (Norris & Ortega, 2006). A first pass at the studies addresses the “apples and oranges” problem by designating the specific topics, questions, designs, variables, or all of these to be investigated, and retaining only those studies that do so. A second pass excludes those studies that have not reported the data necessary for meta-analytic calculations, including in particular descriptive or other statistics, or both, for all relevant variables (though, as in Norris & Ortega, 2000, studies which do not report necessary data may nevertheless be included in synthetic reviews of the domain, if not in quantitative meta-analyses *per se*). A final pass may address the “garbage in, garbage out” problem by establishing study quality criteria (e.g., true randomized control trial designs, measurement reliability minimums) and excluding studies that do not meet the criteria. However, such *a priori* criteria for exclusion have a tendency to underestimate the complexities of actual research and to ignore the ecological realities of particular domains. In applied linguistics, as opposed to clinical drug studies for example, it simply may not make sense or be possible to operationalize idealized experimental designs. Study quality matters, to be sure, but it is best left to *post hoc* investigation in meta-analysis (Glass, McGaw, & Smith, 1981; in applied linguistics, see Plonsky, *in press*).

Once a body of eligible primary studies has been determined, a next key step involves the coding of features important to answering meta-analytic research questions. In study coding, each research report is treated like a study participant, and data are “elicited” from the reports through careful inspection, ideally by a team of meta-analysts. Categories to be coded may include substantive features (types of variables, population characteristics, etc.), methodological features (experimental design, sample sizes, etc.), and reporting features (publication venue, date, etc.). Coding itself typically ranges from the simple recording of necessary quantitative data to the assignment of ratings according to high-inference categories (e.g., type of intervention). Often, the categories to be coded include novel constructs not necessarily identified by primary researchers, yet having particular salience for answering larger-order meta-analytic questions. For example, Norris and Ortega (2000) coded L2 instructional intervention studies according to their own theoretically derived definitions of explicit versus implicit and focus-on-form versus focus-on-forms treatments. Given the range of features to be coded and the importance of reliability in the coding process, common practices include the use of a coding book that defines all features and corresponding data requirements, the socialization of coders and disagreement resolution, and the estimation of coding reliability overall and by categories (e.g., Li, 2010). The outcome of the coding process should be a reliable data set that represents the important features of the targeted domain, ready to be subjected to further analyses.

Calculating and Combining Effect Sizes

Perhaps the primary objective of meta-analysis is to estimate the average, overall, or “true” finding—and possible reasons for any observed variability—that has emerged across multiple studies within a given research domain. Rather than focusing on the probability that a finding is statistically reliable (the preoccupation of inferential significance testing), the focus here is on the amount, degree, or meaningfulness of what has been found, referred to as an effect size. Hence, meta-analysts synthesize the effects observed for independent variables on dependent variables, or the relationships between predictor and criterion variables, as these have been replicated across numerous primary studies. Sometimes, key variables are operationalized in nearly identical ways from one study to the next, and it is possible to combine and compare effects according to the original measures, referred to as unstandardized effect sizes. The benefit of unstandardized effect sizes is that they convey inherent meaning in terms that are immediately interpretable by a research community. A rare example of synthesizing unstandardized effect sizes in applied linguistics is Ortega’s (2003) review of 27 studies that measured L2 syntactic complexity using the three indices of mean length of t-unit, mean length of clause, and clauses per t-unit (i.e., direct measures of syntactic phenomena in L2 written or oral communication). Ortega found patterns of meaningful differences in these indices that were predictive of L2 proficiency levels, for example on the order of 2.0 words for mean length of t-unit. Clearly, a difference of two words in the average length of sentences written by language learners is a unit of analysis immediately interpretable by researchers and teachers alike.

Despite the utility of unstandardized effect sizes, in applied linguistics it is typically the case that researchers operationalize variables in unique ways from one study to the next; for example, researchers investigating L2 proficiency development may measure gains on the Test of English as a Foreign Language (TOEFL) in one study and on a locally devised written C test in another. A standardized effect size (i.e., one that transforms all data onto a single scale) is a calculation of the magnitude of difference, or strength of relationship, observed within any study regardless of how the variables have been measured (for calculation of various effect sizes, see Kirk, 1996). Pearson’s product-moment correlation coefficient, r , is a familiar effect size that provides a standardized index of the extent to which measures of two variables for the same population sample are mathematically associated, ranging from perfect disassociation (−1.0) to perfect association (+1.0). Less familiar, but more directly relevant for experimental and quasi-experimental research, is the family of effect sizes used to index the magnitude of difference observed between participant groups, intervention conditions, or other factors as measured on a single dependent variable. Effect sizes of this sort—all of which produce a *standardized mean difference*—include Glass’s Δ , Hedges’s g , and Cohen’s d . The index most commonly used in applied linguistics is Cohen’s d (Cohen, 1988), calculated as shown in equation (1), where the mean score of a control group is subtracted from the mean score of an experimental or treatment group and then divided by the pooled standard deviation of the two groups.

$$d = \frac{\text{mean}_e - \text{mean}_c}{S_w} \quad (1)$$

A basic assumption in this calculation is that the true variability in the population is best estimated by combining the standard deviations of the population samples investigated, hence the use of the pooled standard deviation as calculated in equation (2).

$$S_w = \frac{(n_1 - 1)S_1 + (n_2 - 1)S_2}{(n_1 - 1) + (n_2 - 1)} \quad (2)$$

The result of any standardized mean difference calculation is a representation of the size and direction (positive or negative) of the difference observed between two groups in standard deviation units; there is no mathematical limit to the range of possible effect sizes that might be found. Thus, an effect size of $d = +.50$ indicates that the treatment group outperformed the control group by one-half of a standard deviation on a dependent variable measure, and an effect size of $d = +2.00$ indicates a difference of two standard deviations in favor of the treatment group. An essential step in meta-analysis, then, is to derive an effect size from each study; these effect sizes can be compared with each other or combined into an average overall finding, because they are based on a common scale.

As discussed in Norris and Ortega (2000, 2006) and Oswald and Plonsky (2010), the derivation of effect sizes from most research reports in applied linguistics is complicated by several factors. First, depending on the designs adopted by primary researchers, it may be difficult to identify which groups to contrast for calculating the mean difference (or correlation); not all researchers operationalize true control or even comparison conditions in their studies, thus the meta-analyst must decide whether to calculate and include effect sizes based on direct comparisons of different treatments, or whether to separate out (and either investigate as a subset or exclude) studies that do not include control conditions. Second, most primary researchers report on multiple independent, moderating, and dependent variables, because of the complex nature of the domains under investigation. A challenge for the meta-analyst is to determine which groups or other variables to compare on which dependent variables in calculating an effect size, and then to determine how many of these should be included in the meta-analysis (i.e., should a single study contribute numerous effect sizes or just one?). Third, studies of the same phenomenon may adopt either between-subjects (treatment–control) or within-subjects (repeated-measures) designs, or combinations, leading to the challenge of comparing longitudinal changes with cross-sectional differences. It is preferable to separate these two designs in the calculation of effect sizes, not least because of the statistical tendency of within-subjects designs to produce larger mean differences (Lipsey & Wilson, 2001). Finally, the reporting of basic descriptive statistics (means, standard deviations, n -sizes of each group) has been less than consistent in applied linguistics publications, forcing meta-analysts to either track down researchers and their data, estimate effect sizes from other statistics, or exclude studies that do not report the necessary data.

Assuming these challenges can be resolved, a first synthetic pass is typically to average the effects that have been found within the domain, producing an overall mean effect. For example, Lyster and Saito (2010) found an average effect of $d = +.74$ for 15 classroom studies of L2 oral corrective feedback, suggesting an average difference of around three-fourths of a standard deviation in favor of feedback over oral interaction without correction. Similarly, subsets of effect sizes may be averaged according to important factors identified within the coding of studies, such as participant variables (age, proficiency, etc.), dependent variable measures (selected- versus constructed-response tests, etc.), intensity of treatment (hours, weeks, etc.), and so on.

Though combining effect sizes seems straightforward—and indeed, it should proceed on the basis of fundamental concepts and questions that have been identified during study coding—several challenges qualify the apparent ease of averaging effect sizes. A basic statistical assumption is that studies with larger sample sizes will be more likely to identify the “true” effect of a treatment or relationship among variables, whereas small-sample studies are subject to larger amounts of error and idiosyncratic influences of participants. Accordingly, where variability in sample sizes (or possibly other study qualities) exists, effect sizes can be weighted, such that larger-sample studies (or studies with greater homogeneity of findings, higher methodological quality, more reliable measures, etc.) carry greater influence in determining the overall observed effect (Hunter & Schmidt, 2004).

A related challenge has to do with the extent to which it is assumed that all studies are providing an estimate of a single “true” effect (e.g., the effect of a drug), or whether studies are assumed to be tapping into the actual heterogeneity of the phenomena under investigation (i.e., the effect itself varies systematically depending on contextual and other factors). In the former, fixed-effects model, effect sizes are weighted only by a function of sample size, with larger studies having more influence, and then combined into an average overall effect size. In the latter, random-effects model, in order to reflect the likelihood that there is a sampling of multiple “true” effects (highly likely in most L2 research), weighting is based on a combination of variance estimates associated with between-study heterogeneity and within-study sample sizes. In practical terms, the weighting of individual study effect sizes tends to be more balanced in the random-effects model, with less difference between large-sample and small-sample studies. Note that although the weighting of studies increases the mathematical complexity of meta-analysis, it is also the case that contemporary meta-analytic software facilitates considerably the inclusion of these and other techniques (e.g., Borenstein, Hedges, Higgins, & Rothstein, 2005; see also Oswald & Plonsky, 2010, for discussion of reasonable approaches to heterogeneity testing and meta-analytic models in applied linguistics).

Confidence Intervals and Effect Size Comparisons

A confidence interval (CI) represents the margin of error associated with the average value that emerges from any set of repeated observations. In meta-analysis, the calculation of CIs provides a critical frame of reference, both for interpreting the consistency of average effect sizes and for making comparisons among effect sizes associated with different independent, dependent, or moderating variables, or for individual studies. In more precise terms, a meta-analytic CI estimates the range of possible effect sizes within which an observed effect size can be trusted to occur at a specified probability level; this range is calculated from four sources of information: an effect size, the number of studies (or number of participants for a single study) that have contributed to this average, the variability in effect sizes observed across the studies (or across participants within a study), and a probability level (commonly 95% or 99%) associated with a hypothetical distribution (e.g., t , z). Equation (3) shows one formula (among many possible) for calculating a 95% CI for Cohen’s d effect size, where k is the number of studies, sd is the standard deviation associated with the average effect size, and $95\%t$ is the value of the t distribution associated with the stipulated degrees of freedom ($k - 1$).

$$CI = d \pm \left[(95\%t, k - 1df) \left(\frac{sd}{\sqrt{k}} \right) \right] \quad (3)$$

While variations exist for calculating CIs according to distinct inferential assumptions (Cumming & Finch, 2001), conceptual treatment of any CI is essentially the same. The CI is reported in terms of a lower and upper boundary, or confidence limits, displayed in whatever unit of analysis is being used for the calculation of the effect size. Thus, in Norris and Ortega (2000), the overall average effect size for studies on the effectiveness of L2 instruction was found to be $d = +.96$, with a lower 95% CI of $+.78$ and an upper 95% CI of $+1.14$. That is, the average effect size, and by extension the estimated “true” effect associated with this domain of research, could be trusted to fall somewhere between these limits.

CIs also facilitate the comparison among subsets of effect sizes associated with important factors as well as the contribution of individual studies to the overall meta-analysis. In terms of individual studies, effect sizes and CIs can be calculated and compared for each

Figure 1 Example of a graphic display of average effect sizes and confidence intervals (Norris & Ortega, 2000 © Wiley-Blackwell)

study, and these data are increasingly displayed in the form of a forest plot of all studies in the meta-analysis, along with depiction of any weighting attributed to each (see example in Oswald & Plonsky, 2010). Where salient factors have been identified in subsets of studies, average effect sizes and CIs can be calculated and used to draw comparisons (similar, though not identical, to a statistical significance test) about the influence a given factor may have had on the observed effect. For example, Norris and Ortega (2000) drew comparisons among study effect sizes grouped and averaged by overarching instructional intervention types, as shown in Figure 1. The vertical boxes around the effect sizes show the lower and upper confidence limits for each group of studies; where the boxes overlap substantially between groups, the difference between effect sizes cannot be trusted at the 95% probability level (e.g., between FonF and FonFS), and where the boxes do not overlap, the difference generally can be trusted (e.g., between All explicit and All implicit). Again, this kind of graphical comparison is not the same as a mean-differences statistical significance test; rather it provides a useful rule of thumb for quickly understanding the apparent differences that have been found in association with different kinds of salient factors.

Interpreting Meta-Analytic Findings

Relative comparisons among effect sizes and CIs that are associated with conceptually important groupings of studies provide one basis for interpreting meta-analytic findings. In terms of interpreting effect sizes themselves, many meta-analysts have adopted rules of thumb that were proposed very tentatively by Cohen (1988). Thus, for Cohen's *d*, effect sizes between .20 and .50 are considered small, .50 and .80 medium, and above .80 large; similarly, for correlations, an *r* of .10 to .30 is small, .30 to .50 medium, and above .50 large. However, in Cohen's original recommendation, he suggested "The terms 'small,' 'medium,' and 'large' are relative, not only to each other, but to the area of behavioral science or even

more particularly to the specific content and research method being employed in any given investigation" (1988, p. 25). Within applied linguistics, more useful will be the determination of what range of effect sizes translates into what kinds of meaningful differences/relationships in real-world terms, as in the unstandardized effect sizes reported in Ortega (2003), as well as the relative comparison of effect sizes across meta-analyses. Another important frame of reference for interpreting findings is the thorough synthesis of methodological strengths and weaknesses of a domain, offering both important constraints on overinterpretation and advice on areas in need of future investigation and methodological improvement (e.g., Norris & Ortega, 2000).

More generally, as the application of meta-analysis to applied linguistics matures, it will become increasingly important for synthesists to avoid a predilection toward subjecting any and all possible research to "cookie-cutter" meta-analyses (Grant & Grauer, 1999) and "high-tech statistication" (Rosenthal & DiMatteo, 2001). As with any other statistical technique, meta-analysis produces a set of numbers. What those numbers mean, how they can be interpreted, and to what extent they help shed light on important concerns depends on the care with which a meta-analysis has been grounded in the conceptual and methodological foundations of a specific domain of research. In the various branches of applied linguistics, research communities must develop meta-analytic or other synthetic methods that respect the kinds of research we are synthesizing, that help clarify the stories we are trying to tell through research, and that help push our disciplines toward improved practices. Uncritical adoption of meta-analytic practices and principles from other disciplines will not make that happen, but adoption of a mindful synthetic ethos may (Norris & Ortega, 2006).

Metadiscourse

ANNELIE ÄDEL

Background to Metadiscourse

Language enables people to refer to themselves and to their interlocutors explicitly, not only as experiencers in the world (as in examples 1–2 below), but also as communicators (examples 3–4). In addition, they may use language to comment not only on the topic under discussion (examples 5–6), but also on the very situation of communicating (examples 7–8).

- | | |
|--|---|
| (1) <i>I'm feeling tired</i> | (3) <i>Let me give you an example</i> |
| (2) <i>You look great</i> | (4) <i>What you're saying is not making sense</i> |
| (5) <i>Twelve degrees is surprisingly cold for May</i> | (7) <i>We will return to this issue in Chapter 6</i> |
| (6) <i>Condors probably never were numerous in North America</i> | (8) <i>I can't hear you you'll have to speak up I can't hear a word</i> |

The examples in the right-hand column illustrate how we can use language to talk about language itself, which is often called *reflexivity in language*, or the *metalinguistic function*. The term *metalinguage* was popularized by the linguist Roman Jakobson, who contrasted it to *object language*, which is used when we talk about anything that is external to language. Although speakers typically draw on object language to a greater extent than metalinguage, Jakobson (e.g., 1998) posited that the metalinguistic function is one of six basic functions of language, and that it is quite pervasive not only in specialized discourse (e.g., among dictionary makers or grammarians) but also in everyday conversation—to which the examples in the right-hand column above testify.

Metadiscourse can be described as a specific type of reflexivity in language. It is often summarily defined as “discourse about discourse,” which means that, in speaking or writing, we show an awareness of the discourse *as* discourse. We do so by adding commentary to the ongoing discourse, such as any or all of the following: pointers as to how the discourse is organized, markers indicating what the main message to be communicated is, statements on the (in)appropriateness of a specific wording, or signals that indicate how we wish the audience to respond to the content. In fact, metadiscourse is crucial for achieving successful communication, as it involves resources for discussing meaning, asking for clarification, checking for understanding, and much more. It also plays an important role in guiding the audience through the discourse and in creating a speaker (or writer) persona.

As a rhetorical strategy, metadiscourse can be characterized as helpful and generally displaying a writer/speaker who is in control. However, abundant metadiscourse can also be interpreted as “didactic, interfering, and patronising” (Mauranen, 1993, p. 189). The effective use of metadiscourse in writing is an important teaching application for metadiscourse. However, what is considered effective has been shown to potentially vary across different language cultures. This is an issue of growing importance as the use of English as the lingua franca of academia increases. Scholars from around the world who must learn to write in English, especially those whose first language has conventions that

differ from those of Anglo-American academic discourse, may find their communicative competence to be seriously affected by an insufficient understanding of the expected practices.

The idea that there can be an ideal level of metadiscourse in communication goes back at least as far as the original publication of the popular US style guide by Williams (1981/1989), where metadiscourse was given considerable coverage. It was not until after the use of metadiscourse had become incorporated by style guides that it became an active area of research in applied linguistics, even though the term “metadiscourse” was first coined in the 1950s by the linguist Zellig Harris. Since the early 1990s, it has grown to be an active but divided area in applied linguistics, with two main strands subscribing to quite different definitions. This division runs so deeply that one of the strands (the “interactive” strand) would consider as metadiscourse not only the examples in the right-hand column above, but also the ones in the left-hand column.

The two traditions are summarized in the next section. This is followed by a section on methods and materials typically used in studies of metadiscourse. The final section brings up some of the variables that have been found to affect the use of metadiscourse.

Divided Perspectives on Metadiscourse

A fundamental issue in metadiscourse studies is how to define and delimit the concept; see for example, Mauranen (1993, pp. 145–55) and Ädel (2006, pp. 167–79) for further details. The two different approaches that have emerged will be referred to as the *interactive* approach and the *reflexive* approach (based on Ädel, 2010), to avoid the previously used terms *integrative* and *non-integrative* (Mauranen, 1993), where one of the strands is defined in negative terms.

In the interactive approach, a broad definition of metadiscourse is applied, for example including stance markers (which express the writer’s attitude to a statement), connectives (which explicitly link, or mark the relation between, sentences or paragraphs), and references not only to the ongoing discourse but also to other discourses (as when another text is quoted). There is a strong emphasis on written discourse; the starting-point is taken to be the interaction between the writer and reader. In this tradition, metadiscourse is broadly conceived of as any linguistic material at all that can be said to guide and direct the reader through the text (cf. Crismore, 1989).

Research into metadiscourse in applied linguistics began with the interactive approach, which was presented by Vande Kopple (1985). It was triggered by the perceived neglect, in studies of text, of anything that was not propositional, or related to the content itself, and by a wish to prove false the notion of academic writing as consisting exclusively of impersonal and factual statements. As a reaction against the strong emphasis on the development of content in text, researchers into metadiscourse focused instead on those linguistic features that could be considered non-content oriented, lumping these together into one category under the label of metadiscourse. This category thus included features as diverse as stance markers (*unfortunately; I agree; surprisingly*), expressions of certainty (*definitely; it is clear that*) and doubt (*might; perhaps; possible*), connectives (*but; thus; and*), the use of “I” marking the presence of the writer, engagement markers (*consider; note that; dear reader*), references to other texts (*according to NAME; (NAME, 1990)*), as well as clearly reflexive features such as illocution markers (*to conclude; briefly stated*), code glosses (*namely; in other words*), sequencers (*firstly; secondly*), announcers (*as we shall see in Chapter 5*), and reminders (*as noted above*).

These features correspond more or less to those originally outlined in Vande Kopple (1985). His classification has been widely used in the interactive approach, although it has

been modified by Crismore, Markkanen, & Steffensen (1993) and Hyland (e.g., 1998, 2005). Naturally, most of these features have been studied extensively, not as part of metadiscourse, but as categories in their own right. For example, there is a large body of research, at least for the English language, on expressions of stance and expressions of (un)certainty (under labels such as *modality*, *evaluation*, and *hedging*), on sentence connectives, and on intertextual references (also known as *attribution* or *citation* practices).

Early work in the interactive strand vaguely applied Hallidayan concepts (starting with Vande Kopple, 1985), dividing metadiscourse into two main types: *textual* and *interpersonal*. The textual type refers to linguistic elements that show how the discourse is organized and how different parts are related to each other, while the interpersonal type refers to linguistic elements that display the writer's attitude to what is said in the discourse. If metadiscourse is described as either textual or interpersonal, it is by definition not ideational (or *propositional*, which is the third and final concept in Halliday's model). This division is in line with defining metadiscourse as non-propositional material, which most researchers into metadiscourse do. However, for arguments against viewing metadiscourse simply as non-propositional material, see for example, Mao (1993) and Ädel (2006, pp. 209–12).

The interactive approach has been challenged by the reflexive approach. In this approach, the point of departure is reflexivity in language, or the self-reflective use of discourse, in which speakers or writers show an awareness of discourse *as* discourse. Various criteria for metadiscourse have been suggested (Ädel, 2006, pp. 27ff), but are not followed in all studies adopting the reflexive approach. The *explicitness* criterion refers to the fact that it is the explicit (and intended) commentary on the discourse or language use that is of interest. The *world of discourse* criterion states that the action should take place in the world of discourse rather than in the "real world." The *current text* criterion refers to the fact that metadiscourse makes reference to the ongoing text rather than to other texts; references to other texts fall instead under the category of *intertextuality*. The same principle applies to the current addresser and the current addressee, with the added requirement that they be talked about or referred to in their roles as discourse participants—that is, in the world of discourse.

These criteria have been integrated into a reflexive model of metadiscourse (Ädel, 2006) based on three of Jakobson's six functions of language: the *metalinguistic* (focusing on the discourse or language), the *expressive* (focusing on the writer/speaker), and the *directive* (focusing on the audience). This is seen as a better fit to a functional model of metadiscourse than the Hallidayan concepts.

The first applied linguistics study to take a reflexive approach to metadiscourse was Mauranen (1993), although several studies of similar phenomena had been carried out in general linguistics under various labels (e.g., Schiffrin, 1980 on *metatalk*). Mauranen and others adopting the reflexive approach originally used the terms *text reflexivity* and *metatext* rather than metadiscourse. There has been some debate about the appropriateness of the term metadiscourse (cf. Sinclair, 2005), mainly involving the objection that there is no true "meta" level in language (for counterarguments, see Ädel, 2006, pp. 213–14).

Methodology in Studies of Metadiscourse

Research into metadiscourse represents an area which is predominantly empirical and based on naturally occurring discourse. However, some experimental work has also been carried out, to investigate the actual effect metadiscourse has on an audience. Furthermore, some have taken an ethnographic approach to the study of metadiscourse, involving interviews with practitioners about how (they think) they use metadiscourse and how they perceive various aspects of metadiscourse (see e.g., Hyland, 2005).

The empirical analysis of metadiscourse was originally carried out using fully manual methods, but with the development and spread of databases of language data (corpora) and corpus-assisted methods, researchers have increasingly tried to apply (semi-)automatic methods to metadiscourse studies—see Hyland (2005) and Ädel (2006) for large-scale, systematic examples. As metadiscourse is a fuzzy category which is highly context-dependent, manual checking of automatically retrieved examples is typically necessary.

Experimental work on metadiscourse has primarily been concerned with the comprehension and recall of a spoken or written text under two different conditions: with and without metadiscourse. Researchers have investigated the role of metadiscourse in both reading comprehension (e.g., Vande Kopple, 1988) and listening comprehension (e.g., Chaudron & Richards, 1986), although to date there has been inconclusive support for any positive effect of metadiscourse. While researchers agree that metadiscourse is rhetorically important and a persuasive tool, not enough experimental research has been done to determine what systematic rhetorical effects the presence or absence of metadiscourse actually has on an audience. One example of a small study is Mauranen (1993, p. 188), which found that texts were perceived not only as more logical but also as more authoritative with metadiscourse than without.

In both corpus-based and experimental research, the type of material analyzed in studies of metadiscourse has overwhelmingly been *academic* discourse. One reason for this is that metadiscourse is common in academic genres, where the writer/speaker is typically expected to guide the audience through the discourse, for example by making its structure explicit, as in “In this paper, I explore . . .” (from a written essay) or “Just to give you kind of a map of where we are going . . .” (from a lecture). Another reason is that persuasive and interactive features in supposedly “objective” (information-oriented and expository) discourse have, in the past two decades, generally attracted the attention of researchers in applied linguistics, and thus the attention of researchers with a special interest in metadiscourse.

Variables Affecting the Use of Metadiscourse

Metadiscourse has been shown to be a common feature of academic discourse (and is presumed to be common in other types of discourse as well), although how common it is depends on which definition is applied. Metadiscourse has also been shown to display considerable variation in use. However, in order to fully establish the extent of this variation, the variables that give rise to it, and the ranking of these variables, more research is needed.

One variable that has sparked considerable interest is crosslinguistic differences. The degree to which writers and speakers direct attention to the discourse itself or project their own attitude toward the discourse (expressing, for example, (un)certainly or (un)importance), has been shown to be governed to some extent by language culture. Investigating metadiscourse in research articles by Anglo-American and Finnish academics, Mauranen (1993) found that the Anglo-American writers clearly employed more metadiscourse than the Finnish writers. For example, they showed more interest in helping readers to interpret the text and made their presence felt more explicitly than the Finnish writers did. The Anglo-American writers displayed a more reader-oriented style and used more explicit rhetorical conventions, while the Finnish writers tended to be more writer-oriented and more implicit in their writing. Both strategies can be seen as persuasive in the appropriate cultural context, but either strategy, if directed to a target audience whose stylistic preferences are different, may prove to be rhetorically inefficient.

Several studies of metadiscourse have been undertaken in intercultural rhetoric, in which the basic assumption is that there are culture-specific patterns of writing, and that first-

language patterns may cause interference when writing in a second or foreign language. Crismore et al. (1993) investigated variation in the use of metadiscourse due to cultural differences in essays in English by university students in Finland and the United States. Both populations made use of all subtypes of metadiscourse, but differences were found in frequency distribution. For example, an overall greater density of metadiscourse was used by the Finnish group. Interestingly, these results are contrary to those of Mauranen (1993) mentioned above, which also compared Finns and Anglo-Americans. This suggests one or other, or both, of the following: (a) that it may make a significant difference whether the interactive approach (in Crismore et al.'s case) or the reflexive approach (in Mauranen's case) is used, and (b) that considerably more research is needed before we can really identify all the variables that influence the use of metadiscourse.

Research into academic discourse has grown increasingly attuned to the influence of academic discipline. Academics in different fields engage in different practices and construct knowledge differently, and thus also use discourse for somewhat different purposes. In studies of metadiscourse, considerable variation has been found across disciplines (e.g., Dahl, 2004; Hyland, 2005). Hyland (1998, p. 5) goes as far as to say that "All academic disciplines have conventions of rhetorical personality which influence the ways writers intrude into their texts to organise their arguments and represent themselves, their readers and their attitudes. This is largely accomplished through . . . metadiscourse."

Another variable that has received attention in research into academic discourse is genre. A range of different genres have been investigated from the perspective of metadiscourse; those which have received the most coverage are research articles (e.g., Mauranen, 1993; Hyland, 1998; 2005), textbooks (e.g., Hyland, 2005), and student essays (e.g., Crismore et al., 1993; Ädel, 2006). However, few studies explicitly compare the use of metadiscourse across genres (but see Crismore & Farnsworth, 1990; Bondi, 2001; Hyland, 2005). The use of metadiscourse has also been found to vary with the academic proficiency of the writer, for example in comparisons of university students and professional academics. Of course, proficiency level is related to genre in that groups at different proficiency levels also tend to target different audiences, thereby producing different genres.

We have seen that by far the great majority of metadiscourse studies to date have been concerned with *written* (academic) discourse. This is primarily due to the fact that written material is considerably easier to obtain than spoken material, though there is certainly also a great need for precision and explicitness in written discourse, which means that high levels of metadiscourse are likely. It is only in recent years that studies on spoken material have emerged, based predominantly on lectures and conference talks. There have also been a small number of studies explicitly comparing spoken and written metadiscourse (e.g., Mauranen, 2001; Ädel, 2010), thus taking the variable of mode into account.

As the study of metadiscourse has developed, research has grown increasingly variationist. For example, some studies have suggested that metadiscourse use varies according to position in the text; specifically, it tends to occur particularly often in part-genres such as introductions and conclusions (see e.g., Ädel, 2006, pp. 125–39). It has also been suggested that metadiscourse varies according to the gender of the writer, although the evidence is scant and inconclusive (e.g., Crismore et al., 1993). Other studies have taken a diachronic perspective on metadiscourse, investigating its potential change over time (e.g., Taavitsainen, 2000).

Expanding Perspectives

The focus here, reflecting the current bias in research, has been on English, and especially on academic discourse in English. Studies of metadiscourse involving other languages,

such as Spanish, do exist, however (see e.g., Pérez-Llantada, 2010). Also, studies in the tradition of intercultural rhetoric have, indirectly, considered a range of different first languages. There have also been some studies examining metadiscourse in non-academic genres such as spoken conversation, newspaper discourse, and parliamentary debates. This brief overview cannot do justice to the large number of studies on metadiscourse carried out over the past few decades; the small selection presented here certainly represents only a preview of the wealth of findings, past and future, in this rich area of study.

Methodological Foundations of Sociocultural Theory

HOLBROOK MAHN

Over the last three and a half decades sociocultural approaches have broadened the scope of and made significant contributions to second language acquisition (SLA) research. These approaches trace their theoretical and methodological origins to the Russian psychologist Lev Vygotsky (1896–1934), whose objective was to develop a method of analyzing human consciousness. This entry discusses Vygotsky's contributions to the methodological foundations of sociocultural theory.

Working with a team of researchers that he headed, Vygotsky developed an approach to studying consciousness that was shaped by and helped shape his theoretical framework—an approach that was refined through practice. This effort came to an abrupt halt in the mid-1930s with Vygotsky's death in 1934 and the banning of his work by the Soviet bureaucracy in 1936. His work was “rehabilitated” in 1956, and with the publication of *Mind in Society* in 1978 and the six-volume *Collected Works* from 1987 to 1999, the influence of Vygotsky's work has grown in a number of fields including SLA research, as reflected in entries throughout this encyclopedia. There are, however, widely varied interpretations of Vygotsky's work that lead to significant theoretical and methodological divergences, which in turn have led to different influences on sociocultural approaches to research.

A number of issues have contributed to these differences, including: (a) the fact that Vygotsky's methodology is based on Marx and Engels's—a methodology that has also been open to widely different interpretations; (b) the varying perspectives that different disciplines bring to his work; (c) translation issues, especially of key terms and concepts into English that do not capture the essence of Vygotsky's description of the concept in Russian; and (d) the fact that a significant number of his writings became available in English only in the 1990s. Additionally, the most widely read version in English of Vygotsky's major work (Vygotsky, 1986) is a condensed version that neglects essential elements in the original, including his reliance on Marx and Engels. Because of these issues, I rely on Vygotsky's writings to revisit the methodological approach he developed in collaboration with his colleagues in the Soviet Union from 1924 to 1934, an approach that SLA sociocultural researchers use as a foundation for their work.

Vygotsky's Methodological Approach

Vygotsky (1997a, 1997b) uses the term *methodology* on three interconnected levels, which are described in more detail below: (a) to refer to an overarching, philosophical, methodological approach based on Marx and Engels's *dialectical materialist* approach; (b) to describe the development of an *intermediary theory* that would shape and be shaped by research on a particular object of study (for Vygotsky the object is the human psyche—the entity created through the unification of the mind and the brain); and (c) to designate *specific methods or techniques* in his experimental studies, such as the method of double stimulation. While Vygotsky's ultimate goal is to explain the origins and the development of human

consciousness, the main focus of his research in this pursuit is the study of the relationships among thinking processes and language processes. The study of these relationships is fundamental to research on first and second language acquisition. In the preface to *Thinking and Speech*, Vygotsky (1987) provides an overview of the way in which he and his colleagues examine the complexity of the entity that is created through the unification of thinking and language processes and offers "the hope that our studies constitute a unified whole," stating that "all our work has focused on a single basic problem, on the genetic analysis of the relationship between thought and word" (p. 40), with *word* here denoting *language in general*.

Unlike contemporary researchers, Vygotsky views the relationship of thought and word as a unity. "Attempts to resolve the problem of thinking and speech have always oscillated between two extreme poles, between an *identification* or complete *fusion of thought and word* and an equally metaphysical, absolute, and complete *separation* of the two, a *severing* of their relationship" (1987, p. 44). In the first approach, because thinking and speaking coincide, there can be no examination of the relationship between the two: "One cannot study the relationship of a thing to itself" (p. 44). In the second approach, thinking and speaking are analyzed as separate entities that have only an external relationship, and then in trying to unite them "an attempt is made to reconstruct a connection between the two, to reconstruct an external, mechanical interaction between two different processes" (p. 44). Vygotsky (1987, 1997a, 1997b) argues that a new methodological approach is needed to study human consciousness in general and the unification of thinking and language processes in particular.

In *The History of the Development of Higher Mental Functions*, Vygotsky (1997b) writes that "the method must be adequate to the subject studied" (p. 27) and that "knowing the uniqueness [of the subject] and deliberately beginning the research from this point is the first condition for adequacy of the method and the problem; for this reason, the problem of method is the beginning and foundation, the alpha and omega of the whole history of the cultural development of the child" (p. 27). The object of Vygotsky's study is the *unification* of thinking and language processes and its relationship to the cultural development of the child, a development that entailed "first, the processes of mastering external materials of cultural development and thinking: language, writing, arithmetic, drawing; second the processes of development of special higher mental functions . . . [such as] voluntary attention, logical memory, formation of concepts, etc." (p. 14)—in other words the higher psychical processes that make humans human. In his investigation of these higher processes, Vygotsky focused on the development of the *internal system of meaning* that is created by the unification of the thinking and speaking processes. The method that Vygotsky developed to study this unification "is simultaneously a prerequisite and product, a tool and a result of the research" (p. 27).

The interrelationships between thinking and speaking processes and other mental processes constitute a system, whose nature changes with transformations in the relationships between the processes. Therefore, Vygotsky investigates the human psyche as an integrated system of interrelated mental/psychical, natural, and historical processes, constituted by the unification of the brain and the mind that occurs in interaction with the sociocultural, historical, socioeconomic, and ecological systems in which they are situated and to which they are interconnected. In contrast, other psychologists of Vygotsky's time analyzed mental functions such as perception, attention, and memory by isolating them from each other.

In developing the first level of his approach, its overarching, philosophical aspect, Vygotsky relies on the dialectical approach Marx and Engels created to study phenomena in their process of development, in their interconnectedness, in their essence. Dialectics, the "science of interconnections" (Engels, 1963, p. 14), examines systems in their development and in their relationships.

Dialectics is the logic of movement, of evolution, of change. Reality is too full of contradictions, too elusive, too manifold, too mutable to be snared in any single form or formula or set of formulas. Each particular phase of reality has its own laws and its own peculiar categories and constellation of categories which are interwoven with those it shares with other phases of reality. These laws and categories have to be discovered by direct investigation of the concrete whole; they cannot be excogitated by mind alone before the material reality is analyzed. (Novack, 1969, p. 66)

When analyzing the material reality of the human psyche in its social situations of development, Vygotsky often referred to a statement of Marx's from the third volume of *Das Kapital* to explain his approach to scientific inquiry: "If the essence of things and the form of their appearance directly coincided, says Marx [1981, p. 825], all science would be superfluous" (Vygotsky, 1997a, p. 325). To discover the "essence of things" an examination of origins and processes of development is needed, that is, studying it historically.

Historical study simply means applying categories of development to the study of phenomena. To study something historically means to study it in motion. Precisely this is the basic requirement of the dialectical method. To encompass in research the process of development of some thing in all its phases and changes—from the moment of its appearance to its death—means to reveal its nature, to know its essence, for only in movement does the body exhibit what it is. (1997b, pp. 42–3)

The challenge in examining processes from their origins and in their development, known as *genetic analysis*, is "using experimentally elicited and artificially organized processes of behavior to penetrate into how the real, natural process of development occurs" (1997b, p. 94).

The overall dialectical approach of Marx and Engels cannot be applied directly to the matter being studied; an intermediary theory—the second level—has to be developed. "In order to create such intermediate theories—methodologies, general sciences—we must reveal the *essence* of the given area of phenomena, the laws of their change, their qualitative and quantitative characteristics, their causality, we must create categories and concepts appropriate to it" (Vygotsky, 1997a, p. 330). Marx and Engels used this same approach to analyze the essence of human social formations by developing an intermediary theory, *historical materialism*, and creating categories and concepts appropriate to the study of the laws of motion behind human social formations (Marx & Engels, 1976). Vygotsky adopts this approach in his effort to develop an intermediary theory, *psychological materialism*, appropriate for analyzing the human psyche as a system of interrelated processes. He focuses on its origins, path of development, structure, and function and investigates the systemic interdependence, interconnection, and unification of psychological processes, as exemplified specifically in the unification of thinking and language processes.

In developing his analytic approach to study the relationship between thinking and language processes, Vygotsky first critiques the way in which prevailing psychological theories address this relationship, particularly the theories of Piaget and Stern—theories that ignore internal systems developed through social interaction, and focus instead on external language isolated from its communicative function, which results in "the relationships between thought and word [being] understood as constant, eternal relationships between things, not as internal, dynamic, and mobile relationships between processes" (1987, p. 283). Vygotsky also criticizes approaches that do not address social, cultural, and historical contexts, and in which "The child and the development of his higher mental functions are considered *in abstracto*—outside the social environment, outside the cultural environment and the forms of logical thinking, world view, methodological approach, and concepts on causality that govern these functions" (1997b, p. 9).

4 METHODOLOGICAL FOUNDATIONS OF SOCIOCULTURAL THEORY

The unification of thinking and language processes plays an essential role in the development of the *system of consciousness* and of the *system of meaning* for both the human species and the individual. The internal system of meaning created by the unification of thinking and language processes develops because of vital interactions between social, cultural, historical, and natural forces. The interconnections among these forces influence both the development of humanity and the individual person, particularly in the ability to communicate through language. In his analysis of *verbal thinking*, Vygotsky describes the structure or system that is created by the use of language to mediate meaning.

A central and basic aspect of [mental functions'] structure is the use of the sign as a means of directing and mastering mental processes. In the problem of interest to us, the problem of concept formation, this sign is the word. The word functions as the means for the formation of the concept. Later it becomes its symbol. Only the investigation of the functional use of the word and its development from one age to the next . . . provides the key to the formation of concepts. (1987, p. 126)

To study the functional use and development of language, Vygotsky (1987) uses *analysis into units* to investigate verbal thinking, maintaining it can access the relationships and interconnections between mental processes that traditional approaches used by psychology cannot. In contrast to a "psychology that decomposes verbal thinking into its elements in an attempt to explain its characteristics [and that] will search in vain for the unity that is characteristic of the whole" (p. 45), Vygotsky partitions the whole into a unit. "The term 'unit' designates a product of analysis that possesses *all the basic characteristics of the whole*. The unit is a vital and irreducible part of the whole" (p. 46) that is derived through an analysis that examines the "concrete aspects and characteristics" (p. 244) of the whole. Vygotsky derives the unit *znachenie slova* (meaning "through language use") to investigate verbal thinking. (See Mahn (2008) for a more in-depth description of Vygotsky's analysis of *znachenie slova* and the system of meaning.)

The concept of *unit of analysis* is often used by sociocultural researchers and others without identifying the unity from which their unit is derived or describing the process through which they have derived the unit. There is a tendency to use the unit as a lens through which to view the object of study rather than for the unit itself to serve as the object of investigation, as it does for Vygotsky. The object of study, for which Vygotsky derives the unit, is often misconstrued. He explicitly states that the unit *znachenie slova* is derived to gain an understanding of something very specific, namely *verbal thinking*, the entity created by the unification of thinking and language/speaking processes. However, this central point is obscured when scholars claim that Vygotsky derived this unit to study consciousness as a whole or the mind as a whole (Davydov & Radzikhovskii, 1985, p. 56; Wertsch, 1985, p. 192, 196; Zinchenko, 1985, p. 100; Yaroshevsky, 1989, p. 297; Lantolf & Appel, 1994, p. 22; Leontiev, 1997, p. 24). It is true that Vygotsky uses analysis of verbal thinking as a beginning step in his analysis of human consciousness, but the purpose of the unit *znachenie slova* is to analyze verbal thinking and not consciousness as a whole. The analysis of the unit will not reveal the nature of verbal thinking as a whole, but only that of its fundamental, primary aspects (Vygotsky, 1987, p. 244).

The misrepresentation of this essential aspect of Vygotsky's work pivots attention away from *znachenie slova* and leads to researchers purporting to follow Vygotsky developing alternative units and theories. Such was the case with Leontiev (1981), who was a member of a group of psychologists led by Vygotsky, but who distanced himself from Vygotsky's work and developed a theoretical approach that was more amenable to Stalin's Soviet bureaucracy, which at the time was engaged in a concerted attack on Vygotsky's ideas (Mahn, 2010). Arguments from these attacks are often echoed in contemporary interpretations of Vygotsky's work as well as in those which claim to "go beyond Vygotsky's theory"

but which do not accurately describe the central focus of his work—an analysis of the unit *znachenie slova*.

The third level of Vygotsky's methodology, practical experimental application, is used to analyze *znachenie slova*.

Experimentation is the only path by which we can delve into the patterns of higher processes in sufficient depth; specifically in an experiment, we can elicit in a single artificially created process the most complex changes separated in time, frequently with years passing latently, which are never accessible to observation in all their real totality in the natural genesis of the child and cannot be comprehended directly in a single glance and correlated with each other. (Vygotsky, 1999, p. 45)

Vygotsky and his colleagues look at mental functions and processes in relationship to the thinking/language unity. Luria said that Vygotsky cautioned that these experiments "should never be limited to sophisticated and laboratory models divorced from the real world. The central problems of human existence as it is experienced in school, at work, or in the clinic all served as the contexts within which Vygotsky struggled to formulate a new kind of psychology" (Cole, Levitan, & Luria, 2006, p. 53).

These empirical studies, as described in *Thinking and Speech*, fall into two broad categories: ones that study the development of *znachenie slova*—meaning through language—and ones that study "the nature and development of scientific and spontaneous concepts in ontogenesis" (Vygotsky, 1987, p. 40). The former investigate the process of the creation of meaning, of the development of concepts, by using meaningless words and connecting them to concepts created by the researcher. Vygotsky also studies the process of concept formation as "causally and dynamically determined" (1987, p. 127) by using an approach he calls the "functional method of dual stimulation." "In using this method, we study the development and activity of the higher mental functions with the aid of two sets of stimuli. . . . One set of stimuli fulfills the function of the object on which the subject's activity is directed. The second functions as signs that facilitate the organization of this activity" (p. 127).

The second group of studies entails a "comparative study of the development of scientific and everyday concepts in school-age children" (p. 167). Vygotsky uses the word *scientific* to designate concepts that are part of systems, such as numerical and alphabetic systems, not solely those concepts derived from the scientific method. Vygotsky's colleague Shozefina Shif primarily conducted this research using a new experimental method.

Subjects were presented with problems that were structurally isomorphic, but which differed in that they incorporated materials based on either scientific or everyday concepts. Using a series of pictures, the experimenter told a story that ended with a sentence fragment broken off at the word "because" or "although." This procedure was supplemented by clinical discussion in order to establish levels of conscious reflection on cause-effect relationships and relationships of implication with both scientific and real-world material. (Vygotsky, 1987, p. 167)

Vygotsky summarizes his decade-long collaborative research effort in *Thinking and Speech* and concludes by declaring that their work had barely begun, that they had revealed the complexity of the entity created by the unification of thinking and language processes—verbal thinking—but that they had hardly begun to analyze its nature. Events in the Soviet Union curtailed this research enterprise with the banning of Vygotsky's work in 1936. For twenty years, reading his work was forbidden in the Soviet Union and, as mentioned previously, perspectives that varied in significant ways in theory and practice from Vygotsky's heavily influenced its "rehabilitation." These factors have contributed to aspects

of Vygotsky's work being extrapolated from his theoretical framework and analyzed in isolation, diminishing their explanatory power. They are then used in research either as objects of study or as lenses or perspectives through which to examine phenomena. This has occurred with the concept most associated with Vygotsky's name, that of the zone of proximal development (ZPD). When this concept is not situated in Vygotsky's broader theoretical framework, it leads to incomplete and contradictory interpretations and applications. It is "probably one of the most used and least understood constructs to appear in educational literature" (Palisncar, 1998, p. 370 as quoted in Chaiklin, 2003, p. 41).

This concept is generally presented as "*the distance between the actual developmental level as determined by independent problem solving, and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers*" (Vygotsky, 1978, p. 86). This definition does not address the central aspect of Vygotsky's concept of ZPD—the relationship between everyday/spontaneous concepts, the strength of which "lies in spontaneous, situationally meaningful, concrete applications, that is, in the sphere of experience and the empirical" (1987, p. 220), and scientific/academic concepts organized into systems, concepts that are appropriated with conscious awareness and volition. Scientific concepts, concepts in systems, grow "downward into the domain of the concrete, into the domain of personal experience" (p. 220). Everyday and scientific concepts move in opposite directions in their development, with the everyday/spontaneous growing up from the concrete to the abstract and the scientific/academic growing down from the abstract, from systems, into the concrete. "The link between these two lines of development reflects their true nature. This is *the link of the zone of proximal development*" (p. 220).

The oft-quoted definition also does not convey the importance that Vygotsky attributes to imitation in developing the ZPD.

[A] central feature for the psychological study of instruction [teaching/learning] is the analysis of the child's potential to raise himself to a higher intellectual level of development through collaboration, to move from what he has to what he does not have through imitation. . . . [This] is the content of the concept of the zone of proximal development. (p. 210)

Vygotsky situates the concept of ZPD in his work as a whole: "The theoretical significance of this diagnostic principle consists in that it allows us to penetrate into the internal causal-dynamic and genetic connections that determine the process of development itself of mental development" (1998, p. 203) and to establish the "internal course of the process of development" (p. 204).

Vygotsky developed his methodological approach through experimentation and practice, with practice revealing the applicability, strengths, and weakness of the theory/method. There were dead ends and false starts, but Vygotsky (1987) remarks that even with them a foundation was in place guiding their work from the start: the methodological approach derived from Marx and Engels. This approach provides coherence to Vygotsky's work, a coherence that is often overlooked in the division of his work into different periods. It is important to use a dialectical approach to analyze his work and to understand the nature of the transformations that his theory and method went through. Vygotsky's methodological approach provides a foundation for sociocultural approaches to SLA, but a reexamination and reconceptualization of this methodology can open up new avenues for SLA research.

Methods for Language for Specific Purposes

JILL NORTHCOTT

Introduction

This entry begins with a general consideration of whether or not LSP has distinctive teaching methods and it then gives an overview of seven common methodological features of LSP instruction. The entry concludes with developments in LSP which have led to methods now considered as distinctive areas of language teaching in their own right.

First of all, a few words about terminology. The term LSP is used sometimes to refer specifically to English, sometimes to include English, and at other times to exclude English. Another source of confusion is the fact that the same acronym can refer to both *language* and *languages*. Sometimes LSP and ESP are used synonymously. In this entry the term LSP (language/s for specific purposes) is used to refer to both English and other languages unless otherwise specified. The term ESP is used in referring to the work of others. Many methodological developments occurred first in English, simply because of the dominance of English as a global language resulting both from and in increased internationalization. Turning to a definition of *methods*, Richards and Rodgers (2001) discuss the relationship between approaches, methods, and procedures. Both approaches and methods are concerned with language program design. Approaches are related to “theories about the nature of language and language learning that serve as the source of practices and principles in language teaching” (p. 20), methods are the realization of approaches, and procedures occur in the implementation phase, that is, in the classroom. Although the subject matter of this entry is concerned with all three to a greater or lesser extent, the primary focus is on method as the realization of an approach.

A Distinctive Methodology?

Does LSP have its own teaching methodology? The jury is still out on the question (Basturkmen, 2006). The prevailing view is that any methodology appropriate to the teaching and learning context may be used. Some writers such as Hutchinson and Waters (1987) argue that LSP has borrowed from general language teaching methods, and others, including Johns and Dudley-Evans (1991), argue the opposite. Considering languages other than English, Grosse and Voght (1991) maintain, in their review of developments in teaching LSP in the US, that similar methods are used in LSP and non-LSP courses. The difference is in the context in which the language is learned rather than the content: “The context of oral and written discourse and learning activities is drawn from professional content areas such as business, engineering, or medicine” (p. 182).

The growth in LSP, which moved from the teaching of specialized vocabulary, primarily for reading purposes, to a large-scale movement, coincided with the development of communicative language teaching (CLT). The perhaps inevitable consequence is that there are shared methodological concerns. The focus shift from a structural to a functional view

2 METHODS FOR LANGUAGE FOR SPECIFIC PURPOSES

of language use with the consequent emphasis on new methods for language teaching lends itself naturally to LSP. In distinction from more general approaches to language learning, ESP is, to quote Harding,

the language for getting things done . . . In ESP the practical application and use of language overrides other aspects of language learning. The vocation can be anything from A to Z, from architects to zoologists, by way of bricklayers, lawyers and tour guides. (2007, p. 6)

In other words, it begins from “a functional account of learner needs” rather than a structural approach to language (Richards & Rodgers, 2001, p. 21). According to Belcher:

the functions that should be taught were seen as best discovered through analysis of learners’ specific needs, hence the impetus for the language, or English, for specific purposes (LSP/ESP) movement. The interest in language learning processes led to teaching methods that facilitated classroom interaction and discovery (inductive) learning, thus socio-cognitive growth. (2009, p. 230)

LSP methods have developed in an eclectic fashion because of this centrality of the needs-focused approach to language education. There is no one clearly defined and universally applicable LSP method. However, the need for LSP educators to find methods best adapted to their learners’ needs has resulted in the development of appropriate methods which, in many cases, have subsequently been taken up by mainstream ELT teaching. As Hyland (2006, p. 89) asserts: “principled teaching is not about pre-packaged methodological products, however, but the individual teacher’s construction of personal, context-specific frameworks which allow him or her to select and combine compatible procedures and materials in systematic ways for a local context.”

Choice of method will not only depend on the characteristics of the LSP learners and the situations of language use but will also consider other variables including course content and teacher background. One key variable in this area will be the level of understanding the teacher has of the learner’s academic discipline or professional background. Northcott (2008) shows the interrelatedness of methodology, learner context, and teacher background in one area of ESP, teaching English for law. Swales (2007, p. 279) points to the country and region dimension to priorities in ESP. Differing focuses will also have an impact on selection of methods in the classroom. “South America stresses reading comprehension, Scandinavia specialized translation, Eastern Europe terminology, the US disciplinary teaching by international teaching assistants, France semiotics, and Spain genre analysis.”

Different taxonomies of ESP methods have been produced but what writers concur on is that methods are essentially eclectic, and there is no one method for LSP. It is, however, possible to identify methods which occur frequently in many types of LSP teaching. Basturkmen (2006) provides a helpful framework for consideration of LSP methods by dividing them on the basis of whether they are predominantly input or output focused. She makes the distinction between exposing students to authentic texts and comprehension activities in the belief that this input-focused method will be sufficient to develop students’ language competence and an input to output method where students then produce their own examples (as in a genre-based approach). Output-focused methods begin with production of the target language as in, for example, medical students conducting a patient consultation. Output to input methods involve post-teaching of the language required by the students to perform the task. For example, business professionals taking a report-writing course might be required to write a report at the beginning of the language program.

This would then be used diagnostically to identify areas of difficulty which then provide the teaching agenda for subsequent sessions in the program.

Common Methodological Features of LSP Instruction

Some areas considered in the literature, such as learner-centeredness and learner autonomy, have not been considered separately as they are, it is maintained, implicit in the methods described below. Indeed, the emphasis in LSP on needs analysis leads naturally to a focus on learner-centeredness. Content-based instruction (CBI), an approach realized in much LSP teaching, receives attention in the next section of the entry.

There are seven areas common to LSP methodology worth examining more closely.

1. *Disciplinary methodology.* LSP “makes use of the underlying methodology and activities of the disciplines it serves” (Dudley-Evans & St John, 1998, p. 4). Grosse and Voght (1991, p. 182) propound a weaker version: “LSP course content and class activities are geared closely to professional goals.” The question for the classroom practitioner to consider is how to use the methodology of the discipline in designing a language program geared to the learners’ professional goals. This methodological principle in both its weak and strong versions is reflected in the choice of learning activities. For example, EAP students may participate in language classes structured in a similar manner to university seminars; law students can develop their language skills through initial attempts at writing case summaries. Engineering students may describe, either orally or in writing, how something works or report on a process. Business students, particularly at MBA level, and professionals can both use case studies. Using the expertise of the learner in the LSP classroom is advocated for both professionals and high-level students of a particular subject such as MBA students. However, pre-experience students may not yet have sufficient understanding of their subject for this to be a viable alternative. In response to this difficulty the LSP classroom will sometimes use input material at a cognitively simpler level than that required by the target situation. For example, undergraduate law materials may be used as source material for developing legal English skills with postgraduate law students. De Rycker (1997) describes the use of school textbooks as the basis for a syllabus to teach both business and business English to business undergraduates. This, however, may be problematic in the light of (2) below.
2. For Coffey (1984), *authenticity* is the key issue in ESP methodology. However, Jordan’s (1997) view that pedagogic purpose is the main consideration when choosing whether or not and at what stage to use authentic texts reflects mainstream opinion. This is linked to authenticity of text and task (Widdowson, 1979) resulting in role-play and simulation activities mirroring real-life professional communication. For example, business learners participate in meetings and negotiations; medical English learners in doctor–patient interactions. The goal of such activities is “not just to serve as vehicles for developing communicative competence but to equip students with language learning and personal problem-solving strategies (e.g. increased metacognitive awareness) that they can carry with them into their target communities” (Belcher, 2009, p. 9). The texts used by the learners will generally be authentic to the discipline or profession, rather than material written for language teaching. Some advocate a strong version of the authenticity principle maintaining that only authentic texts should be used in the LSP classroom.
3. *Genre awareness* has played a central role in LSP methodology. This is perhaps seen at its most explicit in the area of EAP, where rhetorical conscious-raising methods predominate. The target discourse, for example a research paper, is analyzed from a genre

perspective to identify the various moves and the language employed to make those moves identified. The purpose is to both socialize students into the expectations of their particular academic discourse communities and enable them to become more effective readers and writers. Focusing on language is seen not as an end in itself but as the means to become aware of the role of grammatical and lexical choices in creating meaning. In business English work has been done to identify the genre features of specific written and spoken business communication events, such as management reports, sales letters, sales negotiations, and decision-making meetings. The teaching method focuses on developing learners' awareness of these features in order to help them reproduce them in their own written and spoken communication. Since recent research indicates that genres are evolving, and therefore less fixed than previously thought, classroom methods have been developed to ensure that students do not rigidly and inappropriately reproduce sample genres. Johns (2009) advocates getting students to research new academic scenes and then develop their skills to participate in these through role-play, building on the work of Lynch and Anderson (1992).

4. *Task-based learning* has proved a popular method for many LSP situations and learners. Premised on a strong view of CLT, learners engage in the performance of a task (either real-world or pedagogical) where the focus is on meaningful activity and reaching an outcome. The use of language is a tool for the successful completion of the task and the focus is not on the successful production of target forms of the language. This approach lends itself to the construction of relevant language programs and materials. Learners will perform a real-world task such as participating in a lawyer–client interview (English for law). The task may be performed early in the language program, making use of deep-end strategy, so that the learner has to draw upon the language resources he or she has, combined with, in the case of work-experienced learners, his or her knowledge of the demands of the situation. This method involves post-task teaching of the language needed for successful performance of the task and an opportunity to repeat the same or a similar task later in the program, thus demonstrating the learner's improvement in mastery of the communicative demands of the situation. This presupposes that learners will develop their language when pushed by actual use to do so. It is a method which has proved particularly popular for teaching business professionals as it mirrors the pressure of working in the business world. According to Phillips (1981, p. 93), tasks "must reflect the structural characteristics of the learner's special purpose."
5. *Problem-based learning* is in many respects similar to task-based learning. Developed for the purposes of educating medical professionals it is now widely used in doctor and nurse education in many parts of the world. Students are trained by exposure to a particular case which they discuss in small groups in order to reach a diagnosis. On the way they will need to read and consult a variety of sources. This has been adapted to different LSP learning contexts, principally but not exclusively, within English for medical purposes. Barron (2002) for example, used a PBL method to teach science students. Belcher (2009) advocates the use of PBL in nursing education. On a smaller scale, PBL tasks adapted to specific disciplines including business, engineering, and law are a common feature of ESP classroom practice. For example, in an English for Legal Studies program at the University of Edinburgh law students develop their spoken legal English by working in small groups with tort cases, identifying the parties, the legal issues involved, and judging the likelihood of success should the case come before the courts.
6. *Team teaching*. This is a method considered particularly suitable for EAP contexts where language teachers may lack the depth of disciplinary knowledge necessary to be able to analyze the target discourse and situational needs, combining the resources of both

language and subject specialists. There is a relatively rich literature on the theme of liaison between subject specialists and ESP teachers in academic settings. Swales (1988) referred to early accounts of team teaching published in smaller journals as “reports of various types of cooperation, . . . ESP staff ‘sitting in’ on lectures, of joint preparation of assignments . . . of the ESP tutor acting as ‘language assistant’ in subject classes and so on” (p. 138). The publication of Johns and Dudley-Evans’s (1978) account of team teaching at Birmingham University began to change what was understood by team teaching. Dudley-Evans (2001), drawing on Barron (1992) developed a framework for understanding these “various types of cooperation” with subject specialists, categorizing them under three areas: cooperation, collaboration, and team teaching, depending on the extent of the cooperative relationship. The extent of cooperation ranges from a low level of cooperation where the LSP teacher consults the subject-specialist informant about aspects of the discipline to collaboration with the language teacher and subject teacher working outside the classroom to devise materials together to team teaching which involves both teachers working together in the same classroom. Northcott and Brown (2006) give an account of team teaching adapted to a very specific professional LSP context, training legal translators and interpreters in the Baltic countries.

7. *Use of computer-based resources.* Corpus linguistics research has shown the very different characteristics of discourse in different disciplines and lent support to the call for discipline-specific LSP (e.g., Hyland, 2002). The widespread availability of concordancing programs, corpus resources, and networking tools has made the search for examples of authentic language use much easier with the availability of lectures, interviews with business people, and business training material on the Web. Live blogs and other so-called Web 2.0 features and subject-specific portals make easy access to disciplinary and professional communities of practice a more realistic goal. Many LSP programs, particularly those designed for busy professionals, are organized on a blended-learning basis, combining face-to-face tuition with access to computer-based language resources.

Content-Based Methods and Approaches

As a result of increasing internationalization of English, there is a growing emphasis on teaching subject matter through the medium of English (see, e.g., Fortanet-Gómez & Räisänen, 2008). CBT has developed into an approach to learning in its own right with a growing research base. Content and language integrated learning (CLIL) is content-based language teaching, predominantly for young learners, and appears to be an increasing practice both in Europe and further afield. The primary aim is not to learn the language but to acquire the content of the subject specialty although language and skills of communication play a substantial role within the curriculum (Marsh, Marsland, & Stenberg, 2001). Subject specialists are being required to teach their subjects in English leading to the reverse of the LSP conundrum. For LSP teachers a reoccurring major concern has been lack of subject-specialist knowledge. For CLIL practitioners, the gap can be a lack of understanding in how to use appropriate methods in the classroom to develop students’ language competence. The experience of LSP practitioners in using and adapting existing methods and developing new methods for unique LSP contexts can play an important role in filling this gap.

Conclusion

It could be argued that this entry does not, in fact, answer the original question of whether or not LSP has a distinctive methodology. However, the lack of a clear-cut answer is wholly

consistent with the nature of LSP, essentially an eclectic, learner-centered approach to meeting the real language learning needs of both professionals and students in various discourse communities. LSP teachers have the flexibility to adopt and adapt new methods from a variety of disciplines. “Freedom to innovate,” in Strevens terms (1980, p. 120), remains central to LSP.

Minority Languages in Education

DURK GORTER

Introduction

Minority languages are commonly defined in relationship to the country where they are spoken. Most countries recognize only one official language, a small number of countries are bilingual (e.g., Canada, Finland, Ireland, Paraguay, the Philippines, and Tanzania) and only a handful of countries recognize three or more languages, such as Belgium (3), Luxembourg (3), Singapore (4), Switzerland (4), South Africa (11) and India (23). Since there are about 200 independent countries and an estimated 6,000–7,000 languages in the world (Lewis, 2009), it is easy to understand that by far most languages are minority languages. Various labels are applied to the language varieties used by minority groups. "Minority" language can also be referred to as "heritage," "indigenous," "ethnic," "lesser used," "stateless," "non-dominant," "threatened," "regional," "immigrant," "minorized," "tribal," or "endangered" language. These designations overlap but they are not all synonymous. One label is often preferred over the other because an implicit denigrating meaning of the word is perceived. In the applied linguistics literature "minority language" seems to be used most frequently and here it will be used as the common denominator. The logical contrasting label is of course "majority language." Here also different designations exist: "dominant," "national," "official," or "state" languages among others (see Grenoble & Whaley, 2006, p. 14).

Different criteria can be used to designate a social group as a "minority" or a "language minority" (Capotorti, 1979). However, there is no generally accepted definition of what constitutes a minority language. The definition given in the Charter for Regional or Minority Languages of the Council of Europe seems to have gained wide currency. The charter refers to

languages that are traditionally used within a given territory of a state by nationals of that state who form a group numerically smaller than the rest of the state's population and [are] different from the official language(s) of that state.

This definition is not undisputed because the charter explicitly excludes "dialects of the official state language(s)" and "the languages of migrants."

In Europe and in some other countries there is an important separation between regional languages and the languages spoken by immigrants (Extra & Gorter, 2008). The first category concerns (mainly) territorial minorities created during state-formation or because of migration of population groups "since time immemorial." The difference with the second type, however, can be gradual. Immigrant minority languages are the consequence of more recent international migration processes, which started in Western Europe primarily in the 1960s. Due to an influx of migrants, expatriates, refugees, and asylum-seekers in many European states today over 100 different languages are spoken at home, in particular in the larger urban areas. This is also the case in many regions where a historical minority language is in use, such as Catalonia, Wales, or Friesland.

The fact that their existence is not secured is a feature most minority languages have in common. For some language groups this is an urgent issue and they may be labeled “severely endangered” or “moribund” (Moseley, 2009). For other groups the threat is more felt in the long run because of the pressure of other dominant languages.

In this entry the emphasis is on the education of regional minority languages in Europe, although worldwide there are many similar issues involved in the education of minority languages. It will be obvious that minority language education can cover many different situations. The continuum may range from covering only a temporary extracurricular provision for a small group of speakers to extending a minority language provision through all stages of education, from the youngest ages onwards until university and life-long learning facilities for adults.

Education Rights and Minority Languages

Already in 1953, the UNESCO report, “Use of Vernacular Languages in Education” stated “it is axiomatic that the best medium for teaching a child is his mother tongue” (UNESCO, 1953, p. 11). Today the approach is called “mother tongue-based multilingual education” (MLE). Learning the mother tongue first is an important point of departure, but learning the official state language is also encouraged as well as the learning in one or more foreign languages (UNESCO, 2007). Building on the mother tongue as a strategy in bilingual or multilingual education has been supported by research (Benson, 2009). However, UNESCO’s work thus far has been largely neglected by policy makers and school authorities. The issue continues to be that children often enter a school where “they are expected to learn a new language at the same time as they are learning in and through the new language. The basic problem is that children cannot understand what the teacher is saying!” (Dutcher, 2004, p. 8).

Many other international documents support the teaching of minority languages, such as The Hague recommendations of the OSCE accepted in 1996, or the Universal Declaration of Linguistic Rights accepted in the same year (Skutnabb-Kangas, 2008). However, because those instruments cannot be legally enforced they are predominantly a moral appeal for linguistic human rights.

In the 1990s the Council of Europe established two important instruments, the Framework Convention for the Protection of National Minorities and the Charter for Regional or Minority Languages. They are rather different instruments because the framework convention protects minorities (thus groups) and the charter concerns languages as cultural assets (Woehrling, 2006, pp. 32–3).

The goals of the Framework Convention are rather broad. For education, the aim is to “foster knowledge of the culture, language and history of the national minorities, also among the majority” (article 12) and “the recognition of the right to learn the minority language” (article 14). The last article confirms the fundamental right to obtain at least some minimal minority language teaching provision.

The Charter for Regional or Minority Languages can be considered more important for language revitalization, in particular for education (Dunbar, Parry, & Klinge, 2008). The charter can be seen as a yardstick on how states ought to deal with the minority languages inside their borders. It offers each state that ratifies it a range of measures to promote the use of regional or minority languages in public life. The measures are presented as an à la carte menu. For each minority language specified at the time of ratification something has to be chosen from each course according to the specific situation of that particular minority language. As far as measures in the field of education are concerned, the minority language should be present “at all appropriate stages” of the education system. Given the

contextual variety the European language minorities find themselves in, the selected measures differ widely between the different states (Grin, 2003).

Most states have chosen a conservative approach, where they sign at the lowest level of an obligation (to favor, encourage, or both). In spite of this, in many cases the charter is a step forward compared to earlier complete disregard by the authorities. A gap frequently continues to exist between the legal arrangements and de facto implementation. States are generally not easily ready to accommodate to the demands of minority language speakers. States have typically built their own educational system over a longer period of time based on an ideology of national homogeneity.

School Practices

Most formal language learning in society takes place in education. For language planning, education is as an essential tool for “producing” new speakers (Nelde, Strubell, & Williams, 1996). When education is successful it strengthens a language group. The majority language often dominates the schools, but it is often not the language of the minority speakers. As a consequence students learn the majority language best and may prefer that language for many other functions as well.

The position of the minority language in the educational system is influenced by a multitude of factors, such as historical events, legal mechanisms, official language policies, socioeconomic development, or media provisions. But language use in society, language attitudes, group identity, and so on can also all have an influence on how a minority language will be taught.

The weight of the minority language in the school curriculum is a major concern. Central is how much the minority language is really taught and what the outcomes are. A small amount of symbolic attention to the minority language, such as teaching it as a subject for a few hours per week, can easily result in transition to the dominant language. Formal bilingual education can thus lead to the usage of the dominant language rather than to the maintenance of the minority language.

In the Euromosaic study it was found that about half of 48 minority language groups in the European Union scored low on a five-point scale for education provisions (Nelde, Strubell, & Williams, 1996, p. 65). In a comparison of 29 cases in the European Union, Gorter (2008) found that the minority language is taught in 14 communities as a subject to 50% or more of all primary school children. Only a small proportion of schools teach more than half of the subjects through the minority language. The quality and the final proficiency may be as important as the number of hours. Yet, only a few minority groups have succeeded to obtain reasonably strong provisions for language education. We can think of Basque and Catalan in Spain, Welsh in the United Kingdom, or, beyond the European Union, of Māori in New Zealand. Today those languages are supported by an education system which could hardly have been anticipated 30–40 years ago. In those exceptional cases a slowing down of language shift and an apparent reversal has been achieved.

Most minority languages lack a tradition as language of instruction in the schools. In many cases their appearance in the education system is of recent date. Minority languages share much, but they also differ in respect to official recognition by the authorities, protection in educational laws, place in the school program, quality of teachers, development of learning material, availability of new technologies, presence of immigrants, and the attraction and prestige of English. There is a paradox that multilingualism is generally seen as an asset when it concerns English as a second language but not in the case of minority languages.

Future Challenges

Almost all minority languages in the world are seriously endangered (Moseley, 2009). Processes of homogenization and globalization have led to a reaction on behalf of minority languages during the last decades. Many efforts at language revitalization are being attempted. Stronger provisions for minority language education are an important contribution to language revitalization. At the end of their school career students have to be competent bi- or multilingual speakers who are literate in two or more languages.

An adequate education system contributes to the maintenance of the language but does not guarantee in itself intergenerational language transmission or the persistence of language use (Fishman, 2001). A robust educational policy for a minority language can lead to success, but it is hard to achieve a sustainable future for a language. To imagine the ideal school where multilingualism is the ruling ideology is possible, but far from reality (Shohamy, 2006, p. 173). Minority language communities have to find ways to teach their language to the next generation. Schools can produce proficient multilinguals, but most minority language groups do not receive such multilingual education. However, even in the strongest cases the challenge remains to turn proficiency into real use of the minority language outside the classroom and in the society (Gruffudd, 2000).

Research Areas

Some interesting research areas on minority language education can be mentioned. First of all, studies of the relationship between multilingual identities, the national state and processes of globalization, and what happens inside the school and during classroom interaction. This is an area that has recently developed. These studies also are important for minority groups (May, 2008). Second, investigations of school achievement when a minority language is the medium of instruction. This approach has characteristics in common with content and language integrated learning (CLIL), an area that has attracted much attention in Europe. This approach analyzes different (linguistic and non-linguistic) elements of the curriculum (Joaristi, Lizasoain, Lukas, & Santiago, 2009). Third, linguistic landscape studies, understood as the language used in texts in the public space, comprises studies involving minority languages which prove relevant to analyze patterns of multilingualism and the effect of language policy (Shohamy & Gorter, 2009). The school context is a relevant field of further research into linguistic landscapes.

Mixed Methods

DAN KIM

Although the dichotomy between quantitative and qualitative methodology traditions still stands with a considerable weight in applied linguistics research, the mixed methods approach has strengthened its position as an alternative to single-method research. The major factors leading to the spread of mixed methods research include the widespread acceptance of qualitative research, the complexity of our research problems today, and the development of the various methods involved in mixed methods research (Creswell, 2008). While the movement has been especially vigorous in educational evaluation, the increasing amount of qualitative research in applied linguistics shows that “methodological eclecticism, rather than adherence to established traditions, is now the dominant characteristic of published qualitative work” (Benson, Chik, Gao, Huang, & Wang, 2009). Applied linguists such as Zoltan Dörnyei even recommend considering “applying a mixed method research design in every situation” (2007, p. 313), as mixing methods may bring out richer information than opting for a single methodology.

The mixed methods research methodology involves a process of collecting, analyzing, and mixing quantitative and qualitative methods to answer a research question. The decision to use different methods in a single study largely depends on what is the most appropriate way to approach the research question at hand and how mixing different methods helps better achieve the purpose of the study than using a single method. The underlying belief of adopting a mixed methods approach is that making use of both qualitative and quantitative methods in combination will provide a better and enhanced understanding of a research problem or issue than choosing either method alone. Tashakkori and Teddlie (2003) go further from the definition that mixed methods is a combination of different methods, and claim that “mixed methods research has evolved to the point where it is a separate methodological orientation with its own worldview, vocabulary, and techniques” (p. x).

Stances on Mixing Paradigms

Mixing methods means more than merely using multiple methods: rather, it also implies mixing different paradigms, or mental models, that are represented in different method epistemologies. The terms “mixed methods” and “multimethods” are sometimes used interchangeably, but, according to Pat Bazeley, multimethod research is when different methods are used in parallel or sequence but not integrated until inferences are being made, whereas mixed methods research involves interaction between and within the methods whose occurrence is not limited at the concluding point (Johnson, Onwuegbuzie, & Turner, 2007, p. 119).

There have been six main stances of viewing mixed method paradigms. The *purist stance* at one extreme claims that important philosophical differences exist between and amongst different paradigms of inquiry, and therefore methods and paradigms cannot be mixed: within each paradigm, assumptions form an interconnected whole that must be respected and preserved (Lincoln & Guba, 1985; Smith & Heshusius, 1986). In the *pragmatic stance*, philosophical differences exist, but they are logically independent of one another; therefore,

2 MIXED METHODS

the differences can be mixed and matched because they are descriptions not prescriptions for practice, and inquiry decisions should be driven by the practical demands of the problem (Reichardt & Cook, 1979; Patton, 2002). From the perspective of the *substantive theory stance*, philosophical differences are not as important. Instead, what matters more and what should guide methodical decisions are the substantive issues and conceptual theories relevant to the selected context (Cooksy, Gill, & Kelly, 2001). The *complementary strengths stance* acknowledges the philosophical differences between methods, but takes the view that paradigms are not fundamentally incompatible: paradigm differences are important, and they need to be preserved without being altered or corrupted. Hence, the methods in mixed methods inquiry should be kept separate in order to preserve and maximize the integrity and strengths of each method (Brewer & Hunter, 1989; Morse, 2003). The *dialectic stance* also accepts paradigm differences and their importance, and it especially emphasizes the meaningful engagement and the creative tension between different methods and their mental models in order to achieve dialectical discovery of enhanced or new understandings of the phenomenon (Greene & Caracelli, 1997, 2003). Finally, the *alternative paradigm stance* claims that historical and philosophical differences among paradigms are reconcilable through emergent paradigms such as contemporary pragmatism, new realism, or emancipation; what should guide mixed methods practice is a new paradigm that actively embraces and promotes the mixing of methods (Tashakkori & Teddlie, 1998; House & Howe, 1999).

Purposes of Mixing Methods

Why do researchers choose to mix methods? As the paradigms behind the method choice are diverse, researchers may have different purposes in choosing the mixed methods approach. Greene, Caracelli, and Graham (1989, p. 259) presented five purposes of mixing methods:

1. The *complementarity* purpose seeks elaboration, enhancement, illustration, and clarification of the results from one method with the results from the other method to increase meaningfulness.
2. The *expansion* purpose seeks to extend the breadth and range of inquiry by using different methods for different inquiry components.
3. The *triangulation* purpose seeks convergence, corroboration, and correspondence of results from the different methods to increase validity.
4. The *development* purpose seeks to use the results from one method to help develop or inform the other method, where development is broadly construed to include sampling and implementation as well as measurement decisions.
5. The *initiation* purpose seeks the discovery of paradox and contradiction, new perspectives or frameworks, the recasting of questions or results from one method with questions or results from the other method.

Researchers first need to fully understand the strengths and weaknesses of quantitative and qualitative research methods in order to identify the purpose of mixing methods. The purpose should guide the remaining process such as design and analysis strategies.

Mixed Methods Research Designs

Several typologies for mixed methods research design have been developed based on various dimensions to consider when planning a mixed methods study. Creswell's mixed methods design typology categorizes research designs based on the purpose and process

of using multiple methods. Creswell (2008; Creswell, Plano Clark, Guttman, & Hanson, 2003) claims that the decision to choose which type of mixed methods design to adopt largely depends on the following criteria: Will data be collected concurrently or sequentially? Will you give priority to quantitative or qualitative data? What is your worldview? Who is your audience? Concurrent designs include triangulation, nested, and transformative designs (Table 1). Triangulation design is used when comparing tendencies with multifaceted perspectives, or when attempting to validate findings from quantitative method with qualitative data. In a triangulation design, the researcher often gives the same priority to both quantitative and qualitative data and compares the results from quantitative and qualitative analysis to determine if the two data sources yield similar or dissimilar results. The nested design is used when giving less priority to one type of data than the other and when using quantitative data and qualitative data separately to answer different research questions. In a nested design, the researcher collects both quantitative and qualitative data simultaneously, asking different questions with each data source. Qualitative data may be implemented within quantitative data, or vice versa. Concurrent transformative design is similar to triangulation design in terms of the stage of integration, implementation, and priority of the methods used, but, unlike other concurrent designs where theoretical perspectives behind the method choice may be present, concurrent transformative design explicitly takes a theoretical stance. Sequential designs can either be explanatory or exploratory. The explanatory sequential design is used to explain quantitative findings with qualitative data and to identify cases for qualitative data collection from quantitative findings. In an explanatory sequential design, the researcher places priority on quantitative data collection and analysis and collects quantitative data first in the sequence. Qualitative data are used to enhance or explain the results of the quantitative data. The exploratory sequential design can be used when an instrument has not been decided on yet and the

Table 1 Mixed methods design typology (Creswell, Plano Clark, Guttman, & Hanson, 2003, p. 224)

	<i>Stage of integration</i>	<i>Implementation</i>	<i>Priority/status</i>	<i>Explicit theoretical perspective</i>
Sequential	Interpretation	QUAN->qual	Usually QUAN, can be QUAL or equal	May be present
• Sequential explanatory				
• Sequential exploratory	Interpretation	QUAL->quan	Usually QUAL, can be QUAN or equal	May be present
• Sequential transformative	Interpretation	QUAL->QUAN QUAN->QUAL	Either dominant or both equal	Definitely present
Concurrent	Interpretation or analysis	QUAL+QUAN	Equal	May be present
• Triangulation				
• Nested	Analysis	Qual within QUAN Quan within QUAL	Either dominant	May be present
• Transformative	Usually analysis, can be interpretation	QUAL+QUAN	Either dominant or both equal	Definitely present

researcher wants to explore first in order to identify questions or variables for the instrument. In an exploratory design, the researcher emphasizes qualitative data rather than quantitative data, in order to build upon the initial qualitative findings.

Mixed Methods Data Analysis

When analyzing mixed data, two types of analysis are commonly used: (a) parallel/sequential (nonintegrated) tracks analysis, and (b) integrated analysis. In the parallel/sequential tracks analysis, the analysis process takes place in a sequence. The researcher may either incorporate quantitative data into a qualitative analysis, or incorporate qualitative data into a quantitative analysis. Figure 1 shows an example process of a parallel tracks analysis. Integrated analysis adopts a concurrent analysis of both qualitative and quantitative data. The researcher moves back and forth between different data sets throughout the whole analysis process. Figure 2 shows an example process of an integrated analysis.

As the figures demonstrate, the major activities of data analysis are to reduce, transform, and organize the raw data to an organized form that allows for inferences, for assessing interrelationships and patterns within the data set, and for generating and validating inferences, conclusions, or interpretations. First, in the data cleaning, reduction, and transformation stages, the data sets must be compiled, organized, selected, graded, and finally

transformed into manageable pieces through thematic categorization, coding, and discovery of patterns. In a parallel tracks analysis, these stages are done separately between different data types, and developing data analysis mechanisms such as a category system and a theme matrix helps organize raw data in different form and volume into a comparable set of data. Data comparison and consolidation are the unique stages in mixed methods analyses. Data comparison is used for exploring interrelationships among different data sets, and data consolidation is done by combining or merging two data sets into one consolidated data set representing a new or enhanced set of constructs. Finally, data integration is for synthesizing different types of data to achieve a coherent and holistic understanding of the research findings.

Quality Issues in Mixing Methods

The quality criteria for mixed methods research are essentially relevant to warranting the mixing process and the result of inferences. This process is not just about the technical aspect of conducting a mixed methods study, but also involves problematization of ethical or relational criteria in the mixed methods research (Caracelli & Riggins, 1994). Taking

a metaphorical analogy can help conceptualize the quality criteria for a mixed methods study. For instance, the research has to have good foundations and understanding of the method choice, as the conductor of an orchestra must have good knowledge and technical basis for orchestrating different instruments/players and other factors in the course of a performance. The research has to be consistent with the mental models accompanied by the method choice, as orchestrating music also has to relate to the musical theme throughout the whole performance. In using multiple methods, balance and consideration for other instruments is the key leading to a harmony. The main player and supporting player(s) must have an understanding and consensus between and amongst each other as to when to maximize their own techniques and capabilities, and when to allow other players to shine. Finally, the researcher has to take full responsibility in the whole decision-making and execution process of conducting a mixed methods study, and this really is an integral process of building trust with the audience as a mixed methods researcher.

One additional (and crucial) factor to consider is that as different methods and data clash and mesh, researchers may confront unexpected phenomena or issues while engaged in the mixed methods research process. Dealing with the emergent themes and incorporating them into the process of interpretation is another important role of a mixed methods researcher in ensuring the quality of research.

Using Mixed Methods in Applied Linguistics Research

Benson and colleagues (2009) surveyed qualitative data-based articles in 10 major journals in applied linguistics between 1997 and 2006. They found that the number of multimethod studies was quite large but most of them made limited use of mixing methods. For instance, there were a number of survey research studies that included a few open-ended items or some observational data. However, they observed that there were a relatively small number of noticeable studies (that they categorized as qualitative), which employed both quantitative and qualitative data as “a deliberate strategy to weigh the two types of evidence against each other” (2009, p. 87). Beside the categorization of multimethod studies by Benson and colleagues, it seems that detailed investigation of the purposes, design, and analysis of mixed methods research in applied linguistics is yet insufficient.

Lazaraton (2003) observed that the two most common qualitative approaches in applied linguistics research are ethnography and conversation analysis. Some statistical analysis incorporated into ethnographical or conversation analysis research may be the most common form of mixed methods approach in applied linguistics research. Kim (2008) reported on a mixed methods study investigating an English for occupational purposes (EOP) context in Korea and exploring the connection between EOP and general training. The study utilized a case study within an EOP institution consisting of field observations and interviews, and the ethnographical investigation was supplemented by a quantitative measure (i.e., survey) in other equivalent EOP institutions in Korea. The purpose of mixing methods in this study was to complement the qualitative data with quantitative findings by capitalizing on the strengths of each method, and the researcher implemented parallel tracks analysis to compile and integrate the mixed data. The design of the study adopted the concurrent nest design, where the quantitative measure was nested within the dominant qualitative investigation. The integration occurred primarily at the analysis phase, although the researcher observed frequent interaction between the two types of data at prior stages as well (Kim, 2008, p. 66). In addition to answering the research questions by using multiple methods, the study allowed for emergent themes such as the discrepancy between perceived and actual needs for EOP training. Dörnyei, Durow, and Zahran (2004) conducted an interview study to complement the results of a larger survey of 70 students in investigating language learners’ acquisition of formulaic sequences. The study utilized a sequential

exploratory design, where the interview data were later accompanied by interpretation of various aptitude and motivation scores of the interviewees. The quantitative findings were used to gain more generalizability of the qualitative findings.

More varied cases of using linguistic data such as conversation analysis data in mixed methods research are needed for establishing a mixed methods tradition in applied linguistics research.

Mnemonics

JOE BARCROFT

Definition

Mnemonics (mnemonic devices or techniques) are mental aids that help us to remember different types of items and information, such as new word forms, names, historical dates, numbers, formulas, and various rules and lists. Typically they involve recoding or breaking down formal components of a target (to-be-remembered) item in a manner that makes these components more familiar, abbreviated, or in some way easier to remember. The phrase *every good boy deserves fudge* and the word *FACE*, for example, are mnemonics that are often used to help an individual who is beginning to learn to read music. The first letter of each word of the five-word phrase corresponds to notes on the lines on the treble clef, and each letter of the word *FACE* corresponds to the note for each of the empty spaces between the lines. Other examples of mnemonics are well-known catchphrases such as *i before e except after c*, designed to help recall spelling rules, and rhymes such as *red sky at night, sailors' (or travellers', shepherds') delight; red sky in morning, sailors take warning*, designed to help individuals know what to expect with regard to warning signs for different weather conditions (putting aside whether or not the assertion being made is correct).

Characteristics

Mnemonic devices can be classified as “artificial,” given the typically *arbitrary* relationship between specific components of a given target item and how they are recoded. The word *FACE* and the musical notes F, A, C, and E are not logically related in the real world, for example. The purpose (and memorial benefit) of using the word *FACE* is purely formal in nature. With some mnemonic techniques, recoding of the target item involves elements related to meaning (conceptual/semantic information), but the real-world relationship between the target information and how it is recoded is still arbitrary. For example, the use of rhyme is in no way needed or inherent when it comes to discussing present and future weather conditions, but the use of rhyme in *red sky at night, sailors' delight . . .* is critical as a component of the mnemonic in question because it facilitates remembering the pertinent information being conveyed. Rhyme is an arbitrary imposition into the area of weather forecasting because it helps us to retain key formal components that are needed to recall the most critical information correctly (*night > delight* and *morning > warning*). As another example, the phrase *stop, drop, and roll* used in fire-safety education probably would not be as memorable (or as quickly recalled) without the rhyme between *stop* and *drop* and the use of one-syllable words only.

Effectiveness and Durability

Mnemonic techniques are known for their effectiveness and high degree of durability over time. When it comes to memory, the feats enabled by mnemonic devices are often quite astounding. For example, compare the difficulty of remembering the phrase *May I have*

2 MNEMONICS

a large container of coffee? versus the number 3.1415926 (pi to 7 decimal places). Unless one is already familiar with pi to 7 or more decimal places, the phrase *May I have a large container of coffee?* is probably easier to learn than the number, and by learning the phrase alone, one can “remember” (or at least cite) pi to 7 decimal places simply by counting the number of letters in each word in the phrase (*May* = 3, *I* = 1, *have* = 4, *a* = 1, *large* = 5, *container* = 9, and so forth; see http://www.eudesign.com/mnems/_mnframe.htm).

Durability is another one of the defining features of mnemonics, for several reasons. First, mnemonic devices involve (recoded) formal components that are familiar in nature, which facilitates memory from the onset. Second, the familiar formal components are typically repeated as one uses them for recall over time, further imprinting these components in memory. Finally, given that the formal components become well consolidated in memory, one can recall them after extensive periods of time with no intervening recall. This *spaced repetition* and *expanding retrieval* is particularly effective at consolidating target items and information in memory (e.g., Landauer & Bjork, 1978). Therefore, if someone has learned *Every good boy deserves fudge* and *FACE* to remember musical notes, with sufficient spaced retrieval over time, most likely the individual will be able to recall these ordered musical notes for life.

Origins and History

The term *mnemonic* has its origins in the ancient Greek term *mnēmōnikós*, meaning “related to or of memory” (Mnemosyne was the goddess of memory in Greek mythology). The ancient Greeks had already distinguished between two distinct types of memory, one that is inborn and “natural” and another that is “artificial” and trained via mnemonic techniques. The art of “artificial” memory became a defining feature of the historical development known as the Art of Memory (see Yates, 1966). One account of the development of the Art of Memory dates back to the ancient Greek poet Simonides of Ceos, who purportedly was able to remember the names and the seating arrangement of guests in a building that collapsed after he delivered a panegyric in the building. According to this account, the poet utilized this experience of “successful memory” to begin prescribing memory techniques to others (see Yates, 1966). Since this time, the Art of Memory has been passed on and advanced for centuries.

Of course the study and development of mnemonics is in no way constrained to Western society. Consider the ingenious *kipu* system of record keeping used in the Incan Empire (*kipu* meaning ‘knot’ in Quechua), for example. The system involves using cords (typically cotton) with one main cord to which various other subsidiary cords were attached, and additional levels of subsidiary cords could be attached to higher-level subsidiary cords as needed. Each cord had one or many knots, and knots could be of different types, as determined by the numeric values being represented. Details on the *kipu* system and surviving *kipus* today (approximately 600 in collections worldwide) are available on the website of the Harvard-based Khipu Database Project (<http://khipukamayuk.fas.harvard.edu/WhatIsAKhipu.html>).

Varieties of Mnemonic Techniques

There is a substantial variety of mnemonic techniques available today, and new techniques continue to be developed. The following are just a few examples of the many different mnemonic techniques (or systems) that are known and readily available today. *Acronym mnemonics* (or *first-letter mnemonics*) are used for remembering lists of important words, such as *HOMES* (Huron, Ontario, Michigan, Erie, Superior) for remembering the Great

Lakes; *IPMAT* (Interphase, Prophase, Metaphase, Anaphase, Telophase) for remembering the stages of cell division; and *MET DR THIP* (Mimas, Enceladus, Tethys, Dione, Rhea, Titan, Hyperion, Iapetus, Phoebe) for remembering Saturn's moons (see <http://www.learninginfo.org/acronyms.htm>). The *method of Loci*, which dates back to the ancient Greeks (and accounts of Simonides of Ceos) involves memorizing a physical space, such as stores on a street or rooms in a house, in order to remember a series of items. One imagines walking through the space and "placing" each item in order to create a mental image of the item and a distinguishing aspect of the location (store, room) in question. The mnemonic *peg system* requires one to associate a series of numbers with a series of words. Then, in order to remember a list of items, one creates a series of mental images related to the words in question. For example, take "one is bun" and "two is shoe" as pegwords (see <http://www.thememorypage.net/peg2.htm> for more details). Using these pegwords, in order to remember to buy milk and eggs at the grocery store, one might imagine "milk poured on a bun" for the first item and "an egg inside of a shoe" for the second item.

Lists of mnemonic techniques also can be organized according to the type of item or information that one is interested in remembering. Web sites are devoted to doing this. The Mnemonics Guide® Web site (see http://www.eudesign.com/mnems/_mnframe.htm), for example, provides quick access to mnemonic devices that can be used to remember items or information from any of the following categories: astronomy, biology and nature, business, chemistry, geography/geology, history, language/literature, mathematics, music, mythology, physics, religion, society, sports and pastimes, time, and various other(s).

The Keyword Method

In the area of language learning, one mnemonic technique that has received attention and that has been the focus of empirical investigation is the *keyword method*. The keyword method is a mnemonic technique for learning new vocabulary. Originally, the technique was proposed and tested by Atkinson and Raugh (1975) for learning second language vocabulary, but it has also been tested with regard to learning vocabulary in one's first language (see, e.g., Pressley, Levin, Kuiper, Bryant, & Michener, 1982). The keyword method involves two steps. First, one recodes a novel word form into one or more known forms (e.g., recoding the Spanish word *ventana* 'window' as the English word *vent*). Second, one creates a mental image in which the recoded "keyword" (*vent*) and the referent of the novel word ('window') are connected (imagine a window with a vent in the middle of it).

Atkinson and Raugh (1975): A Seminal Study on the Keyword Method

To provide additional information about research methodology that has been used to test the keyword method, let us consider the seminal study conducted by Atkinson and Raugh (1975). In their study, 52 native English-speaking university students with no prior study of Russian attempted to learn 120 Russian target words (e.g., *dym* 'smoke'). All participants were provided with instructions on how to use the computer presentation program and practiced remembering keywords for a series of target Russian words that were not part of the main experiment. After this initial practice, each participant was randomly assigned to the experimental (keyword) or control group in a manner that ensured an equal number of female and male participants in each group. Participants in the experimental group continued to view keywords when attempting to learn the target Russian words and were instructed

to learn the keyword first and the picture and imagery interaction between the keyword and the English translation . . . [and] that if no such image came to mind [to] generate a phrase or sentence incorporating the keyword and translation in some meaningful way. (p. 128)

The control participants, on the other hand, “were told to learn [the Russian words] in whatever manner they wished [and] were not given instructions on the use of keywords or mental imagery” (p. 128). Whereas experimental subjects viewed both keywords and English translations, control participants viewed English translations alone. Whereas Day 0 of the study involved familiarizing and practice alone, on Days 1–3 each participant attempted to learn 40 of the 120 target Russian words. During each study phase, each target word was spoken, and its translation (with or without a keyword as well) was displayed for 10 s. During each test phase each target word was spoken, and participants were allowed a maximum of 10 s to type a response (the target being the appropriate Russian word). No feedback was given after each response. No partial score was given for incomplete or misspelled responses. On Day 4 a comprehensive test on all 120 words (following the same procedures as the daily test) was administered. Participants were also called back between 30 and 60 days later to complete an additional comprehensive test in a final session.

The results of the study indicated that participants in the keyword method had a mean probability of 72% of correct recall of the target words, which was significantly higher than the mean probability of 46% for the control participants, based on means from the daily tests on Days 1–3. The researchers interpreted these results by positing how keyword imagery helps to sustain a direct link between an L2 word and its L1 equivalent, a link that “sustains performance once an item is highly practiced” (p. 132). From a pedagogical standpoint, the researchers note that the keyword method should be evaluated in actual teaching situations, but if the method proves to be effective in these situations as well, then “the keyword method and variants of it deserve a role in language-learning curricula” (p. 133).

Research on the Keyword Method: Findings and Instructional Implications

Overall, studies subsequent to that of Atkinson and Raugh (1975) have demonstrated superior vocabulary learning for the keyword method over other alternative techniques (e.g., Desrochers, Wieland, & Coté, 1991; Ellis & Beaton, 1995). However, some studies have found the keyword method to be less effective than other methods. When compared to the keyword method, rote rehearsal on occasion has resulted in superior vocabulary learning (Van Hell & Candia Mahn, 1997).

Demonstrations of the effectiveness of the keyword method have inspired some researchers to call for implementing the keyword method in L2 classrooms (e.g., Levin, 1981; Hulstijn, 1997, pp. 215–19), but other researchers are more cautious considering potential downfalls of the keyword method, such as how learners might confuse keywords and the meanings of target words (e.g., Pressley et al., 1982). Additional disadvantages of the keyword method with regard to the quality of developing lexical representations are discussed in the next section.

Disadvantages of Using Mnemonic Techniques

Although the advantages of mnemonics can be readily understood by anyone who has used a mnemonic technique to remember some items that otherwise would not have been remembered, several important potential disadvantages of using mnemonic devices need to be kept in mind. In addition to challenges associated with developing appropriate mnemonics for different target items (e.g., consider the challenge of developing keyword phrases for Spanish words such as *resbaladilla* ‘slide’; possible perhaps, but not easy), most of these concern the *quality* of the memory representation promoted by mnemonics and the effect that mnemonics have on *retrieval processes* and *speed of retrieval*.

With regard to representation quality, compared to other types of learning, mnemonics promote a *mediated* variety of memory representation that may cause confusion, particularly if overused. Suppose, for example, that someone were to use the keyword method to learn 500 new words in a second language. If even a small percentage of the keyword mediators used overlap with other target words, the potential for confusion is substantial. Moreover, imagine the quality of the developing lexical network, in terms of odd associations, that learning via the keyword method would promote as compared to learning based on more direct form–meaning connections without mnemonics. For example, the act of learning the Spanish word *codo* ‘elbow’ by creating an image of a secret *code* (the keyword) on someone’s elbow promotes the development of odd associations between the concepts “code” and “elbow.” These associations would not be developed if the learner made a more direct, unmediated form–meaning connection between *codo* and its referent (‘elbow’) without using mnemonics.

With regard to retrieval, given that mnemonic techniques involve mediated components that more direct varieties of learning do not, items learned with the use of mnemonics potentially may be retrieved more slowly. The findings of studies by Van Hell and Candia Mahn (1997) and by Wang and Thomas (1999), for example, suggest that learners using the keyword method of vocabulary learning take longer to retrieve target words as compared to learners who have used rote rehearsal. Barcroft, Sommers, and Sunderman (2011) also demonstrated that form priming speeded the retrieval of words learned via rote rehearsal (as one would expect form priming to do) but slowed retrieval of words learned with the keyword method. Such findings demonstrate observable costs of mediation-based learning involved in mnemonics as compared to learning that promotes the development of more direct connections between form and meaning. Additionally, the keyword method is not designed to promote development of word knowledge beyond the ability to retrieve an L2 word form at a basic level and connect it to its L1 counterpart. In other words, it is not designed to promote other important aspects of word knowledge such as connotations, collocations, and idiomatic usage.

Summary and Conclusion

In this entry we have reviewed the definition, characteristics, degree of effectiveness, origins, and different varieties of mnemonics, as well as currently available online sources for the practical application of mnemonic techniques. Whereas the variety of mnemonic techniques currently available is substantial, we highlighted the keyword method, a mnemonic technique designed to facilitate vocabulary learning. Whereas a large number of studies have demonstrated that the keyword method is more effective than other methods of direct vocabulary learning, the keyword method has not always resulted in performance superior to alternative methods, such as rote rehearsal (Van Hell & Candia Mahn, 1997). Furthermore, it is important for instructors and learners to consider

the potential disadvantages of the keyword method and other mnemonic techniques, particularly with regard to how they may negatively affect the quality of developing lexical and other memory-related representations and retrieval processes.

Mobile-Assisted Language Learning

AGNES KUKULSKA-HULME

Mobile-assisted language learning (MALL) is the use of mobile technologies in language learning, especially in situations where device portability offers specific advantages. The main advantages are considered to be ready access to relevant help or information; more flexible use of time and space; adaptation to personal habits, motivations and preferences; continuity between learning in different settings; and greater opportunity for sustained language practice while carrying out everyday activities such as walking, waiting, or commuting. Kenning (2007, p. 192) emphasizes the opportunity for “situated learning anchored in a real-world setting” and the value of mobile technology for immediate problem solving.

Nowadays a key attraction of mobile learning is the ubiquity of portable devices. Worldwide, there were five billion mobile phones (cell phones) by mid-2010, which equates to more than three times as many phones as personal computers, and mobile phone market analysts predicted growth to six billion mobile phones by the middle of 2012 (BBC, 2010). Smartphones, and less powerful feature phones, with computing and Internet browsing capabilities, now perform many of the functions previously confined to more expensive and less portable desktop and laptop computers. At the same time, their ubiquitous presence in many areas of life encourages a blurring of boundaries between daily life, entertainment, work and learning (Kukulska-Hulme & Pettit, 2009), and thus presents a difficult challenge to conventional, orderly, formal ways of teaching and learning. While this presents many new opportunities to extend learning, there is also reason to be concerned about the increased stress of constant access.

Portable devices used for language learning include mobile phones, audio and video players (MP3/MP4 players), smartphones, electronic dictionaries, PDAs (personal digital assistants), e-book readers and games consoles. Laptops, netbooks, and tablet/slate computers also fall within the scope of mobile learning, but due to their weight and size may be considered less portable and suited to slightly more sedentary types of activity. Access to Wi-Fi connections and GPS (global positioning system) navigation multiply the possibilities for language learning on the move. Earlier experiences in mobile-assisted language learning, using mobile phones, PDAs, and iPods, are discussed by Chinnery (2006).

MALL in Relation to CALL

At first, it may seem that MALL is just another form of computer-assisted language learning (CALL), except that it involves the use of mobile technologies. However, as mobile devices now provide users with more immediate access to the Internet and to an abundance of “apps” (applications), language learners are faced with daily competition from possibly more attractive alternatives to structured learning, such as listening to foreign-language radio on the go, playing language games while queuing or waiting, or watching foreign movies while traveling. What is more, performing familiar language-learning activities but in different settings (on the bus, in a café, in a queue . . .) arguably changes the activities, as they vie for attention in noisy, changeable, stimulating environments that may be distracting or potentially enriching. Spontaneous photographing, video recording, and audio note taking become possible, thanks to the features of many current models of mobile

phones and other devices. This captured information can be disposable but it can also be a lasting memory aid and a valuable, tangible link between different learning environments—for example, a captured record of a language issue encountered in a work situation and a language class where the issue is discussed and reflected upon. For all these reasons, Kukulska-Hulme and Shield (2008, p. 273) explain that “MALL differs from computer-assisted language learning in its use of personal, portable devices that enable new ways of learning emphasizing continuity or spontaneity of access and interaction across different contexts of use.”

Location-Specific and Location-Independent Language Learning

Alongside support for easier continuation of learning between one place and another, we are beginning to see MALL applications that relate language learning to a person's physical context when mobile, primarily to provide access to location-specific language material (e.g., useful vocabulary and phrases) or to enable learners to capture aspects of language use *in situ* and instantly share and discuss them with others. Applications like these make use of technologies that detect a learner's presence and enable language-learning tasks, which may include media such as photographs, sketches, maps, audio, and video clips, to be associated with a physical space for subsequent retrieval. As technologies and learning practices develop, we are likely to see more context-aware, pervasive learning environments that detect a learner's presence in a location and provide an appropriate learning experience. One such system uses sensors in the environment to provide learners of Japanese with the appropriate polite expressions for their current context (Ogata & Yano, 2004). In a similar vein, Beaudin, Intille, Tapia, Rockinson, and Morris (2007) explored the use of sensors in the home for context-sensitive learning of vocabulary on a mobile device: sensors detected learners' interactions with objects, furniture, and appliances in the home, and this triggered the audio presentation of English and Spanish phrases associated with the use of these objects. Ogata, Yin, El-Bishouty, and Yano (2010) describe a system that detects physical objects around the learner using radio-frequency identification (RFID) tags, and assigns questions related to the detected object, to improve vocabulary knowledge; the environment also allows the learners to share their knowledge. These developments focus on the learner's mobility and interaction in a designated space. Location-specific learning can also integrate identification of local artifacts with visual or textual information about those artifacts and about local language. In this way, cultural knowledge can be brought in more seamlessly into language-learning situations, during a trip abroad or encounters with communities of native speakers. Local experts willing to share their knowledge can make themselves “discoverable” on mobile devices by those who would like to talk to them. Web-publishing tools such as blogs already provide a good way to share cultural knowledge and experience by creating shared spaces that can be constructed and accessed through a mobile device. Applications using GPS (global positioning system) are another area of growth. Smidts, Hordijk, and Huizenga (2008) describe the advent of playful and creative use of GPS in schools, drawing particular attention to the development of learning games.

Learning “out in the world,” or “in the wild” (Brown, 2010), is often informal and may even draw new people into a learning experience, for example people who happen to be present in a given place and who decide to participate. Paradoxically, many devices that support location-specific learning are also suited to location-independent learning (or so-called “anytime, anywhere” learning), not constrained by having to be in a specific place at a time determined by someone else. It includes learning that has not been scheduled in advance but becomes possible because of an unexpected event such as a period of free

time due to a train delay or a canceled meeting. This kind of learning depends on being prepared for such eventualities by having previously downloaded suitable learning resources, or being able to access appropriate online resources when needed.

Typical Applications

Different types of MALL application include those that are designed for language study and those that are not explicitly designed for language learners but can be used to support learning, for example, automatic translation tools on mobile devices. In terms of applications designed for language study, initially vocabulary and grammar learning proved to be popular and we can expect to see more innovation in these areas over time. Published studies have often reported on the use of text messaging and e-mail for vocabulary learning, including timed interval learning (e.g., Levy & Kennedy, 2005). Stockwell's (2007) intelligent tutor system created a profile of each learner and then delivered vocabulary activities according to the areas they found most difficult. Grammar practice has also received considerable attention. Samuels (2003) reported on the use of handheld computers for activities such as grammar drills, adding diacritics to Latin texts and participating in synchronous chat; Chuang (2008) explored both computer-based materials and the use of mobile phones in grammar learning.

There is no shortage of language-learning resources that can be accessed on the Web and downloaded to mobile devices, including innumerable podcasts and mobile apps. In this scenario of great abundance, finding one's way to the most appropriate, high-quality materials and resources to suit personal language-learning requirements is difficult. Although resources and applications tend to focus on the individual learner, there are some reports of collaborative language learning supported by mobile devices (e.g., Lan, Sung, & Chang, 2007). Learners may also use their mobile devices to join structured communities of online learners where language skills may be practiced with other members (Niesner, 2010). Joseph (2009) describes a "crowdsourcing" approach which combines mobile content with materials on language and culture produced by learners and shared via a community site.

Reading and Listening

With the increasing adoption of e-book readers (devices for reading electronic books) and e-book software on other portable devices, together with facilities such as integrated dictionaries, parallel texts, and tools for translation, reading in other languages becomes a more attractive possibility, especially for those who have a long daily commute or who spend most of their time away from a fixed computer. The use of mobile devices to access newspapers and other news channels has extended opportunities to read in a second or foreign language on a regular basis. Incidental learning of vocabulary from reading can be supported through e-books with dictionaries or adaptive software for vocabulary learning; however, unless learners are highly self-motivated, the effectiveness of this method of learning will always depend on good pedagogical design (Fisher et al., 2009). Access to podcasts and other audio channels has also extended opportunities to listen to other languages more frequently, on a casual basis or as part of a routine that may include regular travel. Listening activities on a mobile phone or MP3 player can be carried out successfully while sitting in the car, walking around the house and garden, or traveling (Demouy & Kukulska-Hulme, 2010).

Speaking and Writing

Portable devices make it easier for unconfident learners to find private spaces to practice speaking or pronunciation; even within the home, a computer shared with friends or family members may offer less privacy. The ability to practice speaking and pronunciation and receive private feedback from teachers, while also being able to connect and practice with other learners, were positive factors identified in a successful project with young people who were using mobile phones to learn Irish (Keogh & Ní Mhurchú, 2009). Writing practice can be more problematic since it is largely constrained by means of input such as small screens and keyboards, which can present a barrier to extensive writing. On the other hand, optical character recognition can enable learners to practice writing unfamiliar scripts such as Japanese kanji characters on phones equipped with a stylus (Koga et al., 2005). The adoption of tools for collaborative annotation of texts, for example by passing round a portable device in class, means that each learner can add a comment. Motivation may be heightened by the possibility of sharing immediately what has been written, including through mobile blogging. However, Baron (2008, p. 6) warns that myriad opportunities to write by posting messages may be eroding our collective sense that the quality of writing matters.

Support for Informal Learning

Mobile learning is increasingly poised at the intersection of formal and informal learning, with mobile devices forming a bridge between the two. In a formal education scenario, Shao, Crook, and Koleva (2007) proposed an informal mobile group blog to support students spending time at a foreign university; this enabled the students to share observations about local language use and customs. A similar intent may be discerned in the work of Pemberton, Winter, and Fallahkhair (2010), whose collaborative mobile knowledge-sharing system for language learners includes learner-generated content and a social network; this mobile and Web-based system has been designed to help international students further their knowledge and understanding of local language and culture in the country where they are studying. Other researchers have also shown interest in informal learning; for example, Song and Fox (2008) reported how some student learners of English used a mobile device to support and extend their learning in self-directed ways, driven by a goal to take every opportunity to learn new vocabulary in English. Fallahkhair, Pemberton, and Griffiths (2007) used a cross-platform approach, which employed mobile phones and interactive television for informal language learning in the home. Kukulska-Hulme and Bull (2009) related mobile learning to the issue of “noticing” in second language acquisition, arguing that mobile devices can support noticing, and that recording consciously observed features also provides a method of obtaining data on what learners notice, to complement existing experimental approaches to researching second language learner processes.

Control Over Learning

Mobile technology introduces greater flexibility into classroom teaching and it takes learning out of the classroom, often beyond the reach and control of the teacher. This can be perceived as a threat, but it is also clearly an opportunity to revitalize and rethink current approaches to teaching and learning. Some mobile learning platforms come with administration programs that track what the students do and how long they do it, and report back to the teacher. This poses a challenge in terms of the blurring of the boundary between learning and leisure time; learners can become stressed and resentful of the incursion into

their free time. It is important to develop mobile learning designs that clearly identify what is best learned in classrooms (real and virtual), what can or should be learned outside (in scheduled time and beyond), and the ways in which connections between these settings can be made. This is best done in consultation with learners.

Mobile Learners

Mobile learning appeals to a wide range of people, but there are specific groups that have been targeted or have been shown to benefit. One approach has been to give devices to students as support tools when they are embarking on their studies, including language learning; a well-publicized example was Duke University in the USA which issued iPods to all first-year students. This is based on the belief that mobile devices have become everyday tools that should also be used for learning. Some researchers have cautioned against assuming that the younger generation will automatically like using mobile devices for learning, even if they are avid users of mobile phones and music players in their everyday lives; nevertheless there is growing evidence that if the benefits to the learner of using mobile technology are made evident, uptake increases.

Mobile learners are those who benefit from mobile learning either because they are frequently mobile or because this type of learning is the most appropriate and convenient for them. In the first category are those with mobile lifestyles or whose work involves moving around different locations or substantial travel, for example business professionals needing to improve their language skills quickly on their way to a destination and for specific purposes such as interviews and meetings. In the second category are those who would otherwise find it difficult to access learning opportunities at times and locations to suit them. In addition, mobile learning may simply be a preferred way to learn. For example, learners often appreciate the increased social contact and peer support they can draw on when faced with the need to fit language-learning study and assessment deadlines into increasingly complex lives. When both online and mobile access modes are made available, some learners will opt for one of these while others will make use of both, perhaps changing from one to the other according to their needs.

Accessibility and Usability

Several projects have involved mobile populations such as immigrants who have an urgent need to improve their language skills for work and to practice local pronunciation, and the children of travelers; but such groups may not have ready access to the latest devices. Indeed, the work of Danaher, Moriarty, and Danaher (2009) with mobile communities draws attention to the fact that access to suitable technologies is often limited to the scope and duration of particular projects (p. 62).

It has also been argued that mobile device use excludes some learners who have physical difficulties. Older learners are more likely to have more problems with eyesight and manual dexterity, which may affect their ability to participate fully in mobile learning, but these problems are not limited to the older age group. The relatively small size of handheld devices presents a challenge in terms of usability (reading text, on-screen interaction), although in general this is becoming less of an issue as new device and user interface designs are continually improving. Speech recognition is likely to make interaction easier for some users and in situations where speech is a more natural medium than writing or typing. Learners with physical conditions meaning they are unable to sit upright for long periods in front of a computer appreciate being able to access reading materials on a mobile device, since this accommodates a range of reading positions. Also, students with visual

impairments or dyslexia need not be excluded if they are able to listen to digital talking books or podcasts instead of reading (Barton, Penny, & Riordan, 2007). It is advisable to involve a range of target users and a variety of physical settings in the testing and evaluation of all mobile-learning developments.

MALL Within Mobile Learning

Mobile-assisted language learning is part of the rapidly evolving broader field of mobile, ubiquitous, and contextual learning, also known more succinctly as “mobile learning.” While, in the past, mobile learning was often defined in terms of its use of mobile technologies, researchers gradually began to emphasize the mobility of the learner. Winters (2006) noted that due to the rapid uptake of mobile learning in many different communities, the concept had become ill-defined and needed to be reconceptualized, finally suggesting that “learning is mediated through mobile technologies, which are in themselves interwoven with other learning tools” (Winters, 2006, p. 11). Indeed, increasingly, mobile-learning scenarios feature portable devices being used as part of a rich repertoire or blend of technologies and media, used as and when required by learners who may extend their studies beyond the traditional or virtual classroom. Learners who are supported in this way may even be better equipped to become lifelong learners, seeking to continually and opportunistically update and improve their language competences over the course of a lifetime.

Conclusion

Mobile-assisted language learning is one of the key application areas of mobile learning. Mobile learning is proving its potential to address authentic learner needs at the point at which they arise, and to deliver more flexible models of language learning. Learner expectations, skills and habits, as well as those of teachers, need to evolve to match the potential of mobile and ubiquitous technologies. This should result in new designs for language learning that relate more closely to emerging patterns of technology ownership, time use, mobility, and access. Colpaert (2004) reflected on why mobile language learning was slow to take off, despite rapid developments in mobile technologies, concluding that teachers and researchers needed to have the tools to develop their own mobile applications. We are rapidly moving to a time when *learners* will also want to develop their own applications and to design mobile learning experiences for themselves and others.

Modality

KASPER BOYE

The term “modality” is used in linguistics for a variety of distinct but related phenomena. There is consensus that the term basically covers meanings, and most scholars use it of expressions of *necessity* and *possibility*. Many extend it to include all sorts of expressions of *degree of certainty*, and perhaps even expressions of *source of information*. Some use it in an even broader sense to cover all expressions that indicate something about the speaker’s attitude or stance toward what s/he describes. The present section will take its point of departure in the narrowest and most uncontroversial use of the term, and subsequently turn to its broader uses and to the relation between modality and mood.

In the narrowest conception, modality is associated with the notions of necessity and possibility familiar from modal logic (e.g., Lyons, 1977, p. 787; Palmer, 1979, p. 8). In English, narrow-sense modality covers expressions like *necessarily*, *possibly*, *maybe*, *perhaps* and the modal verbs. For instance, the modal verb *must* can be described as expressing necessity. In (1), it indicates that it is necessary for the prisoner to leave:

- (1) The prisoner must leave.

By contrast, *may* can be described as expressing possibility. In (2), it indicates that it is possible for the prisoner to leave:

- (2) The prisoner may leave.

Narrow-sense modal meanings may be seen as organized in three dimensions (it is not necessarily the case that all three dimensions are relevant for all modal meanings).

One dimension has to do with *modal strength*. The modal verbs *must* and *may* differ semantically with respect to strength in the sense that the former indicates a greater impact on an entity than the latter does. While (2) describes a situation where an entity (the prisoner) is simply not (any longer) prevented from leaving, (1) describes a situation in which he or she is actively forced to leave.

Another dimension concerns the location of the *modal source*. It is generally accepted that narrow-sense modal meaning implies the notion of a modal source (see, e.g., Lyons, 1977, p. 843, on the notion of a “deontic source,” and Perkins, 1983, pp. 28–9 on what he calls “C”). For instance, the necessity meaning of *must* implies that there is somebody or something from which the necessity originates. The modal source can be either internal or external with respect to the entity affected by the necessity or possibility (see, e.g., van der Auwera & Plungian’s, 1998, distinction between “participant-internal” and “participant-external” modality). With *must* and *may* in (1) and (2), it is external. Sentences (1) and (2) can be used to describe situations in which a prisoner is obliged or permitted by someone or something else to leave. With *want*, in contrast, the modal source is internal. Sentence (3) describes a situation in which something inside a prisoner—his desire—urges him to leave:

- (3) The prisoner wants to leave.

2 MODALITY

The third dimension is *modality type*. Necessity and possibility come in different types. There is a tradition in linguistics of distinguishing three modality types: dynamic, deontic, and epistemic. They pertain to, respectively, physical, social, and rational relations. The modal verb *must* can express all three types of modality. In (4), it expresses dynamic modality: for physical reasons (the fact that the door on the left is locked), the prisoner has to leave through the door on the right:

- (4) The prisoner must leave through the door on the right because the door on the left is locked.

In (5), *must* expresses deontic modality: for social reasons (the fact that the judge ordered the prisoner to leave), it is necessary for the prisoner to leave.

- (5) The prisoner must leave because the judge ordered him to do so.

In (6), finally, *must* expresses epistemic modality: for rational reasons (knowing that the speaker cannot see the prisoner), the speaker draws the conclusion that the prisoner has left.

- (6) The prisoner must have left—I can't see him.

Occasionally, other modality types are distinguished. As one case in point, a distinction is sometimes made between *subjective modality*, which pertains to relations for which the speaker is responsible, and *objective modality*, which pertains to relations for which the speaker is not responsible. This distinction seems to cut across the distinction between dynamic, deontic, and epistemic modality. As another case in point, *alethic modality*, pertaining to purely logical relations, is occasionally distinguished from the three types discussed above. While this may be justified within modal logic, however, alethic modality does not seem to be a linguistically relevant notion (Palmer, 1986, p. 11). By contrast, *psychological* or *intentional modality* might seem a linguistically significant notion. The meaning of *want* in (3) above pertains to psychological or intentional relations rather than to physical, social, or epistemic relations: (3) can be used to describe a situation in which, for psychological or intentional reasons, it is necessary for the prisoner to leave.

More often, the three modality types are collapsed into two. A distinction is typically made between epistemic modality on the one hand and “non-epistemic modality” or “root modality”—covering dynamic and deontic modality—on the other (e.g., Hofmann, 1976; Coates, 1983). This distinction highlights a difference in scope properties (e.g., Lyons, 1977, pp. 842–3; Palmer, 1979, p. 35; Perkins, 1983, pp. 7–8). Root modality is concerned with the realization of *states of affairs* (also called *second-order entities*, *actions*, or *events*)—that is, relations between entities, or rather, linguistically evoked representations of such relations. For instance, the social necessity expressed by deontic *must* in (1) has as its potential outcome the realization of the state of affairs “the prisoner leave.” In contrast, epistemic modality is concerned with the evaluation of *propositions* (also called *third-order entities* or *(potential) facts*)—that is, meanings that can be said to have a truth value (or, in a cognitively oriented analysis, representations which are stipulated to have a referent and which can thus be evaluated according to whether or not they actually do have a referent; Boye, 2010). For instance, the rational necessity expressed by epistemic *must* in (6) has as its potential outcome the evaluation of the proposition “the prisoner has left” as true. Accordingly, Palmer (2001) talks about “event modality” rather than root modality, and classifies epistemic modality as one kind of “propositional modality.”

The third dimension in particular has attracted attention in recent years. Within semantics and pragmatics, it remains an issue whether items like English *must* that can express more than one type of modality are best accounted for in terms of ambiguity, polysemy, or monosemy (see Papafragou, 2000, pp. 22–39 for an overview of the different positions). Historical linguists have focused on the order in which the different types of modality arise diachronically. One of many interesting findings is that root meanings give rise to epistemic meanings, while epistemic meanings do not give rise to root meanings (Traugott, 2006). Child language researchers have been concerned with the order in which children acquire the different types of modality. Here, one of many interesting findings is that in the case of polyfunctional items like English *must*, root meanings are acquired earlier than epistemic meanings (Choi, 2006).

As mentioned, the term “modality” has a number of broader uses as well. “Epistemic modality” is often used to cover expressions of *degree of certainty*. This use of the term is linked to the narrow use discussed above in that expressions of epistemic necessity and possibility are naturally understood as indicating degree of certainty about a proposition. In (6), for instance, epistemic *must* indicates a high degree of certainty on the part of the speaker about the proposition expressed by *the prisoner has left*. In English, the relevant sense of “epistemic modality” covers expressions such as *certainly*, *probably*, *perhaps*, *maybe*, *it is uncertain*, and *I doubt*, in addition to the epistemic meanings of the modal verbs.

Modality is sometimes also taken to include *evidential* expressions, that is, expressions like English *allegedly*, *reportedly*, *evidently*, *apparently*, and *they say*, which can be described as indicating *source of information*. This sense of modality may be seen as linked to the narrow sense discussed above. It is well known that expressions of necessity may develop evidential extensions. For instance, the German modal verb *sollen* (‘shall’, ‘must’) can be used to indicate that a proposition is based on hearsay evidence, as in (7) (from van der Auwera & Plungian, 1998, p. 85; cf. Traugott, 1989, pp. 41–2 on Old English *sceolde(n)*):

- (7) Es soll ein guter Film sein.
 it should a good film be
 ‘It is said to be a good film.’

Moreover, there seems to be an intimate relation between expressions of source of information and expressions of degree of certainty (see Aikhenvald, 2004, p. 284 on the development of expressions of degree of certainty into expressions of source, and Aikhenvald, 2004, pp. 186–93 on the opposite development). However, the relation between evidentiality and epistemic modality remains contested (see Nuyts, 2006, pp. 10–12 for an overview).

Even broader uses of the term “modality” figure prominently in the literature. In these uses, modality is associated with notions like *speaker attitude*, *subjectivity*, *stance marking*, *nonfactuality*, or *irreality* (see Narrog, 2005 for an overview). In the broadest use, modality covers all expressions that indicate something about the speaker’s attitude or stance toward what s/he describes. For instance, it includes emotive expressions like *regrettably*, *hopefully*, and *I am glad/sad that*, along with epistemic expressions like *certainly*, *probably*, *possibly*, and *perhaps*. However, while broad-sense modality covers some narrow-sense modal meanings—for instance the epistemic necessity meaning of *must* in (6)—it excludes others as nonmodal. As a case in point, consider deontic *must* in (5). With its meaning of “obligation” (or “social necessity”), it is used to describe a situation which is completely beyond the control of the speaker, the reality of which we have no reason to question. The obligation which affects the prisoner relates to the social world rather than the physical world, but the social world is as real as the physical one (just ask the prisoner, who really

wants to stay). Thus, defining modality in terms of speaker attitude, subjectivity, stance marking, irreality, or nonfactuality entails excluding at least some cases of deontic modality (see also Nuyts, 2006, p. 17 on dynamic modality).

Modality is often seen as related to *mood*. Typically, the relation is conceived of as similar to the relation between time and tense. Modality is seen as essentially covering a range of meanings, whereas mood is taken to cover the grammatical coding of those meanings (e.g., Davidsen-Nielsen, 1990, p. 1; cf. Palmer, 1986, p. 7). This view goes with a risk of confusion. Mood is standardly associated with notions like *indicative* and *subjunctive* as well as with illocution-based notions like *declarative*, *imperative*, and *interrogative*. But it is far from obvious that these notions are covered by even remotely narrow conceptions of modality. For instance, there is no reason to doubt that there is a relation between directive speech acts such as commands and the deontic meanings of modal verbs. Deontic modal verbs can be used to issue commands, as in (8):

- (8) Mother to child: You must be home by 10!

However, this is fully compatible with maintaining a distinction between directive speech acts and narrow-sense deontic modality: the reason deontic modal verbs may be used to issue commands is that they describe social relations and that, under the right conditions, social relations can be brought about by describing them. In (8), *must* describes an obligation on the part of the hearer, and only because the source of the obligation is the speaker, and the speaker has powers over the hearer, does *must* “performatively” bring about the obligation it describes (see Sweetser, 1990, pp. 65–8).

As will be clear from the discussion above, there is agreement that modality centres around the notions of necessity and possibility—especially epistemic necessity and epistemic possibility. However, scholars differ quite considerably in what they take modality to cover in addition to these notions. Therefore, use of the term “modality” requires a clear definition of what the term is intended to cover.

Modeling Language for Assessment

ROBERT J. MISLEVY

A model is a simplified description of a more complex system that helps people reason about particular aspects of the system. A model of language for assessment focuses on selected aspects of people's capabilities to use language, the kinds of situations in which these are revealed, and qualities of performance that provide evidence about them. These models guide the practical work of designing tasks, evaluating performances, and producing test scores. They ground claims about the meaning of scores, and provide a framework for validating those claims.

Model-Based Reasoning

The entities and relationships of a model provide a framework for reasoning about real-world situations. The lower left plane in the box in Figure 1, labeled (D), represents a situation. It is mapped into the semantic plane (C) of the model. The analyst reconceives the real-world situation in terms of the model's concepts and relationships (E). Variables in the model can be used to explain observations and make predictions for new situations (F). Some models have symbol systems (A and B) that further support reasoning in the semantic plane of the model.

In language testing, language users act in task situations (D). The semantic plane (C) is an applied linguistics model. It comprises selected aspects of performances and situations, and some aspect(s) of examinees' capabilities—the *construct*. The relationships among these entities are specified mathematically through measurement models (A). Task response variables x represent aspects of examinees' performances, and person variables θ operationalize constructs. (The symbol θ is used here generically to indicate a proficiency variable in classical test theory, item response theory, factor analysis, or some other measurement model, as discussed below.) The measurement models posit probability distributions for responses given examinees' capabilities as expressed in θ . Estimates of θ are used to predict their behavior in target language use (TLU; Bachman & Palmer, 1996) situations (F).

Not all aspects of a real-world situation are represented in a model. Only certain entities and relationships, at certain timescales and levels of analysis, are addressed. A model's validity concerns the aptness of the relationship among the model, reality, a user, and a purpose (Suárez, 2004). Model-based reasoning requires proposing, instantiating, checking, and revising to arrive at a suitable model for the purpose at hand.

In language testing, the applied linguistics model (C) mediates between a rich but incomplete understanding of language use and a relatively simple measurement model (A). The general structure shown in Figure 1 can be implemented through a number of approaches. They are distinguished by relationships among what is observed (D), what is included in the applied linguistics model (C), and TLU situations (F).

Language Use

A contemporary view of language use centers on the patterns through which people interact with one another in socially constructed situations. Patterns at many levels are

involved in every language event. These include the acoustic or graphemic patterns and the lexical, grammatical, semantic, and pragmatic patterns usually associated with language, but also topical knowledge, sociocultural considerations, and the purpose of the activity—all instantiated in the linguistic and situational context in which the event takes place. These can be referred to collectively as linguistic, cultural, and substantive, or L/C/S, patterns (Mislevy & Yin, 2009). Neither static nor rigid, L/C/S patterns are regularities in the varying and ongoing interactions among members of communities (Larsen-Freeman & Cameron, 2008).

The within-person aspect of this view concerns how well and in what kinds of circumstances an individual can perceive situations in the terms of relevant L/C/S patterns, use them to create understandings, and act effectively. Examples include using verb tenses and constructions to form a mental model of “who gave whom what and when,” and recognizing that one has committed a faux pas and apologizing. Together, these interacting extrapersonal and intrapersonal aspects ground an interactionist view of language, a special case of a sociocognitive psychological perspective.

People develop resources for understanding and acting in situations by experiencing particular situations and becoming attuned to regularities: observing how others use them, seeing what actions bring results in which kinds of situations, and extending familiar patterns to new uses. An individual’s resources change with every use of language, usually slightly, sometimes dramatically. Some L/C/S patterns show more variation than others across situations, and people differ in the stability with which they activate resources in response to various situational patterns.

Table 1 Modeling approaches

<i>Approach</i>	<i>Construct definition</i>	<i>Typical assessment types</i>	<i>Example</i>
Trait definition (competency-based assessment)	Person characteristics specified independent of context	Discrete skills assessment; task-based assessment focusing on underlying competencies	Vocabulary size
Behaviorist definition (Norris, Brown, Hudson, & Yoshioka, 1998)	Context characteristics specified; person characteristics not specified	Task-based assessment focusing on outcomes	Quality of vocabulary use when writing in medical contexts
“Minimalist” interactionist definition (Chapelle, 1998)	Person characteristics specified relative to a particular context	Task-based assessment focusing on underlying competencies as they are applied in a context domain	Vocabulary size for writing in medical contexts
“Moderate” interactionist definition (Chalhoub-Deville, 2003)	Characteristics within a person acting in a situation	Task-based assessment focusing on capabilities in a context domain	Aptness of vocabulary use in varying medical contexts (e.g., explain same condition to physician and to patient)
“Strong” interactionist definition	Changing person characteristics when acting in a task situation	Dynamic assessment (Poehner, 2008)	Improvement of vocabulary use in medical contexts

Modeling Approaches

Both assessment tasks and TLU situations engage L/C/S patterns at many levels. Test developers design tasks in order to obtain information about potential performance in TLU situations. For some assessments the targeted TLU situations are well defined and for others they are vague. A modeling approach comprises a construct, features of tasks, the determination of aspects of performance to evaluate (sometimes specified formally in a test framework), and the matchup between features of task and TLU situations. Table 1 summarizes five approaches to modeling language for assessment, using Bachman’s (2007) classification of construct definitions. The vocabulary examples draw on Chapelle (1998).

Trait Definition

Historically the term “construct” has been associated with *traits*, or “relatively stable characteristic[s] of a person—an attribute, enduring process, or disposition—which is consistently manifested to some degree when relevant, despite considerable variation in the range of settings and circumstances” (Messick, 1989, p. 15). Many assessments using a trait-based construct use context-lean tasks (e.g., questions on the gist of recorded

conversations) to predict performance in TLU situations (e.g., a conversation with an instructor, on a particular topic, for a meaningful purpose).

In the terms of Figure 1, the features of task situations (D) are designed to elicit the targeted trait. Performances (also in D) are regarded in the applied linguistics model as depending on examinees' trait values (C). Scores in the measurement model (A) reflect evaluations of performances. Inferred trait values are used to make predictions for TLU situations (F), where the features of situations and the nature of performances can differ substantially from those of tasks.

Discrete points assessment is a familiar example of the trait approach. A vocabulary construct might be defined in terms of the size of a student's store of individual lexical elements, and tested with short definitions of isolated words. Tests labeled as assessments of listening, speaking, reading, or writing reflect a trait approach at a broader level. The approach has been used to test competences such as syntactic competence, cohesion and rhetorical organization, sensitivity to register, and familiarity with figures of speech (Bachman, 1990).

It is an empirical question how well performance in task situations predicts performance in which TLU situations, for which examinee populations, and for what purposes. The outcomes depend on the stabilities and variabilities of examinees' use of resources across the different tasks and TLU situations. The correspondence is lower if important demands in TLU situations are not present in tasks, or if important demands in tasks are not present in TLU situations. These mismatches constitute *construct underrepresentation* and *construct irrelevant sources of variance* (Messick, 1989).

Behaviorist Definition

A *behaviorist* modeling approach defines a construct as an ability to perform certain kinds of tasks (Clark, 1975). Attention focuses on features of tasks and performances (D), which closely reflect valued TLU situations (F). This approach is sometimes called task-based testing, although the construct definitions discussed below can also be used with complex and meaningful tasks. The presumption is that whatever assemblies of resources a student brings to bear in the task situations will be activated in TLU situations.

An example of tasks mirroring TLU situations is preparing written summaries of patients' conditions in medical role play. Performances are evaluated by criteria that constitute or contribute to success in those situations. With regard to vocabulary, does the examinee use terminology that is appropriate for the situation, and use it accurately?

"Minimalist" Interactionist Definition

The sociocognitive perspective sees performance arising from the assembly of resources in the moment, in a context. A *minimalist interactionist* modeling approach maintains the concepts of traits and situations from the two preceding approaches, but attends to the ways that context constrains the linguistic choices a language user can make during performance (Chapelle, 1998). Such constructs are more strongly connected to situations than trait-based constructs, yet more fully explicated in terms of competencies than behaviorally based constructs.

In terms of Figure 1, key features of both situations and performances appear in the model space (C) and are required in both tasks (D) and TLU situations (F). Constructs (also in C) can be phrased in trait terms, but with contextually constrained interpretations. To assess vocabulary, a medical school might present medical passages in the target language and ask for definitions of words in this context. Because the tasks match more L/C/S requirements of the TLU situations than a generic vocabulary test, stronger prediction is anticipated.

“Moderate” Interactionist Definition

A *moderate interactionist* approach embraces the view of language capability as sets of flexible evolving resources and of language performances as highly contextualized events. The capabilities of interest concern adapting resources to situations. Features of situations are examined for their requirements and their matchups with TLUs. Performances are evaluated with respect to successful action. Use of medical terminology in role-playing contexts would now require vocabulary to be tailored to different conversational partners, such as patients and other medical professionals. The construct is not simply “vocabulary knowledge,” or even “vocabulary knowledge for medical situations,” but the capability to adapt and apply lexical forms in inherently context-dependent ways.

Under this approach to construct definition, the meaning of θ s is local and contingent. Strong justification is required to extrapolate beyond task situations. Inference from context-lean, large-scale assessments demands caution. Assessments are preferred that match task and TLU features, contexts, and activities as closely as feasible (Douglas, 2000), and capitalize on examinees’ resources with regard to L/C/S patterns that are not the target of inference (Swain’s, 1985, admonition to “bias for the best”).

“Strong” Interactionist Definition

A *strong interactionist* definition of constructs emphasizes the adaptation of learners’ capabilities through specific uses of language. Features of task situations (D) are designed to evoke resources with respect to particular L/C/S demands, anticipating that learners performing suboptimally can be guided to learning situations (F) that develop the targeted resources. Constructs defined here are amenable to change.

This approach is seen in diagnostic testing and dynamic testing. Diagnostic tests separate assessment and learning events, presuming that the targeted capabilities are relatively stable during assessment but that subsequent learning situations can be tailored to develop resources in identified areas. Tasks in dynamic assessment provoke change during assessment (Poehner, 2008). This approach is employed, often informally, in intelligent tutoring systems (ITSs) and in simulation-based and game-based assessments. Dynamic vocabulary assessment in the medical context could seed key terms into the role play, and shape the interaction to extend the student’s capabilities with those she or he is less familiar with.

Measurement Models

Measurement models address patterns in responses across examinees and tasks. To the extent that a model fits a given data set, it is because of stabilities and similarities in individuals’ use of resources to act in those kinds of task situations. This section highlights aspects of measurement models that are pertinent to the applied linguistics models they are meant to support.

The Probability Framework

A measurement model gives probability distributions for observations as functions of variables for examinees and situations. A measurement model contains unobservable variables θ that characterize aspects of proficiency that correspond to the construct(s), and scores x_j that represent aspects of performance in situations indexed by j , either test scores or item scores, depending on the measurement model being used. Conditional distributions $p(x_j|\theta, \beta_{jj})$ describe the central tendency and typical variability of performance in that situation, given a learner’s capabilities as they are characterized in the model and parameters β_{jj} that may further be modeled in terms of task or test features.

The specific forms of θ s and x s (e.g., univariate or multivariate, discrete or continuous) and structures of the $p(x_j|\theta, \beta_{jj})$ s provide a framework at level (A) in Figure 1 for reasoning quantitatively about the entities in the applied measurement model in level (C). The measurement model grounds inferences about an examinee's θ given her or his responses. The operational meaning of θ is a characterization of performance tendencies in task situations.

Broadly speaking, reliability is the degree to which estimates of θ from observations in task situations (D) predict performance in similar task situations (constrained cases of F). Concurrent and predictive validity correspond to projections to TLU situations (criterion situations as in F).

Commonly Used Models

The most commonly used measurement model is *classical test theory* (CTT), in which θ is an overall proficiency with respect to the kinds of tasks and performances in the test. Total score approximates an examinee's true score θ . A standard error of measurement indicates the strength of evidence for an individual, and reliability gauges evidence for distinguishing members in a population. For tests where data are ratings of performance, generalizability theory (g-theory; Brennan, 2001) extends CTT to issues of variability and bias entailed by raters and rater characteristics, task and rubric designs, and assessment and scoring configurations. The CTT formulation corresponds directly to inferences about capabilities cast in terms of trait and behavioral constructs. CTT can be also used with interactionist definitions of constructs, but the interpretation θ is then conditioned on testing populations, circumstances of observation, and task features.

A shortcoming of CTT is that students can obtain similar scores using different sets of resources in different ways, which may subvert making the same predictions, instructional prescriptions, or interpretations of performance for them. By addressing performance at the level of tasks, *item response theory* (IRT) measurement models can identify tasks and persons whose response patterns differ sufficiently from typical patterns to question the model-based reconception of test performance. This capability can be used to highlight atypical individuals, tasks, and performances, and detect large-scale patterns such as different task difficulties for different first language (L1) examinees (McNamara & Roever, 2006). To the degree that it fits data in a given context, IRT enables inference about likely performance on individual items and estimation of θ s from different sets of items, as in computerized adaptive testing (Wainer, 2000).

Structured, multivariate, mixture, and rater-effect measurement models are recent extensions of these ideas. Each extends the space of applied linguistic models that can be supported with a measurement model, and each adds capabilities that accord with an interactionist perspective. *Structured* IRT models (De Boeck & Wilson, 2004) and diagnostic classification models (Lee & Sawaki, 2009) incorporate into the probability framework those features of tasks that are central to the L/C/S patterns of interest. They guide task development and help check that response patterns accord with the simplified applied linguistics model. *Multivariate* versions of these models are particularly useful for complex tasks, where capabilities with different L/C/S models are involved to different extents in different tasks, in ways that can be linked to task features. These models can be applied with any of the approaches, with θ s, x s, and task features suitably defined. *Mixtures* of IRT models (Von Davier & Carstensen, 2007) suit situations in which, by virtue of characteristically different approaches or learning histories, response patterns in distinct classes of examinees can be approximated by corresponding IRT models. *Rater-effect* IRT models such as the many-faceted Rasch model (Linacre, Engelhard, Tatum, & Myford, 1994) incorporate rater effects used widely in language testing (McNamara & Roever, 2006).

Factor analysis and *structural equations modeling* (SEM; Kunnan, 1998) are used to study relationships among scores from multiple tests, and as such can be used with scores formed in any of the approaches discussed above. They are employed in construct validation studies and theory development. Patterns of scores from task-centered tests can be analyzed in terms of shared traits, for example (e.g., Sasaki, 1993).

Current Issues and Future Directions

Articulation Between the Sociocognitive and Measurement Perspectives

Measurement models provide the formal machinery (layer A in Figure 1) necessary to make and support claims about score meaning. Because they evolved under trait and behavioral psychology, the terminology in which they are cast articulates poorly with a sociocognitive view of language. Providing a crosswalk between the two paradigms will help in both designing language tests from interactionist perspectives and properly constraining inference from tests cast in trait-defined and behaviorally defined approaches.

Proficiency Frameworks

Assessment frameworks were noted above as specifying the choices about constructs, task features, and performances that operationally define an assessment. The use of frameworks for particular assessments is uncontroversial, but a current issue in modeling language concerns broadly cast frameworks that describe capabilities at increasing levels of proficiency. Two examples are the American Council for the Teaching of Foreign Languages guidelines for reading, writing, speaking, and listening (e.g., Breiner-Sanders, Swender, & Terry, 2001) and the Common European Framework of Reference (CEFR) for Languages (Council of Europe, 2001). Descriptors of what a learner at CEFR level B2 can do include “construct a chain of reasoned argument” and “explain a viewpoint on a topical issue giving the advantages and disadvantages of various options.” Operationalizing these descriptors in tasks requires many specific design choices about capabilities, contexts, topics, testing methods, performance modes, and evaluation procedures, all of which affect the difficulty of tasks and the L/C/S demands that are evoked. Simply designing tasks to descriptors or matching pre-existing tasks to the framework does not ensure validity, and a learner performing at, say, level B2 in one assessment can perform markedly higher or lower on another assessment nominally linked to the same framework.

Assessment Engineering

An active line of research is making the assumptions, principles, and argument structures that underlie assessment explicit, so that tools and processes can be developed to make assessment design more efficient and more consistent in quality (e.g., Mislevy, Steinberg, & Almond, 2002; Luecht, 2003). This work coordinates the domains of expertise that must come together in assessment, including cognitive research, measurement models, task design, and performance evaluation (e.g., for automated scoring). Bachman and Palmer (2010) discuss the interplay between modeling language for assessment and assessment design for practical applications in terms of assessment use arguments. Chapelle, Enright, and Jamieson (2008) provide a comprehensive example for the teaching of English as a foreign language (TOEFL) redesign.

Models of Interpreting

ROBIN SETTON

Introduction

Interpreting is a complex and unique activity whose social, cognitive, and linguistic features are not captured in any existing discipline. The models so far proposed have emphasized either its relational aspects, as a social communication service, or its individual performance as a complex cognitive and linguistic operation, and have accordingly drawn on different disciplines in the humanities and cognitive sciences. Such models have been based on a mixture of intuition from personal experience, imported theory, and inference from experiments, performance data, surveys or interviews, and, to some extent, neuroimaging.

Any such model reflects the state of the art in its feeder disciplines and their current paradigms, and the robustness of the available evidence. Interpreting data is complex, elusive, and characterized by wide intersubject variability on all variables; usable authentic samples for observational research are hard to collect; and ecological validity and experimental design issues make such evidence hard to interpret. However, while models of interpreting may be more tentative, as descriptions of reality, than models of simpler phenomena in the background disciplines, they serve as intermediate research tools, and some have been very successful as heuristic pedagogical aids—more so, perhaps, than as explicit computational blueprints for machine interpretation.

Models of interpreting fall into two broad categories. Relational models try to capture the pattern of interactions in interpreted events, from a single interview to an entire conference, while cognitive process models focus on the mental activity of the individual interpreter.

Sources and Components

Models of interpreting have drawn more on sociology, cognitive psychology (psycholinguistics), and information theory than on translation studies or linguistics. Translation studies traditionally focused on product rather than process, and the descriptive linguistics revolution of the 1960s and 1970s has had no visible impact, as if the linguistics of form were not close enough to psychological reality to illuminate interpreting; but some models have drawn on the functionalist tradition, discourse analysis techniques (e.g., Wadensjö, 1998), or pragmatic theory (Setton, 1999).

Cognitive science has been tapped for components to model the internal processes of interpreting, including speech processing, memory, and attention/resource allocation and coordination. How these mental components and functions interact in the specific configuration of interpreting is a central problem in cognitive process models.

“External” or Relational Models

Relational models focus on the social and behavioral determinants of the activity, embedding interpreting within a broader framework, such as human social communication, or

even a general theory of action. This approach, prominent in German-speaking countries, draws on the functionalist and text-linguistic schools of European translation studies and highlights the sociocultural context of the interaction and the purposeful (or *skopos*-oriented) nature of translation (Kirchhoff, 1976; Pöchhacker, 1994; Salevsky, 1994; Kalina, 1998). Stenzl's "communicative information flow" model (1983, p. 45) contrasts the communicative *intention* of the sender, the communicative *function* for the receiver, and the different contexts in which each formulates his message: the speaker against his own sociocultural and situational background, the interpreter drawing on her own situational and textual knowledge, and both presupposing some knowledge and background in the receiver(s). Pöchhacker's "interactant model" (1994), drawing on *skopos* theory, attempts to link the cognitive and social levels by placing the interpreter within a wider "situated activity system" of concentric circles, and relating each "text" to the "hypertext" (the entire interpreted conference) and the wider social context, including the interpreter-client relationship.

Such relational models also draw attention to the interpreter's role, which is not always straightforward, especially in the less conventionalized and more often face-to-face settings and configurations of community, public-service, legal, or media interpreting (Pöchhacker, 2000; Chiaro, 2002). Alexieva (1997/2002, p. 230) lists parameters on which an interpreter's role can vary in different situations: distance versus proximity (between speakers, addressees, and interpreters), interactants' relative status ("power gradients"), formality of setting and conventions (turn taking, rules of order), cooperativeness or initiative for negotiation, and whether interactants' goals coincide or conflict (as in the adversarial context of legal proceedings). The interpreter will thus interact and behave differently, or be expected to, in a medical or police interview between an uneducated or illiterate person and a doctor, lawyer, or judge; in an adversarial encounter between witnesses, defendants, and counsel in a courtroom; or in an international conference. As Wadensjö (1998) shows in a corpus from public-service interpreting (police interviews), using Goffman's notion of "footing," the interpreter's role may even vary, during a single interaction, between that of *reporter* (expected only to repeat what is said), that of *recapitulator* (expected to give an authorized voice to the speaker), and that of *responder* (when the interpreter is invited to make her own contribution to the discourse).

"Internal" or Cognitive Process Models

Conference interpreting, whether "full" consecutive with notes or simultaneous (SI, sometimes with accompanying text or slides), is performed in more formal settings. The interpreter's role is standardized, with little or no advocacy, explanation, or summary; the emphasis is on speed, accuracy, and formal register. Accordingly, models of conference interpreting, especially SI, tend to focus on cognitive processes.

Any plausible cognitive model of interpreting must take into account both evidence from professional performance (transcripts, recordings, or consecutive notes) and state-of-the-art findings in cognitive science, on memory, attention, bilingual neurolinguistic organization or processing capacity, extrapolated as far as possible to the interpreting task. Interpreters must transfer a discourse between two languages that conceive and express things differently, under severe time constraints. These two facets of the task—reformulation and cognitive management—are highlighted in the two best known models of conference interpreting, one of which focuses on the translation process, the other on cognitive load.

The Interpretive Theory of Translation (ITT)

The interpretive theory of translation (ITT), also known as the "théorie du sens," was developed through the experience of interpreter training at the Ecole supérieure d'interprètes

et de traducteurs (ESIT, Université de Paris XI) as well as analyses of professional performances, and contains an inbuilt prescriptive dimension. In consecutive interpreting, Seleskovitch (1975) found wide individual variation in what interpreters note and how, and a loose and variable correspondence between the words uttered by the speaker, the notes, and the phrasing of the renditions, except for a few identifiable equivalent terms. From this she inferred that most of the speech is processed cognitively, not verbally, the notes serving only as reminders. In good translation and interpreting, this conceptual route must be dominant, with “transcoding” used only as an occasional fallback for frozen items like technical terms, names, numbers, or lists. This is famously illustrated in the “currant bun” analogy: After cooking (i.e., interpretation), only a few items—the currants—are “physically” recognizable, while the dough or bulk of the discourse is “chemically” transformed into a totally new linguistic form. The sense, or speaker’s intended meaning, is said to crystallize in the interpreter’s mind as the speech is understood in context, and is then formulated, in effect, as the interpreter’s own thoughts, the main effort being to resist linguistic interference.

These two processes, interpreting proper versus “transcoding,” are ascribed to two different memories: “Sense” forms in cognitive memory, forgetting the original words (“deverbalization”), while the occasional items that cannot or need not be processed cognitively must be literally noted, or quickly translated, before they fade from the much briefer echoic memory. Lederer (1981) models SI as an interplay of eight overlapping, continuous or occasional, operations. The central activity is conceptualization, or “the construction of a cognitive memory by the integration of successive fragments of the speech string with previous knowledge.” This overlaps with hearing, linguistic comprehension, and enunciation, with occasional “transcoding” of fixed terms (or of the first few words of a new utterance before the speaker’s meaning is clear), and conscious lexical retrieval. Finally, “awareness of the situation,” and self-monitoring, must be continuous (Lederer, 1981, p. 50). The alternation between the two kinds of processing—conceptualization and transcoding—is said to explain the restructuring observed in SI and variations in the lag (or “ear–voice span,” EVS) as the interpreter either falls behind while analyzing or waiting for more context to understand an idea, or, conversely, must catch up quickly to transcode a more ephemeral item. The theory has been further glossed and developed by various authors (e.g., Laplace, 1994) and is widely used in interpreter and translator training (Seleskovitch & Lederer, 1989/2002).

The Effort Models

The effort models (Gile, 1995/2009, 1997) explain variations in interpreting performance directly in terms of the fluctuating demand on processing capacity. Observing that even experienced professionals make errors for no obvious external reason (such as fast input, lexical difficulty, or poor acoustics), Gile identifies four “non-automatic” processes—listening/analysis (L), memory (M), production (P), and coordination (C)—as sufficiently distinct to postulate a “zero-sum” model of the competitive allocation of effort between them, bearing in mind that capacity requirements vary enormously through the discourse, and that L, M, and P are always working on different segments. Problems can arise when either the overall capacity or the specific capacity needed for one of these efforts is exceeded. According to Gile’s “tightrope hypothesis,” interpreters—especially in SI—are working near saturation much of the time, so that even slight destabilization may trigger failure and knock-on effects (failure sequences) at some distance downstream from the initial point of overload. “Problem triggers” which may cause overload immediately or downstream include peaks of high information density, fast delivery, enumerations or lists, poor sound, short or non-redundant stimuli like numbers, names, and acronyms, and syntactic asymmetries between source and target languages (1997, pp. 205–8). Conversely,

capacity is relieved when demands on attention are low, for instance at pauses and when sentence endings are predictable (Gile, 1992).

The difference in emphasis between ITT and the effort models is illustrated in their account of the key resources needed to render an item like *surface diamond drilling program* (Lederer, 1990) into French in SI: Gile stresses the scanning, reordering, and retrieval processes this entails, Lederer the external knowledge needed to render it into French with the correct (mandatory) prepositions as *programme de forage au diamant en surface* ('program of drilling with diamond on surface').

Discourse-Oriented Models

Chernov's "probability prediction model" of SI (Chernov, 2004) focuses on the role of information density and "newness" versus redundancy and predictability. Chernov explains the feasibility of SI by the key property of *redundancy*, which makes discourse more predictable as it unfolds, and facilitates anticipation. Citing evolutionary theory, Chernov observes that our perception is attuned to transitions rather than steady states, hence to new information, which in discourse is usually carried in the "rheme," while the more redundant "theme" offers opportunities for compression. In addition to the "objective" redundancy inherent in language at different levels, "subjective" redundancy for a given listener increases with existing knowledge and inferencing during comprehension. The combined effect of redundancy and attunement to new information is to enhance predictability. Chernov's model notably explains why SI does not lend itself to particularly dense communications like poetry, legal documents, or numerical information. His experiments with unexpected sentence endings and continuations (Chernov, 1992) showed that interpreters do make and rely on anticipatory syntheses, corroborating the role of anticipation (and the dangers of "cognitive prejudice").

Information Processing and Human Communication

Shannon and Weaver (1949) modeled communication between cognitive devices as a single-channel, limited-capacity (noise-sensitive) information-processing system. This paradigm remained influential through the 1970s and early 1980s, inspiring flowchart-type models of SI as a speech-processing task, a problem-solving task, or both, with decision points, memory buffers, and feedback loops (e.g., Gerver, 1976; Moser, 1978), while the effort models, as we have seen, highlight capacity limitations. Linguistic aspects are recognized by these modelers (e.g., in Gile's "gravitational model" of lexical availability; Gile, 1995/2009), but do not fit easily into the paradigm, still less the role of relevant knowledge and context, leading some modelers to look for support in recent cognitive science for more pragmatic, top-down processing. It has been suggested in particular that

- memory must use different formats (visual and conceptual as well as verbal) and be highly flexible. Miller (1956) found the capacity of human short-term memory to be "7 plus or minus 2" items, or chunks, but saw that "chunks" could be expanded with additional knowledge;
- parallel processing must be possible;
- attention could be distributed among different, more or less automatized processes with increased expertise. Gerver (1976) recognized that the single-channel hypothesis—"that attention can be paid to only one activity at a time"—must be too rigid; monitoring, for example, would require a secondary channel which is attenuated and analyzed along with primary channel information;
- context, background knowledge, and pragmatics must allow substantial shortcuts in both comprehension and production, as seen in the observed phenomena of prediction or anticipation (Gerver, 1976, pp. 197–8; Lederer, 1981; Setton, 1999; Chernov, 2004);

- a realistic model must allow for individual strategic choices (Gerver, 1976, pp. 191–4; Gile, 2001);
- with increasing expertise, interpreters should find effort trade-offs by using internalized domain-specific procedures and cognitive and linguistic schemas (Shreve & Diamond, 1997; Liu, Schallert, & Carroll, 2004).

In a cognitive-pragmatic model that seeks to reconcile cognitive and communicative aspects, Setton (1999) draws on relevance theory (Sperber & Wilson, 1986/1995) and synchronized transcript analysis to describe interpreting as a process in which linguistic decoding constantly interacts with inference from multiple inputs, including previous knowledge and rich pragmatic clues in the discourse. This generates a continuously updated mental discourse model of the speaker's communicative intent, against which the interpreter must reformulate successive segments to meet target language (TL) constraints, including TL-specific pragmatic packaging. Knowledge schemas and a "bilingual phrasebook," built up with expertise, can relieve working memory, freeing up attention for: (a) monitoring output quality; (b) dealing with more difficult or anomalous input (accents, speed, monotonous delivery); and (c) making strategic or diplomatic judgments (compression, omission, explication, or cultural or face-saving adjustments). In this model, problems arise when the process is forced back onto low-level, "bottom-up" operations with a high cost in attention and coordination, like deciphering, parsing, or effortful lexical retrieval. This may occur in novice performance (insufficient cognitive and linguistic resources), or in difficult conditions (e.g., dense recited speech, or no preparation). Experts working with rich input in good conditions can achieve adequate accuracy and fluency, subject to professional skills, including vigilance against "cognitive prejudice" and linguistic interference from cognates, and, in SI, acquired techniques (like "chunking" or "stalling") to avoid or compensate for the temporary distortions and dilutions that result from having to start formulating in mid-utterance (Setton, 1998, 1999).

Computational and Artificial Intelligence (AI) Approaches

Machine interpretation is an old dream that is still well short of realization, despite successive waves of funding and optimistic prognoses since the 1950s. Ironically, this project has led modelers back from the pre-1980 serial, flowchart-like models to the brain: Models of mental behavior have been implemented in ever more flexible, parallel, distributed—in short, brain-like—architectures.

One example will illustrate the challenges in designing and implementing an operational real-time, real-speech translating system even for a limited, domain-specific application. Kitano's speech-to-speech translation system DMDIALOG (1993) aimed to translate simple telephone dialogues for ordering or inquiry (tourist information) applications. Kitano identifies the main challenges as acoustic variation (the system must recognize and process speech from any speaker of the input language); fast, continuous speech; elliptical reference; ill-formed or truncated grammar (e.g., *Well I . . . oh I think you are right*); indirect speech acts (e.g., *Can you pass the salt?*); and "mixed-initiative discourse"—the interactive construction of dialogue by multiple speakers with progressively less explicit references.

These challenges mandate certain clear options from the design stage. First, the system needs an *interlingua* ("language-independent representation of meaning") rather than a *transfer* approach, though it also uses a large lexical database. Second, to achieve real-time speed, processes must operate in parallel at several levels, for example, word recognition overgenerates possibilities unless constrained by a probabilistic, predictive system. Finally (as seen in real SI), the system must work on current input while producing the previous segment. These specifications require a hybrid of two systems working in "massively

parallel" processing: A symbolic component performing bottom-up and rule-based operations, like sentence parsing, works alongside a connectionist network that is trained to process the discourse top-down and probabilistically against a database of past, similar input sentences and stock phrases (case-based pattern matching). Here again we see the contrast between the "lexical equivalents" and "original formulation" approaches to translation (although here the latter is at best just syntactic generation). The computer's answer is hybrid processing: Translations are produced by generating sentence fragments from parsed cues and inserting equivalent words and phrases retrieved from the database when certain set phrases are recognized.

Strategies and the Expert/Novice Paradigm

Human interpreting must involve a dimension of strategy, or choice, which is not captured in AI or some of the early psycholinguistic models (Gile, 2001), and which complicates the analysis of performance data: In transcripts, predictable language-processing operations may be scrambled and obscured by strategic and expertise effects. Wide individual variability makes such expertise effects well-nigh impossible to model closely, but we have some evidence of the general trend: Experts' output is more "restructured" and shows evidence of processing in larger chunks (Moser-Mercer, Frauenfelder, Casado, & Künzli, 2000). In McWhinney's (1997) connectionist model, skill acquisition is driven both by errors, which prompt interpreters to pay closer attention to minor cues and possible traps, expand their L2 vocabulary, and organize higher-level discourse structures, and by successes, with successful strategies recorded for future use.

Discussion and Evaluation

In spite of the different emphasis of computational information-processing models and more discourse-oriented accounts, existing models have more in common than may appear at first sight. For instance, most authors acknowledge the need for some sort of intermediate alinguistic (or "prelinguistic") stage between comprehension and formulation. There is still plenty of unknown territory, and complex variations on interpreting that involve mixed-modality input, such as sight-translation, SI with text or accompanying slides, or SI through relay, have yet to be modeled (but see Shreve & Diamond, 1997; Shreve, Lacruz, & Angelone, 2010). The roles of nonverbal channels and affect have also been neglected (Poyatos, 1997).

In human cognitive modeling, inference from observation or experimentation is difficult because the enterprise is reflexive: The mind is both the object and the instrument of inquiry. Evidence from psycholinguistics may set bounds on the feasible, in terms of input speed or memory for words or facts, but we cannot extrapolate from performance in artificial laboratory tasks to situated, purposeful interpreting, which allows considerable latitude for strategy and adaptation to a unique context. Some models rely on inference from real interpreting corpora recorded in "ecologically valid" conditions, with appeals to linguistics or other theories of speech communication; some combine corpus analysis and abstract psycholinguistic modeling. So far, however, no global process model has been built *primarily* on findings from controlled experiments. AI models face the more rigorous test of conversion into an operational algorithm and implementation in an artificial system, but have different constraints and flexibilities from the evolved brain.

In summary, a reliable detailed model of the cognitive process of interpreting is not yet within reach. As elsewhere in the humanities, models of interpreting are still not explicit or exact enough to be falsified, even if their source data could be exactly replicated.

Contradictory models will therefore coexist, their relative influence depending on such factors as neatness, persuasiveness, exposure, or, more importantly, their applicability in teaching or research. A teaching model, for example, should show critical or vulnerable points for performance that can be highlighted and targeted by special exercises. Such heuristic models are valuable if they can help trainees learn to use context, weigh up strategic choices against the constraints of time and coordination, or assess the feasibility or difficulty of providing quality in different conditions, or the complexities of the interpreter's role. As research tools, models of interpreting must aim for an account that links the dimensions of cognition, linguistic ability, and task-specific expertise, and the diversity of interpreting environments.

Modularity in Second Language Acquisition

MICHAEL SHARWOOD SMITH

Modules, in any branch of science and engineering, will be defined as units that have a special function. They are expert subsystems delivering their unique contribution in the service of a larger system. Modularity has to do with efficiency. In the industrial revolution of the 19th century, jobs were created which involved people specializing in one thing alone and hence learning to do it swiftly and skillfully before passing on the product to the next specialist. The classic image of this particular type of cooperative activity involves a line of people working at a conveyor belt, each focused on one small aspect of the manufacture of a car, a procedure introduced by Henry Ford in the early years of the 20th century.

Most people would accept that biology operates along modular principles. The human body is composed of various organs—the liver, the kidney, the heart, etc.—with unique functions, each of which has its own special role in supporting the organism. The physical brain has a modular architecture since we know that specific areas can be related to specific functions, even though this may not necessarily mean that these functions are carried out in one brain area alone. For example, visual stimuli and auditory stimuli are handled differently and each have their specific areas and pathways across various regions of the brain—and so, it seems, does language. However, when in theoretical linguistics or in second language acquisition (SLA) circles one talks about modularity, it is not these basic anatomical and physiological functions that are the main issue but rather cognitive function. It has to do with how the mind deals with sensory input and carries out the higher mental functions associated with language use such as reflecting, planning, constructing, and interpreting messages, and also how this ability develops during the language user's lifetime.

In principle, the mind could organize and coordinate the activity of all the various physical expert systems of the body, including the brain, while itself remaining unitary in character: the mind would then be rather like a composer or conductor determining the activities of the various different sections of an orchestra. There are indeed schools of thought in psychology that see language use and language acquisition as the product of the same generic mechanisms that handle all mental activity. Others make a special case for language and argue not only that the mind is composed, from birth, of various expert systems but also that language ability, or more specifically grammatical ability, is one of those systems. This is often referred to as the language “faculty” or the language “module.” In other words, the argument goes that grammatical knowledge cannot be just one example of knowledge in general but must be different in important respects (Chomsky, 1965). The unique human ability to create mental grammars involves the young child developing a kind of knowledge the complexity of which is often greatly underestimated. It is acquired very much earlier than other types of complex knowledge and the process is accompanied by relatively few grammatical errors considering all the logical possibilities that could be entertained given the evidence that children get from the language to which they are exposed. It is also important to note that first language acquisition is accomplished without anyone regularly correcting the grammatical errors that are made (Chomsky, 1965; Hornstein & Lightfoot, 1981). This “logical problem of language acquisition” may be solved,

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0772

so it is claimed, by imputing to the child some inborn ability to create a mental grammar without reflection and without the provision of sufficient evidence to indicate clearly what is permitted in the grammar and what is not. The conclusion is, therefore, that there exists some sort of specialized knowledge base, one that has evolved in human beings and that guides and restricts the way in which a very young child creates complex grammars from the language utterances it is exposed to. This knowledge base, which Chomsky called universal grammar (UG), is not a grammar in itself but more a set of grammar building principles. Only much later, when the children are more mature, know more about the world, and are undergoing education of some sort can they start to acquire other kinds of knowledge; even then, crucially, they need to know whenever they have arrived at an incorrect hypothesis about what they are trying to learn. In other words, they need correction. While this view of the language faculty has a great deal of support, there are, as suggested earlier, those who deny that the evidence points to the existence of an innate capacity for language, and offer other more parsimonious solutions, for example the emergentist proposals of O'Grady (2003) and the more radical views of MacWhinney (1987), Bates and MacWhinney (1988), and Ellis (2003).

In second language acquisition, the big question amongst those who accept the above-mentioned arguments for an innate human language faculty is whether UG, the specialized knowledge base referred to, operates just once. That is to say, is it designed to provide the human child with a language, or, in the case of multilinguals, with more than one language, after which its job is done? Alternatively, is it available in some form for learning new languages later in life? If the former is true, then older language learners would have to fall back on more general learning mechanisms developed at school. This would have a number of important consequences. For example, second-language learners would develop grammars that were not constrained by the principles of UG and might therefore contain rules or principles not instantiated in children's or indeed older native speakers' mother-tongue utterances. For instance, if, according to UG-based research, it turned out that a grammar of any human language must either, like Japanese, require relative clauses to *precede* the head noun (as in "ate small bones dogs") or, alternatively, like English, to *follow* the head noun (as in "dogs who ate small bones") but definitely not both, then second language (L2) learners might indeed violate this UG principle and develop an "unnatural" grammar permitting *both* options. An English learner of Japanese, for example, might acquire the Japanese relative-clauses-first option while not giving up the English alternative and so produce a kind of hybrid form of Japanese that allowed both these two word orders. All the while these two conflicting orders manifested themselves in this learner's performance in Japanese, it could be said that the underlying learner grammar in question was an impossible one, that is, illicit in terms of UG principles and therefore to be labeled as "non-natural." Unlike this hypothetical second language learner, a small child acquiring English or Japanese as a mother tongue (or indeed both English and Japanese at the same time) would never end up with this hybrid solution of allowing relative clause to come either before or after the head noun. If, in the bilingual child, both orders ever manifested themselves in performance, that is, in one or other of the two languages, the expectation would be that this would be a strictly temporary diversion: it would not persist and would speedily give way to the appropriate, native option when speaking either language. Furthermore, second language learners, once they have illicitly adopted both word orders, would have to rely on systematic correction of some kind to stop doing this since there is no guarantee that exposure to the target language will provide sufficient and appropriate evidence that will correct all their various incorrect assumptions about the target grammar.

Right from the start, SLA theory reflects the tension between these two opposing points of view on modularity and language. Early on, Selinker (1972) suggested that the evidence that older learners did not learn in the same way as younger ones was overwhelming:

second language learners are almost always non-native to some degree. Put another way, it indicated to him that the language faculty, once it had served its purpose in the creation of a mother-tongue system, ceases to be available. This was the basis for his interlanguage theory, which was based on the assumption that psychological explanations of how L2 "input," that is, the L2 utterances a learner is exposed to, required a special type of psychological explanation. This later came to be known as the incompleteness or fundamental difference hypothesis (Schachter, 1988; Bley-Vroman, 1990). The principles of UG would only manifest themselves where L2 learners (subconsciously) transferred grammatical features of their first language into the developing L2 grammar, that is, any subsequent language they are exposed to. Even then they might end up with the kind of illicit hybrid solution exemplified above. In other words, the modularity hypothesis would hold for first language acquisition but not for second language learning carried out after the first one has been acquired. This therefore implies some version of the critical period hypothesis, which holds that our natural language learning ability, that is, UG-based development, has to take place within a given, early period in life after which it disappears (Selinker, 1972; Birdsong, 1992). That is to say, we do not lose, to use Pinker's term, "the language instinct" (1994) by virtue of acquiring a native language, or more than one native language simultaneously: this instinct is simply no longer available once we have reached a particular age, originally assumed to be around puberty (Lenneberg, 1967). Supporting evidence both for the existence of a language module as also for its failure to deliver native ability in later life may be found in Smith and Tsimpli's work on the remarkable savant Christopher who, though severely brain-damaged and mentally incapacitated, acquired native English in the normal manner. In addition he has displayed a really exceptional gift for picking up a large number of second languages although, significantly, despite his great fluency in a number of these, he has not shown the full grammatical competence that would have been guaranteed if the process had been constrained by the principles of UG (Smith and Tsimpli, 1995).

The opposing school of thought in SLA came to the fore in the proposals of Dulay, Burt, and Krashen, who saw evidence of a fixed order in which functional grammatical morphemes, such as the articles and regular and irregular past tense forms, are acquired by second language learners, as manifested in their own experiments on second language learners from varying language backgrounds, noting that this order was substantially similar to the fixed developmental sequence noted in first language acquisition (Brown, 1973; Dulay, Burt, & Krashen, 1982). This fixed order, and especially the apparent lack of influence on it from learners' mother tongues, indicated to them that the language module was still functioning in adults. This meant that, in principle at least, older language learners had the potential to attain the same level of grammatical knowledge as the young child. The varying success of older learners to reach native levels in a second language would therefore have to be ascribed to other inhibiting factors. Krashen further asserted that the separate type of language knowledge that arose from conscious processes, typically developed during formal instruction, could play no positive, effective role in the development of the subconscious grammar. It was useful only to a limited degree in boosting correctness during actual learner performance since, to use such knowledge, a language user needed extra time, and also a deliberate focus on the formal properties of what they were saying or writing plus the actual inclination to use it (Krashen, 1985).

These two opposing views on the language module in SLA, first voiced in the 1970s, have been reiterated through to the present. In the main, this has been between people who all subscribe to the Chomskian notion of a language module as an abstract set of principles controlling the construction of mental grammars. There are, however, two other conceptualizations of the language module which have played a role in the research literature. One has been around since the 1980s, namely Jerry Fodor's processing-based

view of modularity (Fodor, 1983). The other one, Ray Jackendoff's, entered the debate in the SLA literature only at the close of the 1990s (Jackendoff, 1997; Carroll, 1999).

Fodor's views on the modularity of mind, unlike those of Chomsky who was interested only in abstract principles constraining grammatical knowledge, was cast in processing terms. Fodor makes a distinction between central processes, concerned with belief fixation, and peripheral input systems, which are modular. The input systems, one of which is the language module, process signals originating in the environment. This information is then delivered to the central processes in a form that they can use. The modules are innately specified. The information handled by each module is encapsulated—in other words, the module deals only with very limited information coming to it. Because the information processed by a module is sealed off in this way, it is not affected by any other information and thus works rapidly and efficiently. Also, each module has its own unique encoding system so that its representations cannot be read by other processors. Finally, modular processing is mandatory. Thus, if your eyes and ears are not blocked off in some way, you cannot refuse to see anything presented in your visual field nor can you refuse to process language utterances you are exposed to. Although these two proponents of modularity in language were very different in what they were purporting to explain, Schwartz, recasting Krashen's views within a generative linguistic framework, saw the two approaches, Chomsky's and Fodor's, as largely compatible (Schwartz, 1986; c.f. Carroll, 2000, pp. 260–87). Krashen's conscious learning could be seen as the product of Fodor's central processes, that is, non-modular. As such the resulting knowledge representations would be different in kind from those in the L1 or L2 (subconscious) grammars. The second language learner, in this view, ends up with two different types of grammatical knowledge. One type is processed by, and develops within, an encapsulated Fodorian language module within the constraints imposed by UG: Chomskian principles would dictate the possible shapes the L2 grammar would take. On the other hand, consciously learned grammatical knowledge would be inferred via Fodor's central processes. Albeit under certain very limited conditions, the resulting "extramodular" knowledge could be used, again consciously, to check and patch up output, "faking," as it were, a more advanced mastery of the language. However, it could not affect the shape of the emerging modular grammar. This would show up most transparently in spontaneous language use where the learners were not able to reflect on the grammatical accuracy of what they were saying. For both Krashen and Schwartz, second language learners are capable of developing the same kind of grammatical systems as children are. The availability of this second type of grammar learning, coming later on in life, is a mixed blessing. On the one hand, it can be used to improve performance in certain circumstances, but on the other hand, concentrating on developing conscious knowledge of grammar might be a stumbling block inhibiting subconscious acquisition from proceeding in its own good time. Those who maintain that the language module is operating in later life may have different views on how it works but are all of the opinion that the lack of success experienced by many second language learners should be ascribed to other factors. This is different from the first approach, which sees all L2 learning proceeding without the benefit of the language instinct.

In the more recent SLA literature, there has been a growing interest in Jackendoff's views on human linguistic ability (Carroll, 1999; Towell, 2004; Truscott & Sharwood Smith, 2004). A special attraction of this approach is its concern with specifying how what is strictly linguistic interacts with the rest of cognition. Jackendoff sees the architecture of the language faculty in two closely related perspectives: a knowledge-based one and a processing-based one. In this way, his approach is akin to both Chomsky's and Fodor's at the same time. Like Chomsky, Jackendoff sees abstract grammatical knowledge in modular terms. However, the language module, in Jackendoff's perspective, is itself split up into independent, expert systems so that, rather than talking of a single language "module," "language faculty"

would be the safer of the two descriptions. Whereas syntax lies at the heart of Chomsky's language faculty, Jackendoff's version is not syntactocentric. It includes two equal partners, a syntactic module and a phonological module. Each of these works with its own unique code and set of principles; in addition, a special interface exists to link specific syntactic structures (SS) with specific phonological structures (PS). The syntactic and phonological systems form Jackendoff's version of the language module together with interfaces that extend outside the module, that is, with the perceptual and articulatory systems and with the conceptual system. A word, in this view, is actually an "interface rule" matching a specific PS with a specific SS, and the SS with a specific CS (conceptual structure). These structures themselves reside in one or other of the specialized (phonological, syntactic, or conceptual) lexicons. Hence, the syntactic module, for example, has a set of syntactic formation rules that operate upon the syntactic structures in its syntactic lexicon.

Jackendoff's second, processing perspective, in particular, has appealed to some SLA researchers and is similar to Fodor's in some respects. It meshes neatly with the architecture of abstract knowledge outlined above. Each module has a processor that manipulates structures in its own specialized lexicon, now viewed as a memory store. Whereas Fodor talks mainly in terms of input processing, Jackendoff's system is explicitly bidirectional, handling both comprehension and production. Carroll (2000) used Jackendovian architecture to critique conventional and rather simplistic conceptualizations of second language input. She argues that input can only be used, in the plural, of the internal interfaces between all the various processing modules. Carroll's autonomous induction model (Carroll 2000) posits a separate module that handles cases of parsing failure, using inductive principles to work out solutions. Truscott and Sharwood Smith (2004), on the other hand, argue that Jackendovian processing architecture could be used to account for acquisition without positing special failure-detecting mechanisms. Their MOGUL (modular growth and use of language) model defines acquisition as the lingering effect of processing. As each processing step proceeds in response to input from an adjacent module, each module trying to select the best-fit representation from its own particular memory store, those that finally get selected to form a combined chain of representations gain in strength and become more accessible in future. Structures in each memory store gradually lose accessibility by virtue of repeatedly not being selected by their processor to represent some input. At each step in the processing chain, the innate properties of the current processor and the structures currently residing in its memory store determine what can and cannot be processed. This means that frequent exposure to given grammatical constructions as manifested in the language to which the learner is exposed does not in itself guarantee acquisition.

To sum up, in SLA, the idea of a modular mind, with a language-creating and language-processing system living alongside the systems that deal with sensory input—for example the module that handles vision and the one that handles audition—has been around since the early 1970s. It became more explicitly involved in the 1980s as more and more researchers adopted Chomskian linguistic theory. Fodor's modularity was then appealed to by some researchers as being complementary to Chomsky's. More recently, attention has turned to the possibility of applying Jackendoff's modularity to SLA theory. All these three versions are still in contention, alongside views that hold either that the very idea of a modular mind is fallacious, or that there is simply no language module, or that there is indeed a language module but it only operates in early childhood and is not available for language learning later in life.

Mohanty, Ajit

GIRISHWAR MISRA

Ajit Mohanty has made significant contributions to research on multilingualism, bilingualism, multilingual education, interventions for cognitive development, poverty issues, language processing, and socialization. He was born in 1946 in Puri, Orissa, India, and he graduated from Utkal University, Bhubaneshwar, in 1969 with a master's degree in psychology. His mentors at Utkal included Professors Radhanath Rath and J. P. Das. Mohanty joined the educational psychology program at the University of Alberta, Edmonton, Canada (1973–7), where he taught courses on human development, and earned the prestigious Killam Scholarship and a PhD in psycholinguistics (in 1978) with Professor W. H. O. Schmidt as his supervisor.

Mohanty started his academic career as lecturer in psychology in 1969 and was elevated, at the age of 37, to the position of professor in 1983 at the Centre for Advanced Study at Utkal. In 2003, he shifted to the multidisciplinary Zakir Husain Centre for Educational Studies at Jawaharlal Nehru University, New Delhi, and continues there as senior faculty. He was a senior Fulbright Fellow at the University of Wisconsin, Madison, USA (1981–2), a Senior Fellow at the Central Institute of Indian Languages, Mysore (1986–7), and a Fulbright Visiting Professor at Teachers College, Columbia University (2007–8). Mohanty's training at Alberta helped him develop a critical perspective, scientific rigor, and professional sophistication. On his return from Canada in 1978, he started research on the cognitive consequences of bilingualism among the indigenous Kond people in Orissa, with the methodological advantage of drawing monolingual and bilingual samples from the same sociocultural context. He continued to work on Konds and many other indigenous (tribal) linguistic communities in India. Besides his pioneering work on bilingualism, he worked on developmental psycholinguistics, sentence processing, and reading, focusing on grammatical and orthographic features of Indian languages. He developed a tradition of psycholinguistic research in modern India and trained a generation of scholars.

Some of Mohanty's early works were on the processing of ambiguous sentences, culture and Piagetian conservation, the perceptual complexity of linguistic structures, and reading. Extending the linkages of language and cognition, he investigated aspects of prose comprehension, metalinguistic awareness, and context effects on word order in Kui, Oriya, and Hindi languages. His work on bilingualism and its psychological and pedagogical implications has been seminal. Examining the practices of bi- and multilingualism in society in general and education in particular, he has pioneered multilingual education (MLE) in India and is known for his MLE Plus intervention (in collaboration with Minati Panda) in schools for Kui and Saora children. He worked with Tove Skutnabb-Kangas in 2009 to develop Nepal's policy and strategy for MLE. Currently, he is a member of a team to develop Bhutan's new national education framework in which he focuses on the languages-in-education policy.

Mohanty views MLE for indigenous children as a way out of the vicious cycle of language disadvantage. In his more recent works, he has examined the hierarchical "double divide" among the languages in Indian society and its implications for perpetuating inequality and marginalization. He shows how language disadvantage leads to capability deprivation of tribal mother-tongue speakers in India. He has also examined the issues of identity and intergroup relationship in tribal and nontribal contact situations.

As a leader in the academic world of psychology in India, Mohanty is associated with the movement of indigenous psychology and relevance to the societal context. This has resulted in his analyses of poverty and social disadvantage leading to his concept of the “weaning syndrome” as a possible consequence of gratuitous relief. Language acquisition and socialization have been his other concerns. He has studied the maternal influences on development of speech style in Hindi-speaking children, proposed a stage model of multilingual socialization, and severally analyzed the problems of linguistic minorities in India.

Mohanty is the author of *Bilingualism in a Multilingual Society* (1994). He has co-edited *Psychology of Poverty and Social Disadvantage* (2000, with G. Misra), *Perspectives on Indigenous Psychology* (2002, with G. Misra), *Multilingual Education for Social Justice: Globalising the Local* (2009), and *Social Justice through Multilingual Education* (2009), both with Tove Skutnabb-Kangas, Robert Phillipson, and Minati Panda. Currently he is writing a book on *The Other Side of Multilingualism*.

Mohanty is a fellow of the Association of Psychological Science, USA, and the National Academy of Psychology, India. He is a member of the editorial boards of the *International Journal of Multilingualism*, *Language Policy*, and *Psychological Studies*. He was president of the National Academy of Psychology, India, in 1997. He has undertaken several research projects funded by the Bernard van Leer Foundation of the Netherlands, and by Indian agencies like UGC, ICSSR, and NCERT. He also directs (with Minati Panda) the National Multilingual Education Resource Consortium (www.nmrc-jnu.org) sponsored by UNICEF. Currently he is collaborating with the University of Western Ontario, Canada, in the area of MLE. He has been a guest at the faculty of several universities in India, the USA, Canada, and Switzerland. Recently, he has organized symposia on aspects of multilingualism at the IAAP Congress at Melbourne (July 2010), AASP, Delhi (December 2009), and ICP, Berlin (July 2008). He has been keynote speaker at the 2010 ISSBD, Lusaka (July 2010), the International Conference on Globalization and Languages, Tokyo (August, 2008), the International Conference on Third Language Acquisition and Multilingualism, Stirling (2007), the International Conference on Language and Poverty, Cornell (2005), and IAAP, Madrid (1994).

Mohanty can use at least seven languages and writes newspaper columns, essays, and stories in Oriya.

Monolingual Lexicography

PATRICK HANKS

Introduction: Lexicography in the Age of the Internet

In recent years there has been an increasing focus on the lexicon in applied linguistics, while the technology of dictionary compiling and dictionary publishing has changed beyond recognition, due to the availability of electronic resources such as very large corpora.

If the meaningful use of language is to be understood and applied, it is necessary, in the first place, to “get the words in” (Bolinger, 1970) and, in the second place, to discover how words go together in structures and collocations (Sinclair, 1966, 1987, 1991, 2004). It is now possible to analyze the comparative frequency of each word and to identify its patterns of normal, conventional usage, using a technique called “corpus pattern analysis.” Patterns consist not only of constructions and clause roles such as subject, object, and adverbial (called “valencies” in systemic functional grammar) but also, more importantly, of collocations. Collocations disambiguate; for example, “executing young offenders in Texas” activates a different meaning of the verb *execute* from “executing the Governor’s orders.” So much is obvious. However, the question, “Precisely which collocations of a word activate which of its meanings?” raises some extremely difficult issues at both a theoretical and a practical level. The vocabulary of a language contains hundreds of thousands of lexical items. Discovering which lexical items collocate with which other lexical items more significantly than chance is a task for a computer: Humans manage to do it subconsciously somehow (for this is what enables them to use words idiomatically), but explicit analysis of the statistical significance of collocations is beyond even the most powerful conscious human mind. It can only be done by a computer. The need to analyze collocations computationally was predicted by Sinclair as long ago as 1966, when he commented that the problems of analyzing phraseology were “not likely to yield to anything less imposing than a very large computer.” The significance of collocations (word associations) can now be measured in corpora (very large electronic collections of text), using sophisticated statistical computing tools. At the same time, corpus analysis reveals that a small percentage of the uses of each word is deliberately unconventional and creative in various ways. The dividing line between conventional uses of a word and unconventional, creative ones is fuzzy, however, not sharp.

So in monolingual lexicography of the future it will be necessary to study the interfaces between valency and collocations on the one hand and meaning on the other. It is also necessary to study other interfaces: interfaces of words with speakers’ memories, beliefs, attitudes, and emotions; with the beliefs, attitudes, and emotions of other users of the same language; with the world “out there”; and with other words in the language system. All these contribute to the elusive entity called “meaning”; they are all grist to the lexicographer’s mill.

Central to the role of the lexicon in modern cognitive linguistics is the recognition that analogy (rather than definition) plays a major role in the meaningful use of words. Identifying word meaning is not, as used to be thought, a matter of stating definitions in terms of necessary and sufficient conditions for set membership, but rather of identifying prototypes as a basis for analogical reasoning—specifically, identifying prototypical features of the

concept or concepts that a word denotes. Meaning in natural language is built around prototypes (Rosch, 1973, 1975) or stereotypes (Putnam, 1970), and, thanks to corpus technology, the insights of Rosch and Putnam can now be applied to identifying the stereotypical phraseology associated with each meaning of a word. To date, lexicography has been slow to respond to this opportunity. Lexicographers and language students are, as a general rule, frightened of statistics. It therefore seems necessary to remind them that they do not have to be sophisticated statisticians to use the output of statistical computer programs for the analysis of language. What they need to be able to do is to decide whether the output of such a program is saying something useful and interesting about the meaning and use of a word: sometimes it is and sometimes it is not. So the lexicographer or learner has to *choose* when and how to use the computer's statistical output, which must be presented in a user-friendly way.

Also relevant here is the notion of Wittgenstein (1953) that the meaning of a word such as *game* is best considered as "a chain of family resemblances": Certain semantic features such as winning and losing are characteristic of many games, but not all: There are no necessary conditions for word meaning.

The need for very large corpora has been dramatically fulfilled since the 1990s, but up until now dictionaries have been slow to respond to the theoretical challenges of Wittgenstein, Rosch, and Putnam and to take advantage of the opportunities offered by large corpora. The challenge that Sinclair recognized so clearly in 1966 has at best been only tentatively met. The accounts of word meaning in monolingual dictionaries are still largely based on 17th-century Leibnizian assumptions, in particular that word meanings are discrete entities, like building blocks in a child's Lego set. The role of collocations as meaning determinants and the 'semi-prefabricated' chunks of language that form a large part of all discourse are not yet adequately treated in any dictionary. In older dictionaries of certain European languages, an attempt was made to indicate phraseology, but, as this was done in the pre-corpus era, it was inevitably based on introspection rather than data.

What Is a Dictionary?

A monolingual dictionary is an inventory of the lexicon of a language. (This entry deals only with monolingual dictionaries. For bilingual dictionaries see the list of cross-references below.) For each word or term entered in the dictionary, information is given about its meaning, spelling, pronunciation, and in some cases its origin or etymology, or about some subset of these facts. In languages that use an alphabetical writing system, the entry words in a dictionary are arranged in alphabetical order, often with subentries or "nested" entries for derivatives and idiomatic expressions. This simple fact of arrangement distinguishes dictionaries proper (sometimes called "semasiological dictionaries") from onomasiological reference works such as Roget's *Thesaurus* (1852) and WordNet (<http://www.wordnet-online.com/>), in which words are organized according to their conceptual relationships (synonyms, hyponyms, etc.). In Chinese, which uses an ideographic writing system, words are arranged in groups according to their "radicals" (see Li Ming, 2006). Some present-day Chinese dictionaries add a Pinyin romanization of the Chinese headwords, which are then arranged in alphabetical order so as to facilitate look-up.

Recording the Lexical Inventory of a Language

A dictionary cannot include *all* the words in a language. Even a vast national dictionary of record such as the *Oxford English Dictionary* (OED, 1884–1928) does not have such an aim. This is because the lexicon of any living language is dynamic: New words are coined

every day (and very often forgotten the next day). From the point of view of applied linguistics, it is, however, reasonable to expect a dictionary to include all the words that are in normal use. This poses problems for the lexicographer, because the borderline that divides the words of a language from nonwords is a vast fuzzy gray area. The three main gray areas are: names, register, and technical terms. A few words may be said about each.

Names

Most large dictionaries record and explain terms such as *Scottish*, *Londoner*, *Chaucerian*, and *Kafkaesque*. These words are defined in relation to terms that denote a single entity, in other words names: *Scotland*, *London*, *Chaucer*, and *Kafka*. Should such names also be in a dictionary? Some lexicographers argue that a dictionary should serve as a collective cultural reference index and that famous names such as these should be included and explained for this reason. However, it would obviously be absurd to try to record all the names in the lexicon of a living language. English speakers know that “John Smith” is a common English name, but it is not a term that belongs in a dictionary.

Register

Most dictionaries include at least some slang words and even a few dialect items, but in both these domains there lie many thousands of terms that are included only in specialist slang dictionaries such as Green (2010) or Wright (1898–1905). Nearly all people from the Bristol and Bath area of England know the term *gert lush* (a general expression of approval, connected etymologically with the standard words *great* + *luscious*), but few would expect to find this expression in a general dictionary. Some dictionaries also include archaic terms and senses, especially those that were used by writers such as Shakespeare or Austen, whose works are still widely read today, but again this is a large gray area.

Technical terms

Strobe lighting is a familiar term denoting a familiar phenomenon, and a reader can expect to find it explained in a dictionary. But what about *strobila* and *strobilation*? *Strobilation* literally (etymologically) denotes the act of twisting, but in English it is found only in a highly specialist domain (it denotes the asexual method of reproduction of tapeworms and jellyfish, in which they twist off polyps from their bodies to create new tapeworms or jellies). This is a classic example of a borderline term that is included in some large one-volume dictionaries but not in others. It is not the sort of term that one would expect to find in a dictionary aimed at language learners.

Different Types of Monolingual Dictionaries

Learners' Dictionaries

From the point of view of applied linguistics, the most important type of monolingual dictionary is one compiled for use by language learners. For English, the most important works in this genre (given with the date of first publication) are the *Macmillan English Dictionary for Advanced Learners* (MEDAL, 2002), the *Cambridge International Dictionary of English* (CIDE, 1995; now called the *Cambridge Advanced Learner's Dictionary* or CALD), COBUILD (1987), the *Longman Dictionary of Contemporary English* (LDOCE, 1978), and the *Oxford Advanced Learner's Dictionary of Current English* (OALDCE), first published in Japan in 1942 by Kaitakusha as the *Idiomatic and Syntactic Dictionary* and reissued by Oxford University Press in 1948, with the text unchanged, as the *Advanced Learner's Dictionary*,

ALD). Changes of title in successive editions of this and other dictionaries have created a bibliographical quagmire. Each of these dictionaries has its admirers and detractors; each has some unique selling points. What they have in common is that they all attempt to record and explain all the words of contemporary language that are in normal use, while ignoring abnormal, rare, and unusual words and senses. Some of them use a restricted defining vocabulary of around 2,000 words, sacrificing fine nuances of definition in return for greater comprehensibility. Most of them nowadays base their lexicographical research on a large corpus of English texts. *COBUILD* claims to be “corpus-driven”, while the others are more or less corpus-based (i.e., they use corpus data more selectively). *COBUILD* rejects the traditional style of definition by paraphrase, preferring instead to encode the term being defined in a “full-sentence definition.” For example, where a traditional dictionary says “fly: . . . 4. to travel through the air in an aircraft or as an aircraft does” (where the syntax is necessarily somewhat unnatural due to the principle that the definitions must be substitutable in any relevant context), *COBUILD* characterizes the context at the same time as explaining the meaning, thus: “3. If you **fly** somewhere, you travel there in an aircraft.” *COBUILD* took “folk definitions” and built them into a logical system (Hanks, 1987). They are intended to give users a modicum of implicit guidance on normal phraseology in conjunction with an explanation of the meaning.

Many but not all of the dictionaries just mentioned have been adapted to create American editions. Mention should also be made of *Merriam Webster’s Advanced Learner’s English Dictionary* (MWALD, 2008), a clear, sensible, and thoroughly practical, though conservative, dictionary aimed primarily at learners of English as a second language.

Historical Principles Versus Synchronic Principles

Dictionaries aimed at language learners seek to give an account of the words and meanings that are in everyday usage in the contemporary language. In other words, they are compiled on “synchronic principles.” However, great scholarly dictionaries such as the *OED* do not have this goal. Instead, they are compiled on “historical principles.” That is to say, after stating the etymology, such dictionaries give the oldest meaning of the word first, not the current meaning. Since word meaning is very unstable, these different principles affect many entries; such dictionaries should therefore be used with caution in applied linguistics.

In the first and second editions of the *OED*, a dictionary compiled on rigorous historical principles, sense 1a of *camera* was stated as “an arched or vaulted room or chamber.” This was followed by “2. a council or legislative chamber; one of the departments of the papal curia; 3a. *Optics*. Short for *camera obscura*; 3b. *esp.* that form used in photography.” This entry was completely revised for the 2010 online edition, but still, quite properly in accordance with the dictionary’s historical principles, the older senses were placed first, followed eventually by sense 4b: “A device for taking photographs, using an aperture or lens to focus a visual image on to a light-sensitive material or (in later use) a digital sensor.”

The great *Dictionary* of Samuel Johnson (1755) aimed at historical principles (tempered by common sense). One reason for this is that, in the eighteenth century, people all over Europe, including Britain, believed (wrongly) that etymology somehow guaranteed meaning. In fact, meaning conventions are arbitrary and change from time to time, as the example of *camera* above shows. *Merriam Webster’s third new international dictionary* (MWIII, 1961) also follows historical principles. More surprisingly, the *Merriam Webster Collegiate series* (1898, updated 2006), aimed at the general public rather than linguists and cultural historians, also follows historical principles.

Historical principles were first explicitly challenged by *Funk and Wagnalls Standard Dictionary of the English Language* (FW, 1894), which aimed to put the modern meaning of

each word first. Unfortunately, in the mid-20th century the publisher of this fine dictionary did not invest in keeping the dictionary up to date, nor in publicity for it. By the time Rowan and Martin's *Laugh-In* came along in 1968, with its catchphrase "Look that up in your Funk and Wagnalls", it was too late: The dictionary was already dead.

The synchronic principles established by *FW* were not lost, however: They were followed by other dictionaries aimed at the general public, in particular the *American College Dictionary* (*ACD*, 1947) and its successors and the *American Heritage Dictionary* (*AHD*, 1969). These dictionaries are discussed in the next section.

The Technology of Dictionary Compiling

Lexicography is accretive. That is, every new dictionary builds on foundations laid by at least one of its predecessors. The *American College Dictionary* (*ACD*, 1947) in particular forms part of an accretive chain: It was based on the *New Century Dictionary* (1927), which was itself an abbreviated and updated edition of the multivolume *Century Dictionary* (1889–91). It was the basis for the *Random House Dictionary of the English Language, Unabridged* (*RHD*, 1966) and, in Britain, for the *Hamlyn Encyclopedic World Dictionary* (*EWD*, 1971), which in turn was the foundation of the Australian *Macquarie Dictionary* (1981). American dictionaries such as *ACD*, *RHD*, and *AHD* served as a model for the *Collins English Dictionary* (*CED*, 1979). With its clear definitions and inclusion of much technical terminology and entries for names of famous people and places, *CED* mounted a successful challenge to the market leaders in British dictionary publishing of the mid 20th century: the *Concise Oxford Dictionary* (*COD*, 1911, 1976) and *Chambers's Twentieth Century Dictionary* (*TCD*, 1901, with many subsequent updatings). The latter was a magnificent "ragbag" collection of rare and unusual words and senses—including many obscure Scottish dialectisms—as well as more mundane words. Chambers is also noted for its occasional humorous definitions (e.g., *éclair* is defined as "a cake, long in shape but short in duration"; *middle-aged* is defined as "between youth and old age, variously reckoned to suit the reckoner").

COD has enjoyed a long history; at the time of writing it is in its 11th edition. The 6th (1976), 8th (1990), and 10th (1999) editions represented radical departures from their predecessors: In effect, the title has been borne by four very different dictionaries, which have in common only an approximately similar level of coverage of the language. The 10th edition is based not on the preceding edition, but on the *New Oxford Dictionary of English* (*NODE*, 1998), a much larger work on synchronic principles, which used evidence both from the *OED* reading program and from the British National Corpus to create a new description of the vocabulary of contemporary English in a single volume of "desk dictionary" size.

In 1999 the British publisher Bloomsbury and the American software giant Microsoft combined forces to create a dictionary of similar dimensions, under the generic name "Encarta," touted as "the first dictionary for the electronic age." At first, it was published in a so-called "world edition" (*Encarta World English Dictionary*), but it failed to find much favor with the British, American, or any other market. Subsequent editions were published in Britain and America under a variety of titles including the name "Webster," which seems to have been regarded by the publisher as a recipe for encouraging public acceptance. Despite its grand claim, the Encarta dictionary did not take advantage of lexical research in "the electronic age": it is a very traditional dictionary, paying little attention to such matters as corpus evidence for collocations and phraseology, or to the recent advances in cognitive linguistics and the philosophy of language mentioned at the start of this entry.

From the great dictionaries of the Renaissance, which aimed to record the entire vocabulary of Latin (Calepino, 1502; Estienne, 1531) and Greek (Estienne, 1572), to the best-selling dictionaries of today and *Encarta*, lexicography has been driven by the technology of typesetting, printing, and book publishing. The works by Henri and Robert Estienne in particular pushed the technology of typographic design, printing, and bookbinding to its limits. These limits were refined from time to time between the 16th and the 19th century, but the basic principles remained unchanged until the advent of the 20th century. As early as 1966, the *Random House Dictionary* was compiled using a computer to classify and sort the words and definitions. This meant that lexicographers could be freed from the tyranny of alphabetical order: All terms in a domain could be written as a set and then sorted into place by computer, with resulting benefits for clarity and consistency.

Online Dictionaries of the Future

In recent years, sales of dictionaries in book form have dropped dramatically, while all reputable dictionaries (and some less reputable ones) have become available for online consultation, free of charge. Online publication of dictionaries is opening up tremendous possibilities for complex searches in dictionaries and dramatic shortening of the time-lapse between lexical research and publication of results, links to other information sources, and new business models. An instructive example is OED Online (www.oed.com). For this, in partnership with the software company IDM, a new editing and browsing system called PASADENA was developed (Elliott & Williams, 2006). The new system not only had to be flexible and robust for editors and readers alike (being able to process many thousands of simultaneous hits), but also had to offer improvements in functionality such as tracking the 600,000 cross-references; standardizing the processes for bibliographical references (for example, enabling citations to be updated systematically when a new edition of a cited work was published); flagging probable errors; and many others.

Many other dictionary editing and browsing systems have been developed in the past few years. One of the best (robust and user-friendly) is the DEB dictionary editing and browsing system (<http://deb.fi.muni.cz/debdict/>) created by the NLP group at Masaryk University, Brno, which is now used as a platform by a wide variety of large reference projects in several different European languages.

Lexicography at its best has always been based on careful analysis of the available evidence. With the advent of the Internet, large corpora, and statistical and other tools for corpus analysis, a paradigm shift in the availability of evidence for lexicography has taken place, and this will change the nature and content of future dictionaries. A central feature of lexical research in future will surely be much fuller attention to the contexts in which words are used. Two pioneering projects in this regard, both currently suffering from “funding starvation,” are FrameNet (<http://framenet.icsi.berkeley.edu>) and Corpus Pattern Analysis or CPA (<http://nlp.fi.muni.cz/projects/cpa/>).

FrameNet

FrameNet is based on the principles of frame semantics (see, e.g., Fillmore, 1982), which argues that words must be grouped and explained in relation to context of utterance—the situation or “frame” in which a word is used; thus, there cannot be buying without a buyer, a seller, an object or a service that is bought, and a price paid. This could be described as “the commerce frame.” (FrameNet itself makes more fine-grained distinctions, with at least three relevant frames: *Commerce_buy*, *Commerce_sell*, and *Commerce_scenario*.) The “risk frame” has as its core elements a person who is the risk taker, a valued object that is put at risk, an action or event, a possible bad outcome, and a desired good outcome.

Not all of these frame elements are explicitly realized every time the word *risk* is used, but they are all implicitly present.

At the time of writing, 960 semantic frames have been described in FrameNet, with annotations of over 11,000 lexical units. FrameNet has not set itself a target inventory of frames or frame elements. Frames, their elements, and the lexical units that populate the frames are explored more or less at random. Example sentences are selected from the British National Corpus and annotated to support the relevant sense of each lexical unit in a given frame.

Contrary to the claims of some of its apologists, FrameNet cannot be used—at least for the foreseeable future—for purposes of sense discrimination. This is because it does not make any attempt to investigate contrastively *all* the frames in which any given lexical unit participates. Most of the words analyzed by FrameNet and assigned to one frame or another have at least one other sense that has not yet been analyzed or assigned to any frame.

Corpus Pattern Analysis

The procedure of the Corpus Pattern Analysis project (Hanks, 2004; Hanks & Pustejovsky, 2005) is different. The lexicon is analyzed word by word in a fairly traditional manner. But meanings are associated with patterns of word use, not with words in isolation. The aim is to identify, by corpus analysis, all normal patterns of usage associated with any given word. The first product of CPA is a pattern dictionary of English verbs (PDEV), which currently offers a comprehensive analysis of 700 verbs (out of an eventual total of 5,500—all the verbs in normal use in English). The theme of CPA is that words in isolation (as listed in dictionaries) have only “meaning potential” rather than meaning. Meanings in CPA are associated with phraseological patterns, so the first task is to discover, by comparing huge numbers of actual uses, the normal phraseological patterns of use for any given word. This is not a matter of syntactic alternation: It is a matter of discovering patterns that have contrasting meanings. A “pattern” in CPA typically consists of a verb together with its arguments or valencies: subject, object, and adverbial. The lexical items that populate an argument of a pattern are grouped according to semantic type. Very often, different meanings of a verb are distinguished only by the semantic types of its arguments. Thus, *blowing up a balloon* and *blowing up a building* activate quite different senses of *blow up*, although the syntactic structure in each case is identical. Terms such as [[Building]] (in double square brackets) are used in CPA to denote a semantic type, bringing together a large number of canonical lexical items (e.g., *building*, *house*, *factory*, *university*, *TV station*, *bridge*) and some non-canonical items such as *chimney*. Semantic types are held in a hierarchical “shallow ontology.” The population of each semantic type is in principle open-ended: It is always possible that a new term—or a name—denoting a building will be discovered, or used in some future document.

CPA analyzes *all* occurrences in a randomly chosen large corpus sample of each verb. Each use of the verb in the sample is either assigned to a pattern or treated as an “exploitation of a norm.” Exploitations include various kinds of dynamic language use, including figurative language, anomalous arguments, and elliptical usage. Thus, CPA is not only creating a new kind of dictionary, but also a new linguistic theory, in which dynamic exploitation of normal usage is distinguished from the more static norms on which successful communication relies.

Conclusion

Lexicography has always been closely associated with and partly dependent on technological innovation. We live in a period of technological transition, as computers play an

increasingly prominent role in the lives of ordinary people. Therefore, as suggested in the last few sections, computer technology is likely to play an increasingly important role in lexicography. It is not possible at the present time to predict what form this will take, mainly because the business model for dictionaries is changing. Sales of dictionaries in book form have plummeted in recent years. The traditional business model of funding a new dictionary by a publisher in the expectation of profit from massive sales has evaporated. The alternative—public funding of lexicography through large research grants—which was normal in Central and Eastern Europe during the communist era, lies well beyond the constraints under which most research funding agencies in the capitalist world operate today. At the same time, users of online dictionaries expect the information to be made available free of charge. So dictionary publishers are reliant on what used to be regarded as “subsidiary income” from advertising and other indirect sources—hardly an incentive for a massive capital investment. It may be that, with the sudden explosion in popularity of electronic book-reading devices such as Kindle, dictionaries of the future will be automatically built into such devices. A reader ploughing through a text on such a device will be able to point at a particular word and get not only a dictionary entry for that word, but an “intelligent” dictionary entry, which responds to the context and presents the definition, paraphrase, or synonym set that is most likely to be relevant (drawing on research such as CPA and FrameNet), rather than just a simple list of dozens of senses. Such a development, however, is still far in the future.

Mother-Tongue-Medium Education

TOVE SKUTNABB-KANGAS

Introduction: Mother-Tongue-Medium Education: A Controversial Topic?

Human rights lawyer Fernand de Varennes (see also 1996) writes on the back cover of *Multilingual Education for Social Justice: Globalising the Local* (Mohanty, Panda, Phillipson, & Skutnabb-Kangas, 2009), that the book “addresses directly a still surprisingly controversial topic: the indisputable value of education in one’s own language.” Mother-tongue-medium education *is* controversial, but “only” politically. Research evidence about it is not controversial. If you, dear reader, live in a country where your own language is a/the official language, it has probably been self-evident for you that you (can) have your first language (L1) or mother tongue (hereafter MT) as your main teaching/learning language in school. Most speakers of numerically large languages in countries that have not been colonized are probably not even aware of the privilege that they are enjoying, when they can have their education through the medium of a language that they know and understand, and teachers with whom both they and their parents can communicate easily.

But for almost all the world’s indigenous and tribal peoples and many if not most minorities (hereafter ITMs), and for most children in former colonies in Africa and Asia (regardless of their minority or majority status), this is a dream that they are still fighting for. “About 50 to 70 percent of the world’s 101 million children out of school are from minorities or indigenous people,” and “Over half of the world’s school dropouts are from minorities” (said by Minority Rights Group International when launching their 2009 *State of the World’s Minorities and Indigenous Peoples* report in July 2009).

If ITMs can attend school at all, they are mostly forced to accept education in an alien dominant language, in submersion programs (see below). These are *subtractive*: they subtract from ITM children’s linguistic repertoire; the children learn (some of) a dominant language at the cost of their MTs. They should be *additive*, adding good knowledge of an official or dominant language to a thorough knowledge of the MTs. These children’s access to education is denied because of the wrong medium of education (see Tomaševski, 2001; Skutnabb-Kangas & Dunbar, 2010). This is a violation of ITM children’s human right to education.

It is fair to say that all solid research evidence shows that

- teaching ITM children through the medium of an alien dominant language can have and often has extremely negative consequences. Sociologically, educationally, and psychologically it can be seen as genocidal (see, e.g., Skutnabb-Kangas, 2000; Skutnabb-Kangas & Dunbar, 2010).
- teaching ITM children mainly through the medium of their mother tongues minimally for six to eight years, preferably longer, with good teaching of a dominant language as a second or foreign language (preferably with bilingual teachers), can lead to high levels of bi/multilingualism, and many other positive consequences. Under well-resourced conditions, with qualified teachers, high-quality materials, and so forth,

2 MOTHER-TONGUE-MEDIUM EDUCATION

six years might be just enough; under less fortunate conditions, with crowded classrooms, few materials, poorly qualified teachers on low salaries, and so on, eight years seems to be a minimum (see articles in Heugh & Skutnabb-Kangas, 2010b). The longer ITM children have their MTs as the main teaching/learning languages, the better their school achievement and the better they also learn the dominant language.

The few counterarguments against mother-tongue-based multilingual education (hereafter MLE) for ITM children are political and not research-based.

The rest of the entry addresses two issues extremely briefly:

1. It presents desirable educational goals for ITM children, and relates them to non-models and weak models of bilingual and multilingual education, which do not reach the goals, and strong models, which do, summarizing some results from research on MLE.
2. In order to understand why the models which do not reach the goals are still chosen by politicians and school authorities (and also many parents), it presents fallacies (mistaken beliefs, based on false argumentation) that (have) guide(d) much of educational language planning for ITM children, and refutes them briefly.

Educational Goals and Models for Bilingual and Multilingual Education

A good educational program for both ITMs and dominant group children leads to the following goals from a language, identity, and competence point of view:

- high levels of multilingualism;
- a fair chance of achieving academically at school;
- strong, positive multilingual and multicultural identity and positive attitudes toward self and others;
- a fair chance of awareness and competence building as prerequisites for working for a more equitable world, for oneself and one's own group as well as for others, locally and globally (e.g., Skutnabb-Kangas & Dunbar, 2010).

Once the goals have been clarified, the means to reach them need to be discussed, striving toward "ideal" conditions. "Ideal" models (and there are many) have to be adapted to the various contexts and realities on the ground, in different parts of a country, different districts and different schools (see Benson, 2009). No models or programs can be transferred directly to other contexts without localizing them.

However, we know from research and experience worldwide what some of the general principles, ideal characteristics, and prerequisites are for reaching the four goals and for showing respect for ITM's linguistic human rights (LHRs). Colin Baker (e.g., 2001) presents weak and strong models of bilingual education; I have added "non-models." Some are discussed below.

It is clear from both research and practical evidence that *subtractive submersion education* does not reach any of the goals and does not respect children's LHRs. In *submersion/ "sink-or-swim" programs*,

linguistic minority children with a low-status mother tongue are forced to accept instruction through a foreign majority/official/dominant language, in classes in which the teacher does not understand the minoritised mother tongue, and where the dominant language

constitutes a threat to the MT, which runs the risk of being replaced; a *subtractive* language learning situation. In another variant, stigmatised majority children (or groups of minority children in a country with no decisive numerical and/or power majorities) are forced to accept instruction through the medium of a foreign (often former colonial) high-status language . . . Submersion often occurs in mixed mother tongue classes, mostly without native speakers of the language of instruction, but also in linguistically homogenous classes . . . The teacher may not understand children's mother tongue(s). The foreign language is not learned at a high level; at the same time as children's mother tongues are displaced and not learned in formal domains (e.g., mother-tongue literacy is not achieved). Often the children are made to feel ashamed of their mother tongues, or at least to believe in the superiority of the language of instruction. (Skutnabb-Kangas & McCarty, 2008, pp. 12–13)

Submersion can (and often does) have several kinds of negative consequences, socially, economically, and politically. It can cause very serious mental harm: social dislocation, psychological, cognitive, linguistic, and educational harm, and, partially as a result of this, also economic, social, and political marginalization. It can also (and often does) cause serious physical harm, partly as a long-term consequence of the educational, economic, and political marginalization. It often curtails the development of the children's capabilities and perpetuates poverty, according to theories by Amartya Sen, economics Nobel laureate (Sen, 1985; see Mohanty & Misra, 2000). It is organized against solid research evidence about how best to reach high levels of bi/multilingualism and how to enable ITM children to achieve academically. Dominant-language-only submersion programs "are widely attested as the least effective educationally for minority language students," write May and Hill (2003, p. 1). There are no examples in research of a high degree of success *at a group level* where ITM children taught in an L2 would have succeeded. Even if some individuals may manage, they do it not because of the way their education has been organized but *despite* it.

"Mainstream" education for dominant group children in their own languages, even when foreign languages are taught as subjects, do not make them high-level multilingual either, unless they have extra exposure to the foreign languages (media, travel, and so forth). Both of these belong to non-models.

In *transitional early-exit and late-exit* programs,

linguistic minority children with a low-status mother tongue are initially instructed through the medium of their mother tongue for a few years; the mother tongue is used as an instrument for acquisition of the dominant language, and content. In early-exit programmes, children are transferred to a majority-language medium programme as soon as they develop (some) oral communicative competence in the majority language, in most cases after one to three years. In late-exit programmes children may receive some instruction through L1 up to the fifth or sixth grade; sometimes the mother tongue is taught as a subject thereafter. For both program types, the primary goal is proficiency in the dominant language. (Skutnabb-Kangas & McCarty, 2008, p. 13)

Early-exit and even many late-exit transitional programs for ITM children represent *weak models*. Even when children have a year or two of mother-tongue-medium education before being transitioned to education through the medium of a dominant language, the results are disastrous educationally, even if the child may psychologically feel a bit better initially. The children do not reach any of the educational goals listed above. According to Kathleen Heugh (2009), early transition to the international language of wider communication across Africa is accompanied by *poor literacy in L1 and L2, poor numeracy/mathematics and science, high failure and drop-out rates, and high costs/wastage of expenditure* (e.g., Alidou et al., 2006).

4 MOTHER-TONGUE-MEDIUM EDUCATION

Late-exit programs may achieve some of the goals to some extent, but even so, children's capabilities are not developed maximally. The later the exit happens, the better the results.

However, teaching through the medium of an L2 does not necessarily lead to a low degree of success: dominant group members can be taught through the medium of a foreign language, with a high degree of success, in *immersion programs*. These belong to *strong models* of bilingual education. They reach the goals to a large extent. In *immersion programs for dominant language speakers*,

parents of linguistic majority children with a high-status mother tongue... choose voluntarily to enroll their children in a programme in which instruction is conducted through the medium of a foreign/minority language. Most of the children... [have] the same mother tongue. Teachers... are bilingual so that children can initially use their own language and still be understood... [The] children's mother tongue is not in danger of being replaced by the language of instruction. Although children enrolled in French immersion programs in Canada initially represented a largely homogenous Anglophone population, increasingly, children whose mother tongue is neither English nor French are enrolling in these programs. (Skutnabb-Kangas & McCarty, 2008, pp. 6–7)

Another fairly recent type (e.g., Hawai'i, Aotearoa, the Saami) is *revitalization immersion for indigenous peoples or minorities*. Here,

dominated-group children who have partially or completely lost their ancestral language choose voluntarily, among existing alternatives, to be instructed through the medium of the Indigenous/minority language, in classes with children with the same goal and target language, in which the teacher is bilingual so that children can initially use their dominant language, and in contexts in which that language is not in danger of being replaced by the Indigenous/minority language; an additive language learning context. (Skutnabb-Kangas & McCarty, 2008, p. 7)

A third strong model is *language maintenance or language shelter* programs. Here, ITM

children (often with a low-status mother tongue) choose voluntarily, among existing alternatives, to be instructed through the medium of their mother tongue, in classes with minority children with the same mother tongue, in which the teacher is bilingual and there is a pedagogically sound instructional programme in the majority language as a second or foreign language, also provided by a bilingual teacher. (Skutnabb-Kangas & McCarty, 2008, p. 8)

All strong models have a good chance of achieving all the educational goals listed. In addition, they respect children's LHRs. Comparison of several types of programs for ITM children have been done (including children in African and Asian countries with many ethnolinguistic groups and no numerical majorities, often with an ex-colonial language as a dominant language):

- (a) completely dominant-language-medium *submersion* education from grade 1;
- (b) *early-exit transitional* programs, with mother-tongue-medium education for the first one to two years, followed by using a dominant language as the teaching language;
- (c) *late-exit transitional* programs where the transition from a mother-tongue-medium program to a dominant-language-medium program is more gradual but is mostly completed by grade 5 or 6; and
- (d) *maintenance* programs where the mother tongue is the main medium of education for at least the first eight years, or even longer.

Results on academic achievement show unanimously that the children from program types (a) and (b) are as a group never likely to reach a native-like competence in the dominant language, at the same time as they will not learn their own language properly either (they do not learn to read and write it, for instance, even if a writing system and materials exist) (e.g., Ramirez, 1992; Mohanty, 1995, 2009; Williams, 1998, 2006; Skutnabb-Kangas, 2000; Thomas & Collier, 2002; Alidou et al., 2006; Panda & Mohanty, 2009). Their academic achievement results are mostly very poor at a group level. Children in late-exit transitional programs (c) fare somewhat better, but even their results are much below what they could be.

Solid research shows that the longer ITM children in a low-status position have their own language as the main medium of teaching, the better their general school achievement and the better they also learn the dominant language—provided, of course, that they have good teaching in it, preferably given by bilingual teachers. In addition, they learn their own mother tongues well (in addition to the list above see, e.g., Thomas & Collier, 2002; May & Hill, 2003; Heugh, Benson, Bogale, & Gebre Yohannes, 2007; several articles in García, Skutnabb-Kangas, & Torres-Guzmán, 2006; Skutnabb-Kangas, Phillipson, Mohanty, & Panda, 2009; Heugh & Skutnabb-Kangas, 2010a; and Tollefson & Tsui, 2003; see also Cummins, 2009). If we want to learn from research and experience, mainly mother-tongue-medium education of ITM children should last minimally eight years. Everything else is irrational and costly compromise.

The results also show that the length of mother-tongue-medium (MTM) education is more important than any other factor (including socioeconomic status) in predicting the educational success of ITM students, including their competence in the dominant language.

An example: Ethiopia has an innovative and progressive national education policy, in principle based on eight years of MTM education. Regions have the authority to make their own decentralized implementation plans. Some regions transfer to English medium after only four or six years. The Ministry of Education commissioned a study across all the regions (Heugh et al., 2007; see also Benson, 2009; Heugh, 2009; Heugh & Skutnabb-Kangas, 2010a). Ethiopia's efficient collection of system-wide assessment data shows very clear patterns of learner achievement at grades/years 8, 10, and 12. Those learners who have eight years of MTM education plus English as a subject perform better across the curriculum than those with six years of MTM. These, in turn, do better than those with four years. The learners with eight years of MTM also show similar results in English despite much less school exposure as compared with those who have shifted to English medium much earlier. The only ones exceeding them are children in the capital who hear English daily.

Burkina Faso (e.g., Ilboudo & Nikièma, 2010), Peru (Pérez Jacobsen, 2009; Pérez Jacobsen & Trapnell, 2010), and many other countries are now either implementing or on the verge of implementing minimally late-exit transitional programs. In Orissa, India (Mohanty, Mishra, Reddy, & Ramesh, 2009; Panda & Mohanty, 2009), and in Nepal (Hough, Thapa Magar, & Yonjan-Tamang, 2009; Yonjan-Tamang, Hough, & Nurmela, 2009; Nurmela, Awasthi, & Skutnabb-Kangas, 2010; Taylor, 2010), very promising experiments are also taking place. See, for instance, the new National Multilingual Education Resource Centre in India: www.nmrc-jnu.org/. In the Saami country (e.g., Aikio-Puoskari, 2009; see also the Resource Centre for the Rights of Indigenous Peoples in the Norwegian part of the Saami country: www.galdu.org) and in the Basque country (e.g., Cenoz, 2009) and in many other places mother-tongue-based education (MLE) lasts even longer, with very positive results. There are now many books describing successful mother-tongue-based multilingual education (search in www.tove-skutnabb-kangas.org/en/Tove-Skutnabb-Kangas-Bibliography.html).

Fallacies

In teaching languages, one can often identify a set of guiding principles that teachers and education authorities follow to achieve good results. Phillipson and Skutnabb-Kangas (1986; see also Phillipson, 1992a, chap. 6) presented “the five key tenets” of teaching English as a second or foreign language; we saw all of them as fallacies. Many researchers (such as Cummins, Benson, Heugh) have worked on them more generally, also in relation to other dominant languages. Below is my latest synthesis based on all of us, and more. These tenets, which have guided much of ITM education all over the world, are scientifically false and can rather be (and have been) labeled fallacies. Many have already been refuted implicitly above. Still, many parents, teachers, administrators, and politicians still believe in these fallacies. I will use “English” as an example, but any dominant language can be used instead.

1. **Children have learned their L1 by the time they enter primary school** (*mastery-of-mother-tongue-equals-BICS fallacy*). BICS, basic interpersonal communicative skills, implies speaking fluently, with a native-like accent, about concrete everyday things in contextualized face-to-face interaction (see Jim Cummins’s Web page at www.iteachilearn.com/cummins/ for the concepts BICS and CALP). Children master BICS-related aspects of their L1 around 5–7 years of age whereas CALP-related (cognitive academic language proficiency) aspects start approaching maturity only in the late teens. According to this fallacy ITM children need no more MT teaching in school since they already “know” it; what they master is BICS, but many years of MTM teaching is needed to develop their CALP to a high level.
2. **Once children can speak English this means that they can learn through English (use it as a medium of teaching the curriculum)** (*L2-BICS-equals-L2-CALP fallacy*). BICS-related aspects of an L2 can develop in school in a couple of years whereas it takes five to nine years to develop age-appropriate CALP, again depending on the conditions. CALP levels are decisive for school achievement; ITM children should not be taught through the medium of an L2 in decontextualized linguistically and cognitively demanding subjects before their L2 CALP is fully developed, that is, certainly not before grade 7, and under some conditions later.
3. **The earlier English (L2) medium instruction begins, the better the results, also since children learn languages faster than adults** (*early start fallacy*). Several types of program have shown that if teaching a foreign language as a subject or teaching through the medium of a foreign language is *additive*, it *can* start early. Also early foreign language teaching in “mainstream” programs shows it. But a large longitudinal Swedish study (Holmstrand, 1982) showed that the gains of starting a foreign language as a subject early were minimal. In general, adults are better language learners than children. Immersion programs show that *additive* early start with a foreign medium is perfectly possible. On the other hand, if the learning of another language is *subtractive* (as it is in all the non-forms and weak forms of bilingual education), the earlier it starts the worse the result.
4. **The more time the school spends on teaching and using English, the better children will speak English** (*maximum exposure fallacy*). Provided the quality of the instruction in L2 is the same in two models, one with maximum exposure to L2, the other with much less exposure to L2, but high quality MTM instruction instead, two types of result have emerged: Either there is *no relationship between time-on-task and L2 results*, meaning both groups perform equally well in L2, despite the MTM group having had much less exposure to L2. Alternatively, there is a reverse relationship: the less time that is used on instruction through the medium of the dominant language, the better

the results in L2, again provided that the time is instead used on both good MTM teaching and good subject teaching of L2, given by bilingual teachers (Ramirez, 1992; Cummins, 2009).

5. **If other languages (i.e., children's L1s) are used much, standards of English will drop** (*subtractive fallacy*). This is an old fallacy. For instance, the Norwegian School Law of 1880 (the "Magna Carta of Norwegianization"), paragraph 3, said: "Instruction in the school is in the Norwegian language. The Lappish or Finnish languages are used only as a means of helping to explain what is impossible to understand for the children . . . Even if the majority of the children in a group do not understand Norwegian, the teacher must always keep the above regulations in mind and remember that it is imperative that the Lappish and Finnish languages are not used more than absolutely necessary" (quoted in Lind Meløy, 1980, pp. 122–3).

Compare this with the policy offered to children in Africa and Asia almost 100 years later, in the pedagogical tradition which still dominates English teaching: "The teaching of vocabulary should be mainly through demonstration in situations. When, however, a very brief explanation in the mother tongue is sufficient to ensure that the meaning is fully and accurately understood, such explanation may be given" (Makerere Report, 1961, p. 13, probably the most influential document on policy and methods for teaching English in ex-colonial countries; Phillipson, 1992a, chap. 6). Today, in all parts of the world, the use of the mother tongues of ITM children is still restricted or forbidden, through regulations, or through the educational structure where teachers do not know the MTs of their children.

6. **English is best taught monolingually** (*monolingual fallacy*). This fallacy is closely related to the subtractive fallacy. It prevents contrastive teaching, where the languages are compared and where the teacher can show what in the *common underlying proficiency* for both languages (Cummins) can be used by the children and what they need to learn separately for both languages. The fallacy prevents or delays the development of the metalinguistic awareness (knowing how languages function) that seems to be the main causal factor in most of the cognitive and other benefits accruing from high-level multilingualism (e.g., Mohanty, 1995).
7. **The ideal teacher of English is a native speaker** (*native speaker fallacy*). Quality second/foreign language teaching depends on teacher qualifications, not nativeness. There are few aspects where well-qualified non-native teachers cannot be as good as or better than native speakers (Rampton, 1990; Phillipson, 1992b; Skutnabb-Kangas, 2000). Monolingual teachers are bad role models for children who are to become bilingual. In my view, a monolingual language teacher for ITM children is by definition incompetent.
8. **If ITMs are taught in their own groups/classes/schools, especially through the medium of their own languages, this prevents integration and leads to segregation and ghettoization** (*segregation fallacy*). To counteract the segregation fallacy, distinctions between physical as opposed to psychological segregation/integration, and between segregation as a goal or a means are helpful. For many ITMs, at least initial physical segregation from dominant group members seems to be a necessity in order to enable later integration psychologically and competence-wise. If physical segregation in MTM classes ensures that students have a better chance of acquiring the prerequisites for later integrating themselves linguistically, content-wise, psychologically and physically, then initial physical segregation is used as a positive means toward a later integrationist goal. ITM students are, of course, psychologically integrated in MTM classrooms with other children with whom they share an MT. Here they have a better chance of being appreciated for who they are and what they know, rather than the system defining them as deficient or below the norm, as is often the case when they are physically

“integrated” in the dominant group. Forced initial physical integration into a dominant language and dominant group classroom may prevent dominated group students from acquiring the competencies they need (Skutnabb-Kangas, 1984, 2000).

These beliefs in a monolingual L2-teaching methodology, monolingual teachers, maximum exposure, and the other fallacies, which result in forbidding the minority language or restricting its use, have today developed from the earlier crude forms to their present more sophisticated forms. These are at least equally effective in committing linguistic genocide but without letting children and parents notice that this is what is happening. It is extremely important to recognize that the ideology is still the same.

Motivation in Second Language Acquisition

EMA USHIODA

The word *motivation* derives from the Latin verb *movere* meaning “to move.” What moves a person to make certain choices, to engage in action, to persist in action—such questions lie at the heart of motivation theory and research. Within the field of second language acquisition, motivation research has predominantly focused on these kinds of *what* and *why* questions, such as: What reasons motivate people to learn languages? Why are some people more motivated to learn languages than others? What types of motivation are more effective in language learning and why? Since the turn of the 21st century, however, increasing attention has been paid to *how* questions, such as how motivation develops and emerges in interaction with the social learning environment. Though informed by theories of learning motivation in educational psychology, motivation research in second language acquisition has evolved somewhat independently, shaped by a concern to address the unique social, psychological, behavioral, and cultural complexities that acquiring a new communication code entails.

Motivation research in second language acquisition owes its origins to two Canadian social psychologists, Robert Gardner and Wallace Lambert, who conducted a series of studies investigating language learning attitudes and motivation dating back to 1959, and published a report in 1972 that was to prove seminal in shaping the field for the next two decades. They theorized that motivation was a significant cause of variability in second language acquisition, and that it was independent of cognitive characteristics such as ability or language aptitude. They also speculated that learning a second language had important social and psychological dimensions which distinguished it from other types of learning motivation, since learners are expected not simply to acquire knowledge of the language but to identify with the target language community and adopt their distinctive speech behaviors and styles. Individuals’ attitudes toward the target language community, as well as their ethnocentric orientation in general, were hypothesized to exert a directive influence on their language learning behavior. This hypothesis led Gardner and Lambert (1972, p. 132) to propose two kinds of motivational orientation in language learning: an *integrative* orientation reflecting a sincere and personal interest in the people and culture represented by the other group, and in its strong form, a desire to integrate into their community; and an *instrumental* orientation reflecting the practical value and advantages of learning a new language.

Founded in the bilingual social context of Canada, second language motivation research thus originated in a social-psychological framework implicating the social context of second language acquisition and attitudes and relations between different linguistic communities. This social perspective distinguished second language motivation research from the individual-cognitive perspectives then dominating mainstream motivational psychology. Through the 1990s and the turn of the century, however, efforts were made to bring motivation research in second language acquisition more in line with cognitive theories of motivation, leading to a sharper focus on the classroom setting, and on relationships among individual motivational cognitions (e.g., goals, beliefs, perceptions of competence),

2 MOTIVATION IN SECOND LANGUAGE ACQUISITION

learner behaviors (e.g., effort, task engagement or avoidance), learning process and experience (e.g., success, failure), and features of the learning situation (e.g., materials, teaching methods, interpersonal relations, competitive versus collaborative learning environments).

Nevertheless, despite the increased focus on the classroom setting in the study of language learning motivation, the complex social and cultural implications of acquiring a new communication code have continued to preoccupy motivation researchers in second language acquisition; and Gardner and Lambert's concepts of integrative and instrumental motivational orientation have maintained their enduring influence on theorizing about why people learn languages or choose particular languages to learn. Within the last decade or so, however, there have been growing discussions in applied linguistics about the global spread of English which have provoked a reconsideration of the integrative motivation concept. In the case of English as target language, researchers have begun to question whether the concept of integrative orientation towards English language speakers, their community and culture, makes sense, given the status of English as a global language and lingua franca spoken by a global community of which, by definition, the English language learner is also a member; and given the increasingly common status of English as a basic educational skill in many elementary school curricula, alongside literacy and numeracy. As a consequence, research attention has recently shifted from attitudes to and identification with external reference groups (i.e., target language communities), and it has begun to focus instead on the internal domain of self and identity and to consider language learning motivation as a process of identification within the person's self-concept.

In particular, Zoltán Dörnyei (2009a) has developed a new conceptualization of the "L2 Motivational Self System" centered on people's vision of themselves in the future. Its central concept is the *ideal self*, signifying the attributes that one would ideally like to possess (i.e., a representation of personal hopes, aspirations, or desires). A complementary concept is the *ought-to self*, signifying the attributes that one believes one ought to possess (i.e., a representation of someone else's sense of duty, obligations or responsibilities). A basic tenet is that if proficiency in the target language is integral to one's *ideal* or *ought-to* self, this will serve as a powerful motivator to learn the language because of our psychological desire to reduce the discrepancy between current and future self states.

Whether informed by social-psychological, individual-cognitive, or self-perspectives, motivation in second language acquisition has traditionally been conceptualized as an individual difference variable that is implicated in language learning success, alongside other individual difference variables such as aptitude, personality, or cognitive style. According to this view, motivation is something that is located within the inner psychological life of the person, which may be influenced by a variety of external factors (e.g., teachers, parents, examinations) or experiences (e.g., travel, intercultural encounters), and which affects how the person engages in, persists at, and succeeds in the learning process. In short, motivation has been conceptualized as a component in a cause-and-effect relationship, whereby external factors influence motivation, motivation influences learning behavior and outcomes, and these outcomes (e.g., success or failure) may in turn influence subsequent motivation. A major aim of motivation theory and research is to predict and identify what types of external factors (e.g., teacher behaviors or strategies) may have a positive effect on learner motivation, and what forms of motivation may result in optimal learner behaviors and outcomes.

Since the turn of the century, however, researchers have begun to recognize the limitations of cause-and-effect models of motivation and learning behavior. Such models conceptualize motivation as measurable cause or product of particular variables, but shed little light on how motivation develops and evolves in dynamic interaction with the complex range of learner-internal, social, and contextual processes that characterize learning. Nor do they shed light on why the same classroom setting, learning tasks, teacher behaviors, and

strategies may affect the motivation of its learners in different ways, leading to different kinds of motivated engagement or non-engagement in learning. In short, cause-and-effect models can explain the workings of motivation only in rather general terms of how certain types of learner are likely to feel motivated and behave in certain ways in response to certain kinds of contextual factors. In this sense, in the pursuit of generalizability, such models eliminate much of the messy complexity, unpredictability, and variability of individual motivation.

In recent years, alternative theoretical perspectives have come to the fore to try to address some of these limitations. There has been a growing concern with the dynamic nature of motivation as process (rather than measurable cause or product), and with how motivation evolves in organic interaction with a host of cognitive, affective, experiential, social, and contextual processes. A key issue now emerging is how to integrate the individual and context in the analysis of motivation. This issue mirrors similar theoretical concerns in contemporary mainstream motivational psychology, and also reflects broader debates within applied linguistics concerning social-interactive and complexity theory perspectives.

One approach to integrating the individual and context has been to draw on sociocultural theory as an analytical framework for exploring the socially constructed growth of motivation. Central to Lev Vygotsky's (1978) sociocultural theory of mind is the principle that higher order cognitive functions are internalized from social interaction with more competent others. Martha Bronson (2000) explains how this principle applies also to the socialization of motivation for culturally constructed goals and activities, such as literacy, music, sport, or language learning. Viewed thus, motivation, like knowledge, is not located solely within the individual but is socially distributed, created within cultural systems of activities involving the mediation of others (Rueda & Moll, 1994). Motivation researchers who draw on sociocultural theory thus characterize motivation as a dynamic situated process, emergent through the interactions among participants, context, and sociocultural activity (e.g., Hickey & Granade, 2004; Ushioda, 2007).

Moreover, a key insight that sociocultural theory brings to bear on the analysis of motivation is the need to engage with multiple perspectives in order to explore how different participants construe events and are thus motivated in different ways, given ostensibly the same learning context and conditions. This insight comes specifically from activity theory, where "activity" is understood in its sociocultural theoretic sense to comprise the behavior that is actually produced when a task is performed. While a language task assigned by the teacher may offer a general blueprint for what learners are expected to do, learners bring their own uniquely individual personal histories, agendas, goals, motives, and interpretations to the task, and thus each engages in a uniquely individual "activity." In any classroom setting, the activity system to emerge from the complex of social relations, interactions, and individual histories, agendas, and motives is thus far from stable and unitary, potentially characterized by tensions, dissonances, fluidity, and change (Lantolf & Genung, 2002).

The potential for conflict and constraint is highlighted too in more critical approaches to integrating individual and context in the analysis of motivation. Such approaches focus in particular on unequal power relations in language learners' struggle to participate in interactional settings in desired social, educational, or professional communities of practice. Strongly influenced by feminist and poststructuralist theory, Bonny Norton (2000) has developed a concept of language motivation as *investment*, which she defines as "the socially and historically constructed relationship of learners to the target language, and their often ambivalent desire to learn and practice it" (p. 10). When learners invest in a second language, they do so in the hope that they will acquire a wider range of symbolic and material resources, which will enhance their cultural capital, their conception of themselves, and their desires for the future. A person's investment in a language may be

4 MOTIVATION IN SECOND LANGUAGE ACQUISITION

mediated by other investments that may conflict with the desire to speak, such as fear of being marginalized as an immigrant, or resistance when one's professional status or cultural background is not valued. In short, an investment in a new language is also an investment in one's identity, where identity is a site of struggle, being locally constructed, negotiated, and re-formed each time through a person's interactions with others. In this sense, motivation to learn and use a second language may be socially constrained rather than socially constructed, thus further complicating the issue of how to integrate individual and context in the analysis of motivation.

Yet another complicating issue is the difficulty of isolating "motivation" as an individual difference characteristic from the range of cognitive, affective, and emotional processes that interact with one another (and the social environment) to shape engagement in learning. For example, John Schumann's (1997) work on neurobiology and motivation in second language acquisition highlights the inseparable nature of cognitive, motivational, and emotional processes at the level of neural networks and mechanisms. Addressing these issues, Dörnyei (2009b) has recently argued against an individual difference approach to motivation (and other learner characteristics) in favor of a dynamic systems theory framework. Dynamic systems approaches concern the behavior of complex systems that contain multiple interconnected components, where development is characterized by non linear growth as systems adapt and evolve organically in response to contextual processes, and in ways that contribute to shaping context. As Dörnyei argues, adopting a dynamic systems perspective on second language acquisition processes renders the notion of discrete individual difference variables (such as motivation) rather meaningless, since processes of motivation, cognition, emotion, and their constituent components continuously interact with one another and the developing context, thereby changing and causing change, as the whole system restructures, adapts, and evolves. In a similar vein, in order to capture the mutually constitutive relationship between persons and the contexts in which they act, Ema Ushioda (2009) has put forward a "person-in-context relational view" of motivation as an organic process that is emergent through the interactions between the reflexive intentional agency of the person, and the fluid and complex systems of social relations, activities, experiences, and multiple micro- and macro-contexts in which the person is embedded, moves, and is inherently part of.

From a methodological point of view, the current emphasis on sociocultural, relational, and dynamic systems perspectives on motivation in second language acquisition raises issues and challenges for empirical research. The study of motivation in second language acquisition has been characterized by a solid tradition of empirical investigation. To date, this tradition has been dominated by quantitative methodologies suited to investigating social-psychological and individual-cognitive perspectives on motivation as an individual difference characteristic implicated in language learning success. Since motivation is not directly observable, such methodologies have typically relied on gathering self-report measures of motivation, such as how much learners agree or disagree with or rate the importance of certain statements reflecting particular attitudes, intentions, or behaviors. To minimize the inherent subjectivity of such data, considerable attention has been paid to constructing rigorous measurement instruments with good psychometric properties, as exemplified in the standardized attitude/motivation test battery developed by Gardner (1985) and his associates in Canada. These motivation measures are then entered into statistical analyses of relationships with other independent or dependent variables, such as measures of language aptitude, anxiety, or second language proficiency (e.g., Gardner, Tremblay, & Masgoret, 1997).

However, these quantitative methods of inquiry are ill equipped to investigate more complex, dynamic, and contextual perspectives, since such methods typically rely on superficial snapshot measures at a particular point in time and are not sensitive to the

complex particularities of evolving motivational experiences or individual-contextual interactions. Since the turn of the century, more qualitative methods of inquiry have gradually begun to complement the dominant quantitative paradigm, in an effort to address the dynamic and situated complexity of language learning motivation. In particular, unstructured or semi-structured interview techniques have been used to elicit in-depth self-report data on motivation and motivational experience, with the transcribed data then subjected to thematic analysis (e.g., Ushioda, 2001). While interview studies are inevitably limited in scale and scope, the data elicited can offer very rich insights into the process and experience of motivation, particularly when a longitudinal research design is adopted with multiple interviews with participants. Moreover, limitations in the scope of the dataset can be offset by complementing it with more large-scale quantitative data in a mixed methods research design. In particular, with current moves towards more contextually grounded socio-dynamic perspectives on motivation, the exploration of individual-contextual interactions is likely to entail triangulation of multiple forms of data from diverse perspectives (e.g., interviews with teachers and students, classroom observations, classroom interaction data, focus group discussions, learner reflective writing), in order to capture a rich holistic analysis of motivation-in-context, rather than relying (as traditionally) on a single set of self-report measures.

An interesting concluding observation to make about motivation research in second language acquisition is that it has endured a rather marginalized position within the field, remaining somewhat isolated from the more mainstream linguistic and psycholinguistic traditions of research that have prevailed. This is despite the fact that motivation is widely recognized as a prerequisite for successful second language learning to take place. One explanation for this lack of interaction with mainstream research in the field is that, to date, the analysis of motivation and its role in language learning has largely been at the level of global learning outcomes or measures of proficiency, and research has had rather little to say about how motivational factors and processes relate to the interim processes and intricacies of second language development. However, once motivation becomes viewed as an integral part of the evolving organic and adaptive system of cognitive, affective, and contextual processes shaping language learning, it is clear that the analysis of motivation can no longer be separated from the central concerns of second language acquisition research. Moreover, it seems likely that the analysis of motivation may now play a major role in any complex or dynamic systems perspective on second language acquisition, given the need to consider the processes of human agency, intentionality, and reflexivity that are fundamental to the dynamic interactions between self and context.

Multicompetence

VIVIAN COOK

The term “multicompetence” was originally defined as “the compound state of a mind with two grammars” (Cook, 1991); in the context of that paper, “grammar” was used in the Chomskyan sense of the total knowledge of language in the mind (the I-language) leading some people to infer wrongly that multicompetence was restricted to syntax. The current working definition is “the knowledge of more than one language in the same mind or the same community”: everything a single person or a single community knows about all the languages they use. Multicompetence thus presents a view of second language acquisition (SLA) based on the second language (L2) user as a whole person rather than on the monolingual native speaker. It is neither particularly a psychological concept, as some have claimed (Kelly Hall, Cheng, & Carlson, 2006), nor particularly sociological. It is a perspective for viewing both broad approaches to SLA and thus applies both to the individual and to the community. It is perhaps closest to approaches that treat language as a continuously changing system (De Bot, Lowie, & Verspoor, 2005).

Multicompetence therefore involves the whole mind of the speaker, not simply their first language (L1) or their second. It assumes that someone who knows two or more languages is a different person from a monolingual and so needs to be looked at in their own right rather than as a deficient monolingual. Multicompetence is thus neither a model nor a theory so much as an overall perspective or framework: it changes the angle from which second language acquisition is viewed. It constitutes a bilingual “wholistic” interpretation of bilingualism as opposed to a monolingual “fractional” interpretation of bilingualism, in Grosjean’s (2008) terms.

In the 1960s the conceptual breakthrough in the linguistic study of language acquisition was the independent grammars assumption that children do not distort the adult language system but invent systems of their own. This insisted that children are not defective speakers of adult language but speakers of a distinct language with its own rules, vocabulary, and phonology, which gradually develop into the adult’s linguistic competence. The idea soon crossed over into the nascent field of second language acquisition (SLA) research through such concepts as “interlanguage.” It was generally assumed that L2 learners too speak languages that do not correspond to established languages such as Spanish or English but have their own properties, created by L2 learners in a similar way to L1 children. Interlanguage opened the floodgates of SLA research and became an almost unchallenged axiom.

Multicompetence and the Native Speaker

Multicompetence proposed to take the concept of interlanguage seriously. If L2 users are to be treated in their own right, the native speaker has no particular status: it is the users’ own language that matters. This remains the key aspect of multicompetence. If a native speaker is someone who still speaks the first language (L1) that they learned in childhood, being a native speaker is “an unalterable historic fact; you cannot change your native language any more than you can change who brought you up” (Cook, 1999); you can try to pass as a native speaker of another language but never become one—by definition.

2 MULTICOMPETENCE

Multicompetence thus includes the first language, the interlanguage, and other aspects of the L2 user's mind.

Some arguments in favor of using multicompetence as a basis for research are:

- *the normality of the L2 user.* In many parts of the world like India and the Cameroon, monolinguals form a small minority: everybody has to use more than one language in their everyday lives. Brutt-Griffler (2002) has argued for the multicompetence of the community: rather than a community being defined by a single language, many communities in say India or Central Africa have multiple languages at their core, specialized by function and so on. While it is hard to get exact figures, multicompetence is probably not so much an exception as the norm for 21st-century human beings.
- *the rights of individuals.* Linguistics has progressively refused to classify speakers in terms of groups of which they are not, and never could be, members, first granting independence to primitive languages, then freeing children's language from adults' (the independent grammars assumption), then liberating black English speakers from white, working-class restricted code from middle-class elaborated code and women's language from men's. The only group still to be judged by the standards of another is L2 users. But they too have the right to use language appropriately for their needs, not for those of a native speaker group to which they can never belong.

Despite its acceptance of interlanguage, much SLA research has nevertheless continued to measure L2 users against native speakers; that is to say, it has not treated multicompetence as the default and has not recognized them as a group with rights of their own. Consequently what L2 users do is seen as a mistake whenever it fails to conform to the language of monolingual native speakers and the L2 users' level of language proficiency is seen as deficient rather than different: it's all right if your English accent proclaims you come from Newcastle upon Tyne but not from Paris. This native speaker comparison lurks behind such typical statements as: "The lack of general guaranteed success is the most striking characteristic of adult foreign language learning" (Bley-Vroman, 1989, p. 42). It is possible to measure ducks in terms of swans. But when everything has to satisfy the swan criteria, the unique qualities of ducks will always elude the observer, just as black English, working-class English, and women's language were once seen as pale shadows of a "true" variety. Unique functions of L2 user language like code switching and translation will never show up in a native speaker model; unique grammatical forms of L2 users will appear just as mistakes.

While overt denigration of L2 users for not being native speakers is now less common, the perennial SLA research questions continue to revolve around whether the L2 user is like a native speaker. Whether age affects L2 learning depends on speaking like a native as the ultimate attainment of L2 learners is assessed in terms of "absolute native-like command of an L2" (Hyltenstam & Abrahamsson, 2003); whether L2 learners have access to universal grammar is seen as depending on whether they attain the identical grammar to native speakers (Clahsen & Muysken, 1989). The typical SLA research techniques outlined in Cook (1997) consist of error analysis (i.e., mostly defining errors as things native speakers would not do), obligatory occurrences (omitting elements that native speakers would not leave out), grammaticality judgments (based on the "correct" native speaker grammar), elicited imitation (defined by how the native speaker would repeat), and so on. The commitment to the independent L2 user in SLA research is often a matter of rhetoric rather than the reality reflected in its research questions and techniques.

But what term should be used to describe people who are multicompetent? People who acquire their first language are not regarded as L1 learners for the rest of their lives. Why should people who know more than one language be treated differently? Calling people

L2 learners seemed to confirm their subordinate status. Hence the more neutral term “L2 user” was introduced. “L2 user” refers to people who know and use a second language at any level; multicompetence is not restricted to high-level L2 users but concerns the mind of any user of a second language at any level of achievement. “L2 learner” is reserved for people who have no everyday use of the second language, say children in foreign language classrooms. Of course L2 users may also be L2 learners at different times of life or indeed times of day—an L2 learner of English in London who steps out of the classroom immediately becomes an L2 user of English. More recently, at least five different groups of L2 users have been distinguished (Cook, 2009a): those using an L2 within a larger community, say Arabic residents of Berlin using German; those using it internationally for restricted functions, for example, Muslims using Arabic for religious purposes regardless of their first language and the country in which they live whether Germany or Saudi Arabia; those using it globally for a wide range of functions, primarily nowadays the use of English as a lingua franca (ELF), say for business, tourism, or electronic communication; those using it with spouses, siblings or friends with different first languages; and those historically from a particular community (re-)acquiring its language for cultural use, say British Chinese speakers of Cantonese learning Mandarin. Each of these groups undoubtedly have specific qualities that do not generalize to L2 learning in general. The people usually studied in SLA research are, however, classroom L2 learners, many of whom are not and never will be L2 users, for example Chinese children learning English at school in Shanghai, and immigrants adjusting to a new country (hence the importance of age of arrival rather than age itself in much SLA research).

The multicompetence perspective was first supported by reinterpreting research from various domains to show the effects of learning second languages on the human mind. But it led to research specifically aimed at multicompetence that generated research questions which had previously barely been mentioned.

Effects of the L2 on the L1

A vast amount of SLA research has looked at the effects of the first language on the second, labeled “transfer” or “crosslinguistic influence,” still a favorite topic for dissertations exploring yet more first languages or novel aspects of language. By looking at the whole learner’s mind, multicompetence opened up reverse transfer from the second language to the first. A new research question was then: Do you still speak your first language like a monolingual native speaker when you know another language? A negative answer to this could reverberate across SLA research, and indeed much linguistics, as it would be unsafe to regard any person who knows another language as having “normal” monolingual linguistic competence; “the judgments about English of Bloomfield, Halliday or Chomsky are not trustworthy, except where they are supported by evidence from ‘pure’ monolinguals” (Cook, 2002).

In virtually every aspect of language studied, L2 users have turned out to be different from monolinguals. To take some representative studies:

- *phonology*. Much research has shown the changes in voice onset time (the duration of silence that distinguishes voiced and unvoiced plosive consonants) in the L2 user’s first language, for example English/Spanish (Zampini & Green, 2001).
- *lexicons*. Many have argued for a single lexicon in the L2 user’s mind where words from one language are stored alongside words from the other. An L2 user seems unable to switch off one language entirely while processing another, only to lower the level of activation. Spivey and Marian (1999) for example showed in an eye-tracking task that words from one language were activated even when processing the other.

4 MULTICOMPETENCE

- *syntax*. The L1 syntax of the L2 user is subtly altered by the second language they know. Using a competition model paradigm, Cook, Iarossi, Stellakis, & Tokumaru (2003) found that the cues to the processing of L1 word order change when another language is known.
- *pragmatics*. Russians who knew English interpret film sequences differently from monolinguals (Pavlenko, 2003). L2 users indeed have a range of functions for language such as code switching and translation unknown to monolinguals.

Indeed more than language has changed in the L2 user's mind. Learning another language helps with learning to read the first language, and with metalinguistic awareness. Knowing another language delays the onset of Alzheimer's disease (Bialystok, Craik, Klein, & Viswanathan, 2004) and develops the areas of the brain responsible for control (Green, 2011). All of these support the proposition that the L2 user is a distinct kind of person from a monolingual.

Bilingual Cognition

The focus in recent research has been on the different ways in which L2 users think. The research looks at well-known areas where cognitive difference has been shown to occur crosslinguistically between a pair of languages and then sees how L2 users of the two languages think. Typical areas include:

- *shape and material*. Cook, Bassetti, Kasai, Sasaki, & Takahashi (2006) found that Japanese L2 users of English living in England for some years had moved some way towards the English preference of classifying objects more by material than by shape.
- *colors*. Many languages recognize two distinct "blue" colors where English has only one. Athanasopoulos (2009) showed that speakers of Greek who had learned English had altered classifications of colors.
- *gender*. Speakers of grammatical "arbitrary" gender languages tend to assign gender to inanimate objects in the natural world; this effect is diminished for those who know two languages with different gender systems (Bassetti, 2007).
- *motion*. Descriptions of motion events from L2 learners are affected by their first language. The division between satellite and verb-framed languages has generated masses of L2 research, showing effects of knowledge of two languages on ideas of motion.

Multicompetence and Language Teaching

The multicompetence idea has important implications for language teaching, which has often seen its task as making students as much as possible like native speakers. Multicompetence is now starting to be utilized in books on SLA and language teaching (www.youtube.com/watch?v=LF7zmsqtIUQ).

- *Goals of language teaching*. Multicompetence takes the goal of language teaching as producing a successful L2 user, not an imitation native speaker. It thus aligns with the English as lingua franca (ELF) movement rather than with the common European framework of reference, which seems to use the native rather than the L2 user as a touchstone.
- *The language-teaching classroom*. The multicompetence perspective does not see any virtue in making the students use only the second language in the classroom since this denies the very existence of the first language in their minds. It advocates principled

use of the second language when classroom goals can be achieved more efficiently by its use (Cook, 1999).

- *Native speaker language teachers.* A non-native speaker teacher (NNST) is an L2 user who has acquired another language; a native speaker teacher (NST) is not. Hence the NNST can present a role model for the students, has learned the language by a similar route to the students, and can code switch to the students' own language when necessary. The NST's only substantive advantage may be a greater facility in the target language, but as a native speaker not as an L2 user.

Overall the development of a multicompetence perspective has been fruitful in suggesting not only new interpretations of existing theories and phenomena but also new research questions to be tackled. It has gone some way to redressing the bias in favor of the native speaker. But its importance extends beyond SLA research to linguistics, psycholinguistics, and psychology in its insistence on the uniqueness of the L2 user. The fundamental questions of linguistic competence and language acquisition are different if most human minds in fact know more than language. In particular it is a "question whether UG theory can achieve its basic task of describing how human minds acquire, store and use language without taking into account the minds that cope with more than one language" (Cook, 2009b). Chomsky's four questions for linguistics (Chomsky, 1988), namely accounting for knowledge of language, its acquisition, use, and physical manifestation in the brain, are transformed when multicompetence—knowledge of languages in the plural—is the normal state of the human mind: rather than the dominant form of language knowledge, monolingualism becomes an aberration due to language deprivation of second language input. "The monolingual native speaker is language-deprived; they would have acquired multicompetence in more than one language if their caretakers had not deprived them of a second language" (Cook, 2009b).

Multiculturalism and Second Language Learning

RYUKO KUBOTA

Multiculturalism reflects cultural, ethnic, racial, linguistic, and religious diversity brought about by mobility of people in the processes of colonization, slavery, migration, and other historical causes. The rise of globalization, especially, has made conspicuous the multicultural conditions of many societies. Reactions to multiculturalism shape public policies including education. Multiculturalism conceptualized in education may address not only the aforementioned types of diversity but also other kinds of human difference, such as gender, class, language, sexual identity, and disability. The term “multicultural education” is often used in such countries as Australia and the USA, whereas it is commonly referred to as “antiracist education” in Canada and the UK and “intercultural education” in many Western European nations (Banks, 2009). In other parts of the world as well as these countries mentioned above, increased transnational migration has posed new challenges to the existing educational system (see, e.g., Hong, 2010; Tsuneyoshi, 2004). A typical challenge is how to adjust the traditional monolingual and monocultural orientation in curriculum, instruction, and materials and how to improve educational policies, including teacher education, in order to accommodate the needs of learners and communities (see Banks, 2009).

At a wider societal level, neoconservative politics in the West that promote antagonism toward immigrants, particularly those of color and those from Islamic backgrounds, work against ensuring equity and fair treatment for newcomer populations in the host society. Conversely, many educational institutions celebrate superficial cultural diversity along with a neoliberal emphasis on internationalization, but still expect non-mainstream students to assimilate into the dominant culture and language. Discourses that critique the hegemonic process of assimilation do exist, however, and offer critical explorations of how difference is produced by power and how societies can become more equitable.

Multiculturalism is relevant to various dimensions of applied linguistics, such as language policy, language ideology, and language teaching and learning, including heritage language, bilingual, second language, and foreign language education. Second/foreign language teaching appears to inherently support multiculturalism because learning a new language is supposed to engage learners in explorations of new ways of understanding self and other. Perhaps because of this assumption, the field of applied linguistics has only recently begun to attend explicitly to issues of multiculturalism and multicultural education (Kubota, 2004a; Hoosain & Salili, 2005). An overview of the scholarship produced mainly in the USA reveals different responses to multiculturalism, indicating how multiculturalism is politically charged and how the ideological nature of multiculturalism is linked to some inquiry themes of applied linguistics.

Different Approaches to Multiculturalism

Multiculturalism is conceptualized in different ways in educational discourse. Scholars have offered different categorizations of various conceptual positions. For instance, Sleeter

and Grant (2007) present the following five approaches to multicultural education that have emerged since the 1960s in the USA: (a) teaching the exceptional and the culturally different approach, which purports a cultural-deficit theory for assimilating racial- and linguistic-minority students; (b) human relations approach, which advocates respecting, understanding, and tolerating difference; (c) single-group studies approach, which aims to enhance the understanding of particular groups; (d) multicultural education approach, which focuses on cultural pluralism and equal opportunities; and (e) multicultural social justice education approach, which advocates structural equality by critically addressing such issues as racism, classism, sexism, and homophobia.

Similarly, Steinberg and Kincheloe (2009) list five positions of diversity and multiculturalism: (a) conservative diversity practice and multiculturalism or monoculturalism, which privileges Eurocentrism as in the first approach described by Sleeter and Grant (2007); (b) liberal diversity practice and multiculturalism, which emphasizes commonality among individuals while overlooking structural inequalities; (c) pluralist diversity practice and multiculturalism, which focuses on differences but tends to exoticize them, constituting the mainstream approach to multiculturalism; (d) left-essentialist diversity practice and multiculturalism, which underscores and romanticizes the authenticity of diverse groups; and (e) critical diversity and multiculturalism, which critiques unequal power relations and envisions egalitarian democracy and social justice.

To conceptualize more generally, approaches to multiculturalism can be divided into conservative, liberal, and critical or racial (Nieto, 1995). The conservative camp or the political right considers the multiplicity of values brought by diverse groups to be a threat to social cohesion and thus insists on preserving the mainstream culture (e.g., White Christian values of the West). It might address diversity in the context of great non-Western civilizations in the past but it expects the contemporary non-mainstream diverse populations to abandon their cultural heritage and assimilate into the core mainstream culture.

Most prevalent is a liberal approach to multiculturalism in education. As suggested by Sleeter and Grant (2007) and Steinberg and Kincheloe (2009), this approach celebrates cultural pluralism and at the same time stresses individual equality. In making a distinction between liberal and critical approaches to multiculturalism, Kubota (2004a) explains that liberal multiculturalism superficially acknowledges multiculturalism as common sense, reinforces color blindness (or difference-blindness) by focusing on commonality, exoticizes and essentializes the other by focusing on difference, and obscures issues of power and privilege. In schools, colleges, and universities, a typical approach is cultural tourism, which merely surveys cultural artifacts and customs, or the so-called “four Fs approach”—food, fashion, festival, and folkdance—which celebrates cultural diversity in a trivialized and decontextualized way.

Liberal multiculturalism harmonizes the logic of difference and sameness. On the one hand, it promotes cultural essentialism by discussing unique characteristics of a certain culture, nation, people, or language, leading to stereotyping (see Kumaravadivelu, 2008). The emphasis on difference is partly based on the vision of cultural relativism that recognizes diverse cultures as different but valid in their own right. On the other hand, liberal multiculturalism emphasizes similarity and rationalizes equal treatment of all based on the idea that diverse people still belong to a single human race. This color-blind view supports individual meritocracy, ignoring how certain groups, due to their skin color or culture, are systematically and often subtly excluded, marginalized, or discriminated against in mainstream society. In this way, liberal multiculturalism tends to avoid confronting racism and, if racism is brought to attention, it is likely to be dismissed or reduced to a personal matter (e.g., prejudice, attitude, slur).

In contrast, a critical approach to multiculturalism explicitly focuses on racism, sexism, homophobia, and other social injustices at the collective level. It problematizes unequal relations of power among groups which privilege some while oppressing others. As such, racism is recognized not so much as a personal issue but rather as a structural or institutional mechanism of perpetuating a power hierarchy. Problematizing power is central to a critical approach to multiculturalism. Power produces and maintains social and linguistic unmarked norms which are made invisible or inaudible. For instance, Western societies often set heterosexual Christian middle-class White culture as the invisible norm in spite of increased local racial and cultural diversity brought about by globalization. Individuals who do not fit in this scheme are often disadvantaged in obtaining education, employment, and social status equal to the people who belong to the normative group. Moreover, male dominance in influential positions continues to be the norm in many societies. Critical multiculturalism attempts to make visible the invisible privilege attached to Whiteness, maleness, and heterosexuality and aims to transform the unequal relations of power.

Critical multiculturalism also problematizes the essentialist understanding of cultural, gender, and linguistic difference. A certain culture, for instance, is never homogeneous, fixed, or monolithically authentic—it is diverse, emergent, and ever shifting. Interrelated notions of cultural hybridity—the Third Space (Bhabha, 1994) or thirdness—index the possibility for cultural reinterpretation and appropriation, locating culture and identity in a fluid heterogeneous space. The essentialist understanding of cultural difference is questioned not only from the perspective of diversity and hybridity but also from the poststructuralist notion of discourse and power (e.g., Kubota, 2004b). Discourse constructs our knowledge, including that of cultural difference, and social practices. This allows multiple meanings of cultural difference; in other words, cultural essentialism can lead to harmful othering but it can also be strategically used to reclaim a subjugated identity. The plural meanings of essentialism also parallel the complex nature of hybridity. While the notion of hybridity is gaining popularity in applied linguistics, it tends to be romanticized and discussed without reflecting on the fact that language and culture have always been evolving through the process of mixing and that postmodern identity politics in many parts of the world are essentialist in nature (May, 2009).

Critically reflecting on the question of power and privilege and based on an anti-essentialist understanding of difference, critical multiculturalism is affiliated with radical and postfoundational inquiry approaches, including critical race theory, critical Whiteness studies, critical race feminism, critical pedagogies, poststructuralism, postmodernism, and postcolonialism.

As an educational practice, critical multiculturalism promotes critically reflective engagement rather than apolitical trivialization of difference. Instead of merely holding a once-a-year international day to celebrate ethnic or national traditions or addressing issues of diversity only with minority students, schools would engage all students in not only appreciation of diversity but also consideration of such critical issues as power, discrimination, subjugated local knowledge, race, gender, and economic inequalities at the local, national, and global level, and historical understanding of various kinds of domination and subordination throughout the curriculum at all times (Nieto & Bode, 2008). As a situated practice, critical multicultural education enables students to become aware of their relative positionality of privilege or oppression within specific contexts and to explore their social responsibility as democratic citizens. It also advocates mutual accommodation, which requires both the institution and the minority groups to share responsibility for constructing an equitable system for all (Nieto & Bode, 2008).

Although applied linguistics research rarely uses multiculturalism as an inquiry framework, the conceptual lenses discussed above are relevant to many issues in our field:

(anti)monolingual ideology, (anti)normatism, (anti)essentialist understanding of culture, and (anti)color blindness.

(Anti)monolingual Ideology

It is often assumed that language learning is an intellectually additive activity and thus it increases individuals' linguistic repertoires. Yet, in reality, this assumption does not apply to all contexts or groups of people. In many countries, proficiency in the dominant local language is a taken-for-granted requirement; in the case of the English-only movement in the USA, English proficiency is viewed as the only legitimate linguistic ability in the public domain. This view imposes acquisition of the language of power onto linguistic-minority groups, with minority children expected to become monolingual speakers of the dominant language. However, this monolingual ideology does not apply to the linguistic-majority population. Specifically, foreign language education for this group is linked to intellectual sophistication and access to higher education. Here we see elitist double standards—while additional language instruction is treated as remedial for one population, it is enrichment for another. In other words, the expectation is for monolingualism among linguistic minority and multilingualism for the linguistic majority (Wiley & Lukas, 1996). Language instruction thereby becomes a mechanism of perpetuating a power hierarchy and maintaining hegemony. Thus, teaching English as a second language (ESL) is often built on a deficit model, echoing one of the approaches discussed by Sleeter and Grant (2007) and Steinberg and Kincheloe (2009).

Monolingualism should be understood not so much as insistence on a single language but instead as logic of exclusion. In this sense, it constitutes language restrictionism. Even in Canada, a country with a national policy of multiculturalism and bilingualism, education for multilingualism beyond bilingualism in the two official languages is not formally promoted in schools because federal policy does not recognize non-official minority languages (Haque, 2010). Although bilingual education in languages other than French does exist in the Province of Alberta, as the school curriculum is determined by each province, Ontario prohibits school instruction to be delivered in languages other than English or French, restricting immersion education in languages other than French. Language restrictionism reinforces assimilation and the erasure of linguistic plurality.

In contrast, efforts have been made to preserve and develop the first language (L1) proficiency of minority groups through mother-tongue education in some parts of the world. These efforts include immersion education exclusively for minorities such as aboriginal students or dual-language education for both linguistic-majority and linguistic-minority students. Nonetheless, these efforts are not necessarily compatible with the vision of critical multiculturalism in that they could reinforce cultural and linguistic essentialism by emphasizing authenticity without recognizing multiple identities (Patrick, 2007) or subtly reinforce the unequal value of bilingualism unevenly afforded to the majority and minority groups, or even corroborate the accountability scheme which prioritizes raising students' test scores.

(Anti)normatism

Closely related to monolingualism is the prevalence of normatism in second language education and research. The standard variety of the target language spoken by native speakers is often set as the instructional goal and the yardstick against which second language (L2) learners' output is measured. These practices privilege mainstream language use and users while marginalizing others. Thus, foreign language instruction, despite its

purported goal of promoting linguistic and cultural diversity, could marginalize nonmainstream varieties of the language and heritage-language learners who are speakers of those varieties (Harklau, 2009).

Linguistic normatism has been problematized from several perspectives. Research on World Englishes has shed light on the unique characteristics of diverse varieties of English used around the world and recent scholarly discussions of lingua franca English have focused on the hybrid and fluid use of English among multilingual speakers. The concept of multicompetence of L2 users (Cook, 2007) has problematized the construction of legitimate L2 users as perpetual L2 learners or imperfect native speakers. Increased scholarly attention to the issues of non-native teachers of English demonstrates academic resistance to normatism. Although these scholarly developments have certainly pluralized the concept of language and legitimated diverse language use and users, they do not necessarily support the tenets of critical multiculturalism in that they may produce yet another norm, in the case of World Englishes (i.e., national standards of English) or may romanticize hybridity without addressing the unequal economic access to acquiring hybrid linguistic and cultural identity in the first place.

(Anti)essentialist Understanding of Culture

Culture is one of the central issues in applied linguistics research. Research in interlanguage or intercultural pragmatics and intercultural or contrastive rhetoric has investigated L2 learners' acquisition of oral or written conventions in the target language. In this inquiry, cultural differences between L1 and L2 are typically viewed as causing negative transfer, resulting in unconventional L2 output in need of remediation. This is where a great amount of cultural essentialism is produced in research. For instance, Western communication is typically described with notions such as individualism, low context, directness, clarity, and logicalness, whereas non-Western communication is characterized by such labels as collectivism, high context, indirectness, ambiguity, and intuitiveness (Kubota, 2004b). Such descriptions essentialize and dichotomize cultures and languages, creating a rigid boundary of the self and the other. This shares the emphasis on cultural difference and cultural relativism seen in liberal multiculturalism. In fact, the focus on cultural specificity in linguistic research may be seen as a progressive humanistic neo-Whorfian thought that challenges the Chomskyan approach to language which focuses on universalism. At the same time, the pedagogical implications drawn from research tend to support normative and assimilationist expectations of acquiring the dominant conventions.

Cultural and linguistic essentialism has been challenged by empirical studies that have a descriptive rather than prescriptive orientation with a focus on variability within cultural and linguistic practices. While these efforts are situated in a positivistic paradigm that seeks objective facts, a poststructuralist critique views cultural and linguistic essentialism as discursively constructed within colonialism, nationalism, and international politics (Pennycook, 1998; Kubota, 1999). Such anti-essentialist approaches to culture and language parallel critical multiculturalism.

(Anti)color Blindness

In teaching L2 learners of color especially in public school settings, teachers and administrators are likely to state that they see no color among students and thus they treat them equally. This echoes liberal multiculturalism in overlooking the racism and structural inequalities that affect different groups of students in divergent ways. Unwillingness to confront racism is manifested in the contemporary discourse of cultural racism or new

racism, in which cultural difference becomes a proxy for racial difference. In addition, the linguistic labeling used to designate ESL students in schools may in fact index racial categorization in the sense that native speakers of nonstandard varieties of English who are children of color tend to be assigned this linguistic label (Motha, 2006). This phenomenon indicates how race often intersects with non-nativeness assigned to learners and teachers. Thus, discrimination against non-native-speaking teachers in the classroom and in the hiring process reflects not only linguistic issues but also racial labeling. Furthermore, race and language intersect in complex ways within institutional politics in a wider society. For instance, a White native speaker of English who is a non-native teacher of a foreign language in an English-dominant society might have more privilege than a native-speaking teacher of color who is a non-native speaker of English.

These subtle lines among race, language, and culture have recently been explicitly discussed in applied linguistics. Critical scholars have revealed explicit or implicit racism in discourses among educators, instructional practices, teaching materials, experiences of students and teachers of color, and language policies through theoretical inquiry and qualitative methodology including critical race theory. Some scholars have conducted research on antiracist interventions for raising students' critical awareness of their racial identity and privilege.

Conclusion

Multicultural conditions as reflected in cultural and linguistic diversity and hybridity are spreading in many societies around the world, while cultural and linguistic assimilation continues to be imposed on minority groups. At the same time, resistance to such hegemonic force has produced strategic essentialism as seen in the reclamation of minority rights and nationalism in diaspora communities. Under these circumstances, cultural difference has many symbolic meanings—an obstacle to national unity, an object of fetishism, an imposed essentialism that creates othering, and strategic essentialism. Applied linguistics research has also responded to linguistic and cultural plurality in various ways—from essentialist relativism to critical problematization. As neoliberal politics increasingly influence language teaching and learning with an emphasis on accountability, communication skills for employability, linguistic instrumentalism, and English as an international language, racial, gender, and socioeconomic gaps in language learning and teaching would be a significant topic of further investigation from a perspective of critical multiculturalism.
